**HILGARD, EUGENE WOLDEMAR.** An American agriculturist, died Jan. 8, 1916, at Berkeley, Cal. He was born in Bavaria in 1833, but was brought as an infant to the United States. In 1853 he received the degree of Ph.D. at Heidelberg and later he studied at Zurich and Freiberg. From 1858 to 1872 he was State geologist of Mississippi, from 1866 to 1873 served as professor at the University of Mississippi; and then for two years he held a chair at the University of Michigan. But he was best known for his connection with the University of California, which lasted, actively, from 1875 till his retirement in 1900 under the Carnegie Foundation. From 1888 to 1904 he was also director of the California Agricultural Experiment Station, which was the first of its kind and which owed its existence to Professor Hilgard's persistent efforts. His success in interesting the farmers resulted in other stations and in

farmers' institutes. Of especial importance were his soil investigations—he published a standard book on *Soils of the Humid and Arid Regions* (1906). Professor Hilgard's distinction was recognized by his election to the National Academy of Sciences, by honorary degrees from Columbia and other universities, and by the award of the Liebig medal of the Academy of Sciences of Munich and of a gold medal at Paris in 1900. He was a cousin of the late Henry Villard, whose name was originally Hilgard.

**HILL, JAMES J (EBOME).** An American railway builder and capitalist, died at St. Paul, Minn., May 29, 1916. He was born at Guelph, Ontario, Canada, Sept. 15, 1838, of Scotch-Irish parentage. On the death of his father, which occurred when he was 15, he left Rockwood Academy to work on a farm. Three years later he decided to look for work in the United States, and after going from place to place observing conditions, he settled in St. Paul, then a small town, where he was first a stevedore and clerk for a river packet company. He began immediately to study the possibilities of transportation development in the Northwest. By 1865 he had become agent for the Northwest Packet Company, soon afterward representative for the St. Paul and Pacific Railroad, and in 1869 helped to organize the fuel and transportation business of Hill, Griggs, and Company. Although the railroad known as the St. Paul and Pacific had gained a reputation for being little more than a name, and certain Dutch financial backers had withdrawn their support so that in 1873 it went into the hands of a receiver, James J. Hill saw what could be made of it. He secured the interest of two Canadians subsequently famous, Donald A. Smith, later Lord Strathcona, and George Stephen, later Lord Mountstephen. With them, and the assistance of John S. Kennedy, a New York banker, he secured the property and proceeded to develop it. A three years' pest of grasshoppers, 1874-76, was followed by a remarkable harvest year, and farmers eagerly sought land along the railroad, which came to be known as the St. Paul, Minnesota and Manitoba, and later as the Great Northern. Of this Mr. Hill became president in 1882. His proposal to extend it westward to the Pacific was ridiculed, for there were already three transcontinental roads to the south, which had been aided by the government; but the proposal became a reality. Subsequently, to connect this road with China and Japan, a fleet of great ocean liners was built to operate from Puget Sound; also by way of the Great Lakes, connection with Buffalo was secured.

A bitter rivalry was carried on with the Northern Pacific, which finally collapsed in 1893, and was put in the hands of a receiver. If the Supreme Court of the United States had not held that such action would constitute the formation of a monopoly, the Great Northern would have absorbed its former rival. However, through the aid of J. P. Morgan and Company, virtually the same end was reached, by reorganizing the Northern Pacific and turning over control of it to the men controlling the other road. The Burlington Railroad was also obtained to give entrance to Chicago. For some years the formation of a holding company had been contemplated, to insure the then owners that their stock would have permanent control even after their death. A sudden check to this

plan was received when in the spring of 1901 it became known that Edward H. Harriman, backed by Kuhn, Loeb and Company, bankers, had instituted a struggle to get control of the Northern Pacific and the Burlington. May 9th of that year was the date of the great Northern Pacific corner. The battle ended in a draw, for it was found that while Harriman had not acquired a majority of the common stock and a majority of preferred, he had a majority of the two together. The attempt was then made by Hill to form a holding company, the Northern Securities Company. This was held to be illegal by the United States Supreme Court, in one of the most memorable of decisions regarding trusts, but it happened that the reorganization as required operated to Harriman's disadvantage.

James J. Hill came to be regarded throughout the Northwest and the country as not only a great railroad promoter, but a great developer of the resources of the land and of commerce, an "empire builder." He interested himself deeply in problems of farming. He found that in years of a poor wheat crop the result meant failure for the farmers, and consequent loss to the railroad. To set an example, he bought 1000 blooded bulls and 10,000 pedigreed hogs, which he distributed; and soon his road was making a record carrying live stock. One of the most remarkable aspects of Mr. Hill's genius was his ability to plan for the running of a railroad on the most thrifty and effective lines, as well as to project it. He took the road that became the Great Northern when it could be bought for \$300,000 (in 1879), and within four years it was valued at nearly \$40,000,000. The equipment was paltry and the total mileage was only 600. In 1893, when this had risen to 4300, the road was capitalized at \$143,000,000. Mr. Hill was ridiculed when he said that a railroad should be able to operate at a cost not exceeding 55 per cent of its gross earnings, but in 1898 the record of the Northern Pacific was 48.02 per cent. In 1907 he retired from the presidency of the Great Northern, and in 1912 from the chairmanship of the board of directors. His son, Louis W. Hill, took his place.

Mr. Hill was interested in a wide variety of public questions, and used to discuss his views for newspapers, and to make addresses, especially on the development of the land. He also published in 1910 a book called *Highways of Progress*. It was part of his scheme for arousing public interest and improving farm life to send over his roads cars for the demonstration of scientific agricultural methods. He had only the severest censure for inflated trusts, and was a strong advocate of national economy. Yale University recognized his services by the degree of LL.D in 1910, and at Harvard some of his friends established in his honor the Hill professorship of transportation. In 1908, before the Conference of Governors in Washington, he made a notable address on "The Natural Wealth of the Land and Its Conservation."

He made a number of large benefactions, chiefly to religious and educational institutions in St. Paul. A Presbyterian himself, his wife was a Roman Catholic, and he gave with equal generosity to Catholic and Protestant churches. He is said to have contributed, with his wife, \$1,500,000 to the new \$3,000,000 Catholic cathedral in St. Paul, and one of his other gifts was \$500,000 to build the St. Paul Theological Sem-

inary. He made a large and notable collection of works of art, which he housed in the gallery of his great home in St. Paul. At the time of his death, his wealth, including railroads and valuable iron mine interests, was estimated at between \$100,000,000 and \$250,000,000. During the long period while he headed the Great Northern, he never received a salary, but drew his income from the securities he owned, sharing in the benefit from increased value of the property.

**HILL, JOHN ALEXANDER.** An American publisher, died at East Orange, N. J., Jan. 24, 1916. He was born near Bennington, Vt., in 1858, but his family early removed to Wisconsin, and Mr. Hill entered a printing office at 14. For eight years after he was 20, he ran a locomotive, but his main interest was in printing and in the machinery for this trade. The year 1885 he spent in editing the *Daily Press* of Pueblo, Col., which he had founded, and after he had become known as a writer of his own experiences in railroading, he was called to become editor of the *American Machinist* (1888). This journal he bought, with Angus Sinclair, in 1896, and in 1902 Mr. Hill acquired *Powder* and organized the Hill Publishing Company. At the time of his death this corporation was housed in a great model building in New York, known as the "house of glass," in which even the machinery is painted white. The company acquired the *Engineering and Mining Journal*, the *Engineering News*, and founded the *Coal Age*. Mr. Hill introduced many important innovations into publishing policy, and did much to improve printing machinery.

**HINDENBURG, PAUL VON BENECKENDORF UND VON.** See WAR OF THE NATIONS.

**HISTORICAL ASSOCIATION, AMERICAN.** The thirty-second annual meeting of the Association was held at Cincinnati, Ohio, Dec. 17-30, 1916. At the same time, the American Political Science Association, the Mississippi Valley Historical Association, and the Ohio Valley Historical Association met. Prof. Jesse Macy, president of the Political Science Association, addressed a joint meeting on the "Scientific Spirit in Politics," and Prof. George L. Burr, president of the American Historical Association, spoke on "The Freedom of History." At different meetings, ancient, general, English, and American historical subjects were discussed. One session was devoted to "American Colonial Policy in the Philippines," another to "Medieval and Modern Constantinople," and a third, of particular interest at present, to "Great Peace Congresses of the Nineteenth Century." Of this meeting Prof. George M. Dutcher was chairman, and the Congresses of Vienna, Paris, and Berlin were discussed by Charles D. Hazen, William R. Thayer, and Robert H. Lord, respectively. Conferences were held of historical societies, of teachers, and of archivists. The Historical Association publishes an *Annual Report* and a quarterly journal entitled *The American Historical Review*. In alternate years the Herbert Baxter Adams and Justin Winsor prizes are awarded for monographs on European and American history, respectively. In 1916 *The Leveller Movement*, by Theodore C. Pease (awarded the Adams prize in 1915), was published. At the 1916 meeting the following officers were elected: President, Worthington C. Ford; first vice-president, William R. Thayer; second vice-president,

Edward Channing. Waldo G. Leland was re-elected secretary and Clarence W. Bowen treasurer. In 1916 there were 2900 members.

**HISTORY.** See section so entitled in articles on various countries; also FRENCH LITERATURE; GERMAN LITERATURE; LITERATURE, ENGLISH AND AMERICAN; etc.

**HITCHCOCK, GILBERT MONELL.** Relected Democratic United States Senator from Nebraska, Nov. 7, 1916.

**HOBART COLLEGE.** A nonsectarian institution for the education of men, at Geneva, N. Y. It was founded under Protestant Episcopal auspices in 1822. With it is affiliated William Smith College for women. In the fall of 1916 Hobart College had 122 students and 21 faculty members. The productive funds of the institution amount to \$748,891 and the total income from all sources for 1916 was \$90,000. The library has 59,000 volumes. President, Lyman P. Powell.

**HOCKEY.** The seven of the Boston Athletic Association won the championship of the Amateur Hockey League after a sensational struggle. When the regular schedule of games had been played the Boston team and the St. Nicholas Club of New York City were tied for the lead. In the play-off series Boston captured two of the three contests. The final standing of the clubs in the league follows: Boston A. A., won 8, lost 3; St. Nicholas, won 7, lost 3; Harvard Club, won 4, lost 4; Crescent A. C., won 4, lost 4; Hockey Club, won 0, lost 8.

The world's championship was captured by Les Canadiens after an exciting series with the Portland Oregon Club. Five games were necessary to decide the outcome, the scores being: Portland 2, Les Canadiens 0; Les Canadiens 2, Portland 1; Les Canadiens 6, Portland 3; Portland 6, Les Canadiens 3; Les Canadiens 2, Portland 1.

One of the strongest teams of the year was the Duquesne Garden aggregation of Pittsburgh, which won 20 games and lost only 3. The Cleveland, Ohio, seven captured 20 contests, lost 4 and drew 1.

Harvard again proved the best of the college teams.

**HOG CHOLERA.** See VETERINARY MEDICINE.

**HOGS.** See STOCK RAISING AND MEAT PRODUCTION.

**HOLCOMB, MARCUS H.** Relected Republican Governor of Connecticut, Nov. 7, 1916. See CONNECTICUT.

**HOLLAND.** See NETHERLANDS.

**HOLY CROSS, COLLEGE OF THE.** A Roman Catholic institution for the education of men, at Worcester, Mass. It was founded in 1842. The instructors numbered 44 in the fall of 1916 and the students 597. The Rev. Francis X. A. Byrne, S.J., became prefect of discipline. The noteworthy benefactions of the year include \$10,000 each from the Rt. Rev. Thomas D. Beaven, class of 1870, and from Mr. Richard Healey. Productive funds amounting to \$82,675 yielded an income in 1916 of \$3000. The library contains 50,000 volumes. President, Rev. Joseph N. Dinand, S.J.

**HOME ECONOMICS.** See AGRICULTURAL EXTENSION WORK.

**HOME RULE IN IRELAND.** See GREAT BRITAIN, *History.*

**HONDURAS.** A Central American republic, bounded by the Caribbean Sea on the north and by Salvador and Nicaragua on the south, and touching the Pacific at the Gulf of Fonseca. The capital is Tegucigalpa.

**AREA, POPULATION, ETC.** Pending the delimitation of the Guatemalan boundary, the area of Honduras cannot be stated exactly. The figure that seems best for present acceptance is 114,670 square kilometers (44,274 square miles). The estimated number of inhabitants, who are chiefly Indian, was 592,675 at the end of 1913. There were 22,684 births in 1913 and 10,192 deaths. The largest town, Tegucigalpa, had 22,137 inhabitants in 1910 (1914 estimate, 28,950); Santa Rosa, 10,574; Juticalpa, 10,520; Danté, 8477; Nacaome, 8152; Choluteca, 8065.

Elementary instruction is free, secular, and nominally compulsory. The number of elementary schools reported for 1913 was 916, with an enrollment of 40,565 pupils, an average attendance of 25,917, and 1138 teachers. For secondary education the government maintains an institute at Tegucigalpa and subsidizes colleges in the departments. At Tegucigalpa also the government supports a so-called university and at Comayagua a law school. There are normal schools at Tegucigalpa, San Pedro Sula, Comayagua, Santa Rosa, and Santa Bárbara. Roman Catholicism is the prevailing religion, but there is no state church.

**PRODUCTION AND COMMERCE.** As reported in 1916, Honduras has over 3000 plantations and farms under cultivation, representing an area of about 117,300 hectares (about 289,400 acres), of which 15,400 hectares (38,000 acres) are irrigated. The most important crop commercially is bananas, which are cultivated especially along the Caribbean coast. The estimated banana crop of 1915 was 6,069,379 bunches. The corn crop provides the staple food of the people. Other crops are sugar cane, tobacco, coffee, coconuts, rice, beans, millet, and yucca. (See AGRICULTURAL EXPERIMENT STATIONS.) Grazing is an important industry; cattle numbered 489,185 in 1914, horses 68,059, mules 24,700, goats 22,778, and swine 180,092. Some gold and silver are mined, but there is little other development of the country's extensive mineral resources. Manufacturing is unimportant; the only manufactures of any account exported are cigars and Panama hats.

Imports and exports have been valued as follows in fiscal years:

	1913	1914	1915
Imports .....	\$5,132,678	\$6,624,930	\$5,874,780
Exports .....	8,300,254	8,421,331	8,857,857

The following figures, representing thousands of silver pesos, show for the fiscal years 1913 and 1914 the relative value of exports: bananas, 2759 and 1714; coconuts, 97 and 220; coffee, 62 and 116; hides, 77 and 160; cattle, 251 and 1914. Trade for fiscal years by principal countries, in thousands of dollars (gold):

	Imports		Exports	
	1914	1915	1914	1915
United States .....	5,262	5,177	2,974	2,987
United Kingdom .....	460	803	18	1
Germany .....	522	96	165	1
France .....	142	55	5	....

**COMMUNICATIONS.** Means of communication and transport are not at all adequate to the needs of the country. The repair and construction of roads is being carried on to some extent by the government, which in 1915 expended about 432,800 pesos on roads focusing at Tegucigalpa—one from the coast, another from Olancho, and a third from the direction of the National Railway via Comayagua. Tegucigalpa is the only Latin-American capital without a railway. The greater part of the railway in operation consists of lines built primarily for transporting the banana crop. The total length at the beginning of 1916 is reported at 517 kilometers. The most important line is the National, which extends inland from the coast at Puerto Cortés. In 1915 there was completed on this line a bridge over the Ulua River. Telegraphs (1914), 6890 kilometers (4281 miles) of wire, with 259 offices; as reported for the end of 1915, 7830 kilometers (4865 miles) of wire. Post offices, 278.

**FINANCE.** The standard of value is silver. The monetary unit is the peso, whose gold value fluctuates. At the beginning of 1914 it was worth about 43.4 cents; 1915, 39.8 cents; 1916, 35.4 cents. Revenue is derived chiefly from customs and from monopolies of spirits, tobacco, and explosives. For the fiscal year 1915, revenue and expenditure amounted to 6,682,891 and 6,461,467 pesos respectively, as compared with 5,895,194 and 5,774,415 pesos for the fiscal year 1914. The foreign debt, with arrears of interest from 1872, amounted to £30,803,868 at the end of 1914. The internal debt at the beginning of 1916 stood at 4,165,475 pesos.

**GOVERNMENT.** The executive authority is vested in a president, who is assisted by a cabinet of five members. The legislative power is exercised by a unicameral congress of 42 members. The president, the vice-president, and members of the congress are elected for four years by direct vote; the president is not eligible for the next term. The suffrage is held by male citizens over 21 years of age (or 18 years if married) who can read and write. On Feb. 1, 1912, Gen. Manuel Bonilla and Francisco Bertrand were inaugurated president and vice-president respectively. On March 13, 1912, Bonilla died and was succeeded by Bertrand. In 1915 Bertrand, with the consent of the Congress, resigned in order that he might become a candidate for the ensuing term; the executive authority was assumed by the vice-president, Alberto Membrefio, for the period Aug. 1, 1915, to Feb. 1, 1916. On Oct. 24, 1915, Bertrand was elected president and Membrefio vice-president by a virtually unanimous vote for the term beginning Feb. 1, 1916. Honduras is divided into 17 departments and one territory, which are administered by governors appointed by the president. See UNITED STATES, *Treaties*.

**HONGKONG.** A British crown colony; an island (about 32 square miles) off the southeast coast of China. Included in the colony are a strip of territory on the main land leased from China (376 square miles) and about four square miles of the Kowloon Peninsula. Civil population, 456,739 (Chinese, 444,664). Capital, Victoria (219,755). The island is the centre of an enormous trade. Being a free port, no trade returns are available, but a record of the shipping gives some idea of the extent of the trade.

The total tonnage entered and cleared in 1914 was 36,756,951, a decrease of 986,031 tons compared with 1913. There were 258,535 arrivals, of 18,383,764 tons, and 258,904 departures, of 18,373,187 tons.

Shipbuilding and repairing are important industries. A railway from Kowloon to the Chinese frontier joins the line from Canton. The total revenue (1914) is estimated at \$11,007,273; expenditure, \$10,756,225. Hongkong is well situated as regards telegraphic communication with all parts of the world. A railway from Kowloon joins the line from Canton at the frontier.

Proclamations dated Sept. 17, Oct. 1-29, Dec. 10-17-24 and 31, 1915; Jan. 21, March 17-24, 1916, have been issued by the Hongkong government, prohibiting export of raw cotton, corn or corn meal, oats or oatmeal, rice or rice flour, rye or rye flour, and wheat or wheat flour, to all ports in Europe and on the Mediterranean and Black Seas other than the United Kingdom, France, Russia (except through Baltic ports), Italy, Spain, and Portugal, and of linseed to all destinations other than the United Kingdom, British possessions and protectorates, Italy, France, and Russia (except through Baltic ports).

**HOPKINS, ERNEST MARTIN.** An American educator, inaugurated president of Dartmouth College, Oct. 6, 1916. He succeeded Dr. Ernest Fox Nichols, under whom he had served as secretary of the college.

**HOPS.** The hop yield of the United States in 1916 according to estimates by the Department of Agriculture was 50,537,000 pounds produced on an area of 43,900 acres, the average yield per acre being 1152 pounds. The corresponding figures for 1915 are given as 52,986,000 pounds, 44,700 acres, and 1187 pounds respectively. The farm value of the crop on Dec. 1, 1916, was 12 cents per pound, making the total value at this rate \$6,071,000 as compared with 11.7 cents per pound and a total value of \$6,203,000 the year before. Commercial estimates placed the yields in the principal hop producing States as follows: California, 112,000; Oregon, 90,000; Washington, 28,000; and New York, 10,000 bales of about 200 pounds each. The average production in New York was estimated at only about 500 pounds per acre. The supplies in New York State were so short that choice hops on account of the scarcity and the demands from brewers sold for 50 to 55 cents a pound, while in the Pacific Coast States the price ranged from 11 to 16 cents at the same time. These purchases were made to replace the Bavarian and Bohemian hops which could not be secured under the disturbed commercial conditions. By November practically the whole of the New York crop had been disposed of by the growers. The crop on the Pacific Coast was largely reduced by mold. In England the hop yield was only 308,000 cwts., one of the smallest on record. The hop crop of Germany was estimated at 16,534,000 pounds as compared with 30,751,194 pounds in 1915 and the yield in Austria at 21,053,930 pounds as compared with 20,613,010 pounds the year before. Many hop yards on the Continent, especially in Bavaria and Bohemia, were plowed up on account of unprofitable prices. For the year ending June 30, 1916, the breweries of the United States consumed about 37,500,000 pounds of hops.

**HORSES.** See STOCK RAISING AND MEAT PRODUCTION.

**HORSLEY, SIR VICTOR ALEXANDER HADEN.** A British surgeon and pathologist, died July 16, 1916, in Mesopotamia, where for several months he had been a medical consultant to the army. The son of a Royal Academician, he was born at Kensington in 1857, and received his professional training at University College Hospital, London. Among the offices he had held were: Professor-superintendent of the Brown Institution (1884-90); secretary to the Royal Commission on Hydrophobia (1885); Fullerian professor at the Royal Institution (1891-93); professor of pathology at University College (1893-98); and professor of clinical surgery at University College Hospital, from which post he retired in 1906. Sir Victor, who was knighted in 1902, received many other honors, including the Lannelongue international prize in surgery (1911), the royal medal of the Royal Society, the Cameron and Fothergill gold medals, honorary membership in the great scientific societies of the world, and university degrees. He made important contributions to the surgery of the brain and to the study of the ductless glands. One of his achievements was the discovery in 1884 that the disease myxœdema was caused by the absence of the thyroid gland. Sir Victor identified himself actively with public health movements, especially as concerning school children, national sick insurance, and temperance, and enthusiastically supported woman suffrage. His important writings were largely contributed to medical journals and the proceedings of societies.

**HORTICULTURE.** The year 1916 was one of low yields for fruits and vegetables generally. Most European countries reported a scarcity of labor to properly care for crops in special need of attention because of conditions favorable to plant diseases. The shortage was less severe in the Mediterranean districts, but transportation facilities were bad. Most of the fruit crops of Canada and the United States were below normal. The fruit districts of the Pacific Coast region suffered least from inclement weather conditions. The commercial vegetable crops, notably Irish potatoes and cabbage, were very short. According to the Bureau of Crop Estimates of the United States Department of Agriculture the nine leading cabbage-producing States had a production of 246,988 tons, with a farm value on December 1st of \$52.20 a ton in 1916, as compared with 670,631 tons, with a farm value of \$19.40 per ton in 1915. The potato crop was estimated at 285,437,000 bushels, with a farm value of \$1.46 a bushel on December 1, 1916, as compared with 359,721,000 bushels, with a farm value of \$.61 a bushel in 1915. The commercial apple crop in the United States amounted to about 30,000,000 barrels, as compared with 40,000,000 barrels in 1915. Less than 25,000 cars of peaches were marketed in 1916 as compared with about 45,000 cars in 1915. California shipped 45,234 cars of citrus fruits and about 18,000 cars of fresh deciduous fruits in 1916 as compared with 46,862 cars of citrus fruits and 16,778 cars of fresh deciduous fruits in 1915. Florida shipped about 24,000 cars of citrus fruits as compared with about 25,000 cars in 1915. The principal canned vegetable packs were 13,142,000 cases of tomatoes, 9,130,000 cases of corn, 8,686,000 cases of peas in

1916, as compared with 8,469,000 cases of tomatoes, 10,124,000 cases of corn, and 9,272,000 cases of peas in 1915. California packed 972,550 cases of asparagus in 1916 as compared with the largest previous pack of 800,380 cases in 1915.

**EXPORT TRADE.** For the fiscal year ending June 30, 1916, the United States exported fruits worth \$36,073,051; vegetables, \$15,952,412; nuts, \$892,277, or a total of \$52,917,740, as compared with \$45,746,268 in 1915. The imports for the same period were fruits, \$23,285,816; vegetables, \$10,811,393; nuts, \$21,160,491, a total of \$55,257,700, as compared with \$53,230,927 in 1915. British restrictions were responsible for reduced exports of fresh, canned, and dried fruits. The restrictions were partially removed on September 1st, shipments to be limited to 50 per cent of the previous year's exports. Of stocks required for the armies, such as beans, peas, and potatoes, \$9,399,938 worth were exported in 1916, as compared with \$5,984,257 in 1915. Nursery stock worth \$3,686,348 was imported in 1916.

The shipments of Australian fruits to Great Britain were replacing American shipments. For the fiscal year ending June 30, 1916, 411,198 cases of Australian apples were received in the port of Liverpool, as compared with 65,850 cases in 1915. In New Zealand, where the fruit industry was being rapidly extended, a law passed at the previous session of Parliament provided for the registration of every fruit tree in the dominion on or before Oct. 26, 1916. The trees were to be inspected for diseases, and orchards of one acre or more were to be taxed 24 cents per acre with the idea of using the income for developing the fruit industry in the dominion. Shipments of Portuguese dried figs to the United States in 1916 amounted to 10,670,888 pounds valued at \$431,288, as compared with 2,590,141 pounds valued at \$112,918 in 1915. The greater part of this fig crop usually was shipped to Germany and Russia by the way of Holland. The blockade of so many European markets also was responsible for greatly increased shipments of Spanish onions and olive oil to the United States.

**PLANT QUARANTINES AND REGULATIONS.** As a result of the work of the Federal Horticultural Board a number of insect pests and diseases have been detected recently in nursery stock imported into the United States, and the dangerous material has been rendered innocuous. New rules and regulations governing the importation of nursery stock into the United States were issued by the board and became effective on and after July 1, 1916. In the revised regulations permits were provided for the importation of nursery stock from countries which maintain nursery stock inspection and for the importation of orchids and tree seeds from those which did not maintain such inspection. These permits were valid until revoked. California declared an absolute quarantine against all imported citrus fruits, trees, buds, and scions. The quarantine was made primarily to prevent the reshipment from other States of citrus fruits from canker-infested districts of Florida. Early in the year Australia placed an embargo on American fruits. This was removed for the States of California and Arizona, providing that the quantity of the shipment must be made known and the fruit must be free from all citrus canker and disease. The Federal government made cooperative ar-

rangements with State officials of Florida, Texas, Louisiana, Mississippi, Alabama, Georgia, and South Carolina to insure the thorough inspection of nurseries and citrus groves for the purpose of promptly and completely eradicating citrus canker.

**MARKETING FRUITS AND VEGETABLES.** The results of fruit-handling investigations conducted by the United States Department of Agriculture during the past few seasons show that the most important factor in determining the condition of either fruits or vegetables in transit and after arrival on the market is the temperature maintained in refrigerator cars during transportation. The investigations during the past season have had mainly in view the improvement of refrigerator-car equipment. The results of the work thus far showed that through certain modifications in the ice bunkers, through the use of racks or false floors, and through better insulation, it was entirely practicable to increase the efficiency of refrigeration and to haul larger loads of fruit than formerly and with a lesser ice consumption. Probably the most important development in these investigations was the practicability of using small amounts of salt during the first two icings in cars with modified bunkers and racks, to accomplish a quick cooling, comparable to pre-cooling in either warehouses or car pre-cooling plants, with practically no extra cost and no delay for pre-cooling. Under this method the packed fruit was subjected to less handling and it made possible the long shipment of tree-ripened or more fully matured fruit in good condition, thus supplying the consumer with a product possessing its maximum fine quality. The Department's work in California during 1916 demonstrated the necessity of more careful handling of muskmelons. A large percentage of the deterioration in transit and on the market was traced directly to rough handling in the field and in the packing and loading sheds. When melons were picked before ripening, the deterioration was less than in riper fruit, but a large part of the crop reached the eastern market in a condition unfit for consumption.

A government market news service for perishable crops was established early in the year. Reports on carlot shipments of perishables were received daily at Washington and immediately telegraphed to the principal market centres. The information was made available at Washington and the field stations to national press associations and local papers. Shipping data, morning quotations, and other information from 31 markets covered by the service were furnished individuals and associations willing to pay the telegraph tolls. The commercial crops reported during 1916 included strawberries, tomatoes, cantaloups, peaches, onions, asparagus, watermelons, pears, prunes, grapes, apples, and white potatoes.

**RECENT DEVELOPMENTS IN SPRAYING.** The results of tests made under the direction of the Canadian Department of Agriculture showed that arsenate of lime might be used as a substitute for arsenate of lead as the insecticide in the usual lime-sulphur-arsenate of lead spray, and thereby greatly reduce the burning of apple foliage frequently caused by lime-sulphur and arsenate of lead. In view of the successful results secured during one season with hydrated lime as a substitute for stone lime in making

lime-sulphur spray for peach diseases, the Virginia Experiment Station recommended a trial of hydrated lime and sulphur to peach growers. The principal advantage to be gained was the saving of time and labor in preparing the spray. Experiments conducted for a number of years at the New York Cornell Station showed that the control of apple diseases and insect pests with dusting machines was somewhat less efficient than the liquid spray method; at the same time it was much more satisfactory for use in small orchards where expensive spraying equipment was out of the question, and also as an adjunct to liquid spraying equipment in large orchards where a large amount of spraying must be done within a short time. Underground piping systems for conveying spraying materials were being successfully used in some West Virginia and California orchards. The results reported by the Pennsylvania Station indicated that fruits and vegetables badly stained with Bordeaux spray might be rapidly cleaned by dipping them in a solution of acetic acid, used at the rate of half a cupful of pure acetic acid to two gallons of water. This results in the formation of acetates which are removed by passing the fruits or vegetables under running water. Experiments conducted by the United States Department of Agriculture showed that a decoction of *Amianthium muscaetoxicum*, known locally as fly poison or crow poison, when used as a spray will successfully control potato beetles and the fall web-worm.

**FRUIT BY-PRODUCTS.** During the year the Department of Agriculture completed a method for the manufacture of citrate of lime from lemons. The green fruit of tangerines was found to be valuable as a source of citric acid. A fine orange vinegar was manufactured on a small commercial scale. A machine was invented for the economic removal of the oil-bearing portion of the rind of waste and cull oranges and other citrus fruits. A simple, practical, and inexpensive method of manufacturing sweet-orange oil was devised. Studies in the manufacture of marmalade stock were undertaken and improved methods for the preparation of jams and jellies worked out. Much assistance was rendered manufacturers in improving their methods and utilizing their waste products.

**PROMISING FRUITS AND PLANTS.** The best recent fruit introductions tested on the New York State Experiment Station grounds included the Perfect apple, Rochester peach, Reine Hortense cherry, Empire State grape, and Herbert raspberry. The publishers of the *Missouri Fruit Grower* announced a Golden Winesap apple of high quality. The New York Station and also the New Mexico Station found it practicable to grow many of the high-yielding European grapes, commonly grown in California, by giving them some winter protection. The cheapest and best method of protection consisted in laying the vines down after leaf fall and covering them with a few inches of earth. At the Massachusetts Asparagus Substation a number of strains of asparagus were developed which possessed both excellent commercial characteristics and, to a high degree, the capacity to resist attacks of rust. At the Georgia Station, a pear of the Garber type, slightly superior to the Kieffer pear in quality, was found to be practically immune from blight. The Chinese downy chestnut trees (*Castanea mollissima*) distributed by the

United States Department of Agriculture in 1907 proved to have a high resistance to the serious chestnut blight so destructive to American chestnuts. The Chinese trees fruited and could be relied upon to furnish good nuts for the trade. The acquisition through the gift of the municipality of Tokyo of bud wood from the famous Arakawa collection of flowering cherry trees and their propagation on introduced Japanese cherry stocks put the Department in a position to give a wide trial in the near future to the hardiness of these superbly beautiful trees as dooryard and park trees. Inarched plants of the Chinese litchi first distributed in 1909 were fruiting in 1916 in Florida, where this fruit tree might be expected to live and bear if the young plants could be protected, or at least escape severe frosts until they had become thoroughly established. The quality of the fruits produced in the United States was excellent.

**INSTITUTIONS, SOCIETIES, ETC.** An organization to be known as the National Congress of Horticulture was effected at Washington, D. C., Nov. 17, 1916, as a result of a meeting of representatives of horticultural societies called by the American Pomological Society. The scheme of the organization in its entirety contemplates an actual congress meeting annually and having an active voting membership of from 500 to 600, with a corresponding attendance at its sessions, which would be business meetings for the discussions of the interstate, national, and international fruit, flower, vegetable, ornamental, seed, and plant problems of the United States.

Beginning with the current academic year, Vassar College offered courses in horticulture and landscape gardening. At Nebraska University courses in farm forestry and landscape gardening have been opened under the department of horticulture. Illinois University recently completed a genetics building and plans are under way for a horticultural field laboratory. During the summer the University of California let a contract for about \$100,000 for buildings at the new Citrus Experiment Station, at Riverside, Cal. The National School of Horticulture at Versailles has established a special section of gardeners' apprentices for retraining soldiers mutilated during the war. Applicants for this course are required to have more or less complete use of two arms and to have already had an agricultural or horticultural profession.

**NECROLOGY.** On August 3rd Jackson Dawson, one of the leading horticulturists of the country, died at Arnold Arboretum, Jamaica Plain, Mass., in his 75th year. Prof. William R. Lazenby, associated with the Ohio State University since 1881 and one of the pioneer educators in horticulture, died September 15th at the age of 66 years. Dr. Albert J. Cook, State horticultural commissioner of California since 1911, died September 29th, at the age of 74 years. The planting of 90,000 olive trees is the monument chosen by friends to commemorate Herzl, a prominent Zionist, and his work.

**Bibliography.** Among the contributors of 1916 to horticultural literature were the following: L. H. Bailey, *The New Standard Cyclopaedia of Horticulture* (vols. iv and v, New York); A. Pucci, *Enciclopedia Orticola* (vols. i-iv, 1910-1916, Turin); E. H. Wilson, *The Cherries of Japan* (Publ. Arnold Arboretum, No. 7); P. H. Rolfs, *Subtropical Vegetable Gardening* (New York and London); A. E. Wilkin-

son, *Muck Crops* (New York); M. G. Kains, *Plant Propagation* (New York); B. S. Brown, *Modern Propagation of Tree Fruits* (New York); T. W. Sanders, *Popular Hardy Perennials* (London); Harriet L. Keeler, *Our Early Wild Flowers* (New York); L. B. Holland, *The Garden Blue Book* (Garden City, N. Y.); S. F. Hamblin, *Book of Garden Plans* (Garden City, N. Y.); E. E. Rexford, *The Making of a Home* (Philadelphia); H. Findlay, *House Plants, Their Care and Culture* (New York and London); Cochet-Cochet and S. Mottet, *Les Rosiers* (4. ed., rev., and enl., Paris).

**HOSPITALS.** Among the great number of donations to hospitals made during the year 1916 a few of the more important may be mentioned here. The Johns Hopkins Hospital, Baltimore, received \$93,000 from Kenneth Dows of New York, to be given as an annuity for five years for the purpose of supporting a research fund. The hospital also received by the will of Miss Jessie Gillender, a gift of \$150,000, part of which is to be used in research work for the cause, prevention, and cure of epilepsy. The Norwegian Lutheran Deaconess Home and Hospital, Chicago, received \$71,550 in subscriptions from the staff of the hospital and from J. P. Hevland, Mrs. Elvira Lindeman, and James A. Patten. The New York Medical College and Hospital for Women received \$5000 by the will of Col. Edward M. Knox, \$1000 from Dr. Marshall O. Terry, a bequest of \$10,000 by the will of W. W. Cole, a donation of \$2000 by Dr. Cornelia C. Brant, and three donations of \$1000 each by other persons. St. Luke's Hospital, Chicago, received from J. Ogden Armour, \$100,000; Mrs. H. H. Walker, \$50,000; Samuel Insull, \$25,000; Prof. Robert Rousilton, \$25,000, and the trustees of the hospital \$95,000, all of which sums were to be devoted to the erection of a new building. The Presbyterian Hospital of New York received \$30,000, by the will of Mrs. Eveline A. Meserole; the Presbyterian Hospital of Chicago, \$50,000 by the will of Thomas Templeton; the Charles T. Miller Hospital of St. Paul, \$1,500,000 by the will of Mrs. Martha A. Miller. The Sisters of Charity of St. Vincent de Paul were left over \$300,000, by the will of Mrs. Mary Halloran for the formation of a branch of St. Vincent's Hospital at Stanford, Dutchess County, N. Y., for the treatment of cancer victims. The Lakeside Hospital, Cleveland, received \$250,000; the Charity and St. Alexis's Hospitals each \$50,000; and the Babies' Dispensary and Hospital, Tuberculosis Free Dispensary, and Maternity Hospital, each \$25,000, by the will of Robert R. Rhodes, Cleveland. Ogdensburg (N. Y.) City Hospital received as an endowment a gift of \$130,000 by the will of A. Barton Hepburn. The Presbyterian Hospital of Chicago received \$150,000 by the will of James Longley of Boston; the Children's Memorial Hospital, Chicago, \$25,000 by the will of Bryan Lathrop. To Mt. Sinai Hospital, New York, was given \$150,000, for the endowment of a department of surgery of the stomach; St. Mary's Free Hospital for Children, New York, \$80,000, and St. Luke's Hospital, New York, \$25,000, by the will of Mrs. Mary Van Nest Jackson; the New York Eye and Ear Infirmary, \$10,000, by the will of Mrs. Serena Rhineland; New York Postgraduate Hospital and Montreal General Hospital, each \$50,000, by the will of John Torrence Venneck. Francis S. C. A. Ripley, left the Long Island College Hos-

pital \$20,000, and to the Brooklyn Hospital, \$12,000. It was announced that the Guggenheim brothers gave \$165,000 to Mt. Sinai Hospital of New York, for the erection of a private pavilion. The new building will be seven stories in height, and will have a frontage of 200 feet on Fifth Avenue overlooking Central Park. To the University of Pennsylvania Hospital was left a fund of more than \$3,000,000 for the treatment of cancerous, nervous, and disabling diseases. The fund constitutes her estate and its increment is willed for the purpose stated by Anna J. Jeanes, a noted Quaker philanthropist, who died in 1908. Episcopal Hospital, Philadelphia, received \$50,000, by the will of Marie S. Wilson. The New York Skin and Cancer Hospital received \$50,000, and the Hahnemann Hospital, \$25,000 by the will of Martha H. Andrews; the Presbyterian Hospital of New York, \$25,000, by the will of Mrs. Caroline A. Wilson. The will of the late John Fitzgibbons provides \$100,000, for the establishment of a city hospital at Marshall, Me. St. Luke's Hospital, New York, by the will of Mrs. Ellen Stebbins Curtis James, received \$100,000; Auburn (N. Y.) City Hospital, \$20,000, by the will of Caroline Willard; Pennsylvania Hospital, Philadelphia, Protestant Episcopal Hospital, Presbyterian Hospital, Polyclinic Hospital, and Samaritan Hospital, each \$10,000; Philadelphia Home for Incurables, Jewish Hospital Association, and Medico-Chirurgical Hospital, each \$5,000, by the will of Hall Engles. The bequests to the Pennsylvania and Presbyterian hospitals are to endow two free beds in each institution in memory of Mrs. Engles's mother, and two free beds in memory of the testator. Mt. Sinai Hospital, New York, \$150,000, for the endowment of its department of abdominal surgery received from Charles A. Wimpfheimer. Mrs. Sarah C. Hunsberger gave to the Allentown (Pa.) Hospital a donation of \$50,000. New York Postgraduate Hospital received a gift of \$100,000, from Mrs. Alfred G. Vanderbilt for an additional building to cover a 20-foot plot. It will be five stories in height and will be equipped as a babies' ward. Lowell (Mass.) General Hospital received a donation of \$200,000 from Frederick Fanning Ayer. On October 14th, the new Masonic Memorial Hospital of Elizabethtown was turned over to the Grand Lodge of the State of Pennsylvania. This hospital was contributed by the Philadelphia Masons, and the cornerstone of the institution was laid September 20th. The building is a three-story granite structure, and is arranged to accommodate 38 patients. The cost of the building was \$60,000. Two other buildings will be erected in the near future, at a total cost of \$200,000. The completion of the new \$300,000 addition to Mercy Hospital of Chicago was announced June 4th. The new building is four stories in height and is designed especially for the care of sick children. The new wing of the Methodist Episcopal Hospital of Indianapolis was opened October 12th. It is a five-story structure with a roof garden and devoted entirely to private patients. The City and County Hospital of Hobart, Oklahoma, was opened for the reception of patients on June 21st. The new home of the New York Orthopedic Dispensary and Hospital, on East Fifty-ninth Street, which cost nearly \$1,000,000, was formally opened on January 31st with an address by Col. Theodore Roosevelt, whose father was one of the

founders of the hospital 50 years ago. Dr. Russell A. Hibbs, in his address, stated that during 1915 the dispensary had treated 10,313 persons and that 630 had been treated in the hospital, and that although \$1,000,000 of the \$1,500,000 needed was forthcoming, three of their wards must remain vacant, with 150 patients waiting for beds.

Innumerable hospitals have been called into existence by the European war. In its earlier stages the war imposed a much greater strain on France than on England, the latter having comparatively few troops in the field, but there were during 1916 no fewer than 27 hospitals in France, established, administered, and supported by British voluntary effort. The following list has been given by the *Gaulois*: The Urgency Cases Hospital at Bar-le-Duc and the Arcen-Barrois Hospitals; the Hôpital Herbert Ward at Rolleboise; the Hôpital Lady Wemyss at Canly; the British Ambulance Committee at Gerardmer; the Hôpital Franco-Anglais (Lady Murray) at Treport; the Hôpital Fitzgerald at Passy; the Trianon Hospital at Versailles; the Hôpital de l'Alliance at Yvetot; the Hôpital Anglo-Ethiopien at Frevent; the Hôpital du Château de Bearn established at St. Cloud by Lady Hartwell; the Allhusen Hospital at Ceret; the Hôtel du Château d'Anuel near Compiègne; the Joint Anglo-French Hospital and Hôpital Civile de la Clayette; the Florence Fiennes Hospital at Malo-les-Bains; the Scottish Women's Hospital at Chanteloup; the Johnstone-Reckitt Hospital at Ris-Orangis; the Hôpital du Château de Rozières near Nanteuil-le-Haudouin; the Hôpital de Château de Blancat at Pau; the First Aid Nursing Yeomanry Hospital at Calais; the Lady Sykes Hospital at Canly; the Hôpital d'Hardelot near Boulogne, founded by the Duchess of Rutland; the Surgical Ambulance of Rosebruge (Mrs. Borden-Turner); the Hôpital Canadien No. 4 at St. Cloud; the Hôpital Anglais No. 307 at Neuilly-sur-Seine; the Hôpital Irlandais at Cezaincourt; and the Hôpital Anglais No. 6 at Nevers. The latest achievement of medical science for the succor of wounded soldiers is a motor field operating theatre, which is being presented to the Italian government by the Wounded Allies Relief Committee of this country. The vehicle, which is the first movable operating theatre to be constructed, has been designed by a well-known surgeon and prominent politician, Sir William Collins. The huge body is mounted on a four-ton chassis of 25 horse power. Its outstanding characteristics are completeness and compactness, with a view to use in any weather and in any climate. The entrance for the surgeon and his assistants is from behind the driver's seat, and leads immediately to a small compartment which is devoted solely to the sterilization of water, instruments, and complementary vessels, while storage is provided for dressings. **HOUSES.** See ARCHITECTURE.

**HOWARD UNIVERSITY.** A co-educational institution at Washington, D. C. It is nonsectarian and open to both men and women without regard to race, but is chiefly known for the education of negroes. In the fall of 1916 the faculty numbered 112 and the student body 1,396.

For the academic year 1915-16 the productive funds amounted to \$309,413 and the income for all current purposes to \$211,157. The library has about 31,400 volumes. President, Stephen M. Newman.

**HOWE, JULIA WARD.** See LITERATURE, ENGLISH AND AMERICAN, *History, etc.*, American.

**HOWELLS, WILLIAM DEAN.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction and Essays, etc.*, American.

**HOWISON, GEORGE HOLMES.** An American philosopher, died Dec. 31, 1916. He was born in Montgomery County, Md., in 1834, graduated at Marietta College in 1852 and at the Lane Theological Seminary in 1855. After holding positions at Washington and Harvard Universities, the Massachusetts Institute of Technology, and at the University of Michigan, he was Mills professor of philosophy at the University of California from 1884 to 1909, retiring in the latter year. In philosophy he accepted in the main the doctrines of Kant, but in developing them on original lines arrived at a personal idealism in which reality is a community of spirits sharing a common ideal eternally realized in God, the highest Spirit. He was one of the most successful philosophical teachers in the United States, his pupils being found in many colleges and universities. He organized the Philosophical Union of the University of California, a philosophical club before which addresses had been given which were subsequently enlarged and published as important treatises. William James first propounded his pragmatism before this Union. Professor Howison's publications include: *A Treatise on Analytic Geometry* (1869); *Limits of Evolution* (1901, 2nd ed., 1905); *Philosophy: Its Fundamental Conceptions and Its Methods* (in vol. i, Congress of Arts and Sciences, St. Louis Exposition, 1904), 1905. He also edited and contributed to Royce's *The Conception of God* (1897), and edited the publications of the Philosophical Union and the philosophical publications of the University of California. See PHILOSOPHY.

**HUERTA, VICTORIANO.** A Mexican soldier and dictator, died Jan. 13, 1916, at El Paso, Texas. A full-blooded Indian, and all his life proud of his race, he was born at Colotlán, State of Jalisco, Mexico, Dec. 23, 1854. As a boy of 17, he was taken by General Guerra to be his amanuensis, and later he attended the Chapultepec Military College. It is said that soon after Huerta's graduation, Porfirio Diaz, who had become President of Mexico, sent for him and offered him any post he wished. He chose that of chief of the geographical or topographical bureau. During a long period he made surveys of the country, gaining a remarkably intimate knowledge of its natural features. His success in this work brought him promotion to captain of engineers; later, after he had seen service as a soldier against the Yaqui and Maya Indians, he became brigadier-general. In 1911, when Diaz saw that his fall was inevitable, he sent for Huerta and was conducted safely by him to Vera Cruz.

To the new President, Francisco Madero, Huerta then gave his allegiance. He was placed

(1912) in charge of the campaign to put down Pascual Orozco, who had revolted. Temporarily the rebellion was quelled, and when it again gained headway Huerta won the decisive battle of Bachimba, returning to receive the praise of government and people and to accept the rank of general of division. In February, 1913, came the revolt of Felix Diaz. Madero had fled to Chapultepec, but he was brought back by Huerta, who was given entire charge of the loyal forces in Mexico City. For 10 days a battle raged in the streets. Some of the Maderistas charged that the defense was conducted in a half-spirited way and that Huerta had already agreed with Diaz to bring about the fall of his chief. Another version reads that Huerta could not tolerate the leniency shown Diaz. However that may be, a plot was formed and Madero and his brother Gustavo were seized.

Supported by the army, Huerta declared himself Provisional President of Mexico on Feb. 18, 1913. Within five days, as they were being conveyed from the palace to prison, the two Maderos and José María Pina-Suárez (former Vice-President) were murdered while under armed guard. Huerta never cleared himself, in the eyes of the world, of responsibility for this act, although he stated that he had tried to prevent the crime. The United States was sufficiently aroused to demand that President Taft intervene, but he was just about to leave office, and was unwilling to embarrass his successor. President Wilson refused to intervene, but he also refused to recognize Huerta as de facto President of Mexico. Great Britain and several other European powers had granted recognition.

Soon Huerta had his hands full with revolutions set going by Venustiano Carranza and Francisco Villa, and by Emiliano Zapata. The American ambassador, Henry Lane Wilson, who advised recognition, was recalled and in the following August (1913) John Lind, formerly Governor of Minnesota, was sent by President Wilson as his personal representative, to make certain demands of Huerta. The chief proposal was that the dictator would consent to a regular election for President in which he himself would not be a candidate. This Huerta flatly refused to do. When his high-handed actions were being investigated by the Congress, he arrested half of the deputies and dissolved the legislature, assuming dictatorial powers. An election was then held, but only Huerta's sympathizers were allowed to vote.

While United States warships were in Mexican waters to protect American interests threatened by the conflict of the various factions, part of the crew of the *Dolphin* were arrested in Tampico (April 9, 1914) and although they were quickly released when it was explained that they had come ashore for gasoline, Admiral Mayo thought fit to demand an apology and a salute to the flag of the United States. In this he was supported by the administration. Huerta failed to comply and finally refused to give the order to salute. On April 21st American marines and sailors landed at Vera Cruz, and after a sharp engagement in which eight Americans were killed and a number wounded, and 200 Mexicans lost their lives, they occupied and administered the city. Mediation offered by Argentina, Brazil, and Chile accomplished nothing definite at the "A. B. C." conference held at Niagara Falls. Within a few months, Huerta's hold on the pres-

idency had become so precarious that by July 15th he thought it wise to resign. Shortly thereafter he sailed for Spain.

March 3, 1915, marked the beginning of what was apparently an attempt on the part of the exiled dictator to regain his hold in Mexico. On that date he left Spain, supposedly for the West Indies; but after a short stop at Algeciras, Morocco, he started for New York, on a "pleasure trip," so he said. For some time he and his family lived in Forest Hills, L. I. His next move was a journey West, with the announced intention of visiting the Panama-Pacific Exposition. At Newman, N. Mex., on June 27th, a United States deputy marshal arrested him, charging that, using the United States as a base, he was conspiring to incite a revolution against a friendly country (that is, Mexico). Released on bond, he was again arrested at El Paso, Texas, July 3rd. At that time he appeared to be preparing to cross into Mexico. Various stories had been circulated about the support he had been able to secure, and it was asserted by Federal agents that this backing was German, chiefly represented by a certain Franz Rintelen, who was believed to have expended large sums to stir up trouble in Huerta's interest, and who eventually became a prisoner in the Tower of London. These charges were not proved, but for most of the time until his death Huerta was kept under guard at Fort Bliss. It was only when the disease of which he died (sclerosis of the liver) had made such progress that physicians ordered his removal, that he was taken to his home in El Paso. He was to have been tried Jan. 10, 1916.

A body of legend, or gossip, grew up about Victoriano Huerta. It seems certain that he was reckoned a hard drinker even in a country where hard drinking is common, and that his manner of life in general was such as to eventually ruin the iron constitution he possessed. But, as far as public appearance went, he was said to wear always the same cold, hard, calculating, inscrutable expression. His was a will that balked at nothing short of the end desired; until he was hemmed in on all sides he held his own with fierce tenacity, and even after he had been overcome he was ready to try it again.

**HUGHES, CHARLES EVANS.** See UNITED STATES, *Presidential Campaign*.

**HUGHES, MATTHEW S.** See METHODIST EPISCOPAL CHURCH.

**HUGHES, SIR SAM.** See CANADA.

**HUGHES, WILLIAM MORRIS.** An Australian statesman, who gained great prominence in 1916 through his speeches, made in Great Britain, on the subject of the Empire and its relation to the European war. He was born in Wales in 1864, and was educated at Llandudno Grammar School and at St. Stephen's Church of England School, Westminster, where he taught for a time. In 1885 he went to Australia, where within 30 years he had risen from humble employment to be Prime Minister. Mr. Hughes first gained public attention by his work in behalf of organized labor. It was on the Labor party's platform that, in 1894, after four terms in the Parliament of New South Wales, he was elected to the first Federal Parliament, as representative for a division of Sydney. After his admission to the bar, he had devoted himself to the organization of Maritime Unions, becoming general secretary of the Wharf Laborers, president of the Carters' Union of New South Wales, and president of the

Waterside Workers' Federation. In the government, he was chosen to the post of Minister of External Affairs in 1904, was Attorney-General after 1908, and became Prime Minister in 1914. While in Britain in 1916, Mr. Hughes made more than 100 speeches, direct, energetic, and popular in character, to urge united resistance by the Empire against Germany, not only by fighting, but by trade war. An enemy of the laissez-faire and free-trade theories, he demanded protection for British industry and for all labor. While he met opposition to his views, a considerable part of the press and the populace, besides all sorts of official and semi-official bodies, welcomed him with extraordinary enthusiasm. It was at the invitation of the government that he came to England to confer on war matters, but it was virtually a public demand that led to his appointment as British delegate to the commercial conference of the Entente Powers, held in Paris. A believer in compulsory military service, he made this a plank in the Australian Labor party's platform as early as 1901.

**HUNGARY.** A European kingdom, forming a part of the Austro-Hungarian monarchy. The Hungarian kingdom consists of "Hungary proper" and Croatia and Slavonia. Sometimes Transylvania, on account of its very large Rumanian population, is not regarded as a part of Hungary proper. See AUSTRIA-HUNGARY.

**HYDROAEROPLANE.** See AERONAUTICS.

**HYDRO-ELECTRIC POWER.** See ELECTRIC POWER, TRANSMISSION OF.

**HYDROPHOBIA.** See RABIES.

**HYGIENE.** The bubble fountain, which has largely replaced other forms of common drinking appliances, has been discovered to be not without possible dangers, especially if the flow of water is not forcible enough to keep all parts of the metal covered. An epidemic of streptococcus tonsillitis in one of the dormitories of a large university was traced finally to the bubble fountain used there. It was found that the water pressure was so low that it was almost impossible to drink from the bubble without bringing the lips into contact with the metal. The fountains were found on examination to be heavily contaminated with streptococci. The city water was pure, but the contagious organisms were obtained from the surface of the fountain, from the inside of it, and from the water discharged through it. Later laboratory investigations demonstrated that streptococci were being discharged in over half the fountains, the contents varying in amount from a few bacteria to an almost pure culture, the latter being obtained by swabbings from the surface of the fountain. It appears that bacteria may remain in the water from 2 to 135 minutes, depending partly on the height of the bubble. The explanation is that while most of the organisms are swept away, many remain dancing in the column of water just as a ball dances on the garden fountain. To remedy this difficulty, it was found necessary only to slant the tube at an angle of 50 degrees from the vertical.

**ICELAND.** A Danish crown colony, with an area of about 40,456 square miles, of which 16,245 square miles are inhabited; population (1911), 85,183. The responsible executive resides at Reykjavik. The trade in 1912 amounted to 15,347,000 kroner imports, and 16,568,000 kroner exports, the latter consisting of wool, dried fish, mutton, ponies, and sheep. A Brit-

ish source gives imports from Denmark for 1914 at £301,333; exports to Denmark, £555,944. The legislature (Althing) has 40 members, 34 elective by universal suffrage. The franchise is exercised by men and women over 25 years of age. The year 1916 has been full of disturbing influences for the Icelanders. Owing to the war, business has been entirely deranged and largely suspended, as shipments to and from Europe were made with extreme difficulty and danger. In this extremity attempts were made to trade direct with America. Three commissioners brought direct to the United States a cargo of wool and herring,—possibly the first shipment thus made,—and obtained a return cargo for Icelandic needs. This was followed by two private ships, of the Iceland Navigation Co. However, fisheries flourished, and prices rose. Much progress was made in the development of coal veins, which improved steadily in quality. In eastern Iceland a *spath* or iceland-spar mine was worked under French auspices. The introduction of automobiles suited to pony-trails promises a revolution in local travel and transportation.

**IDAHO. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 436,881. The population in 1910 was 325,594.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16, were as follows:

	Acreage	Prod. Bu.	Value
Corn .....	1916 21,000	735,000	\$735,000
	1915 22,000	770,000	500,000
Wheat .....	1916 634,000	15,071,000	22,004,000
	1915 670,000	18,730,000	14,984,000
Oats .....	1916 310,000	18,330,000	7,198,000
	1915 385,000	15,745,000	5,353,000
Potatoes .....	1916 27,000	4,050,000	5,144,000
	1915 28,000	3,500,000	1,960,000
Hay .....	1916 725,000	1,812,000	21,925,000
	1915 677,000	1,828,000	14,076,000
Rye .....	1916 2,000	34,000	32,000
	1915 3,000	60,000	41,000
Barley .....	1916 190,000	7,410,000	6,076,000
	1915 191,000	7,736,000	4,023,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments....	725	698
Average number of wage earners	8,220	8,919
Capital invested .....	\$32,477,000	\$44,961,000
Wages .....	5,498,000	7,491,000
The value of materials used...	9,920,000	14,892,000
The value of products.....	22,400,000	28,454,000

**MINERAL PRODUCTION.** The output of gold, silver, copper, lead, and zinc in the State in 1915 was \$33,328,930, an increase of over 50 per cent compared with the production in 1914. The gold production remained nearly the same. Silver increased about 4 per cent in quantity, copper increased from 6,445,187 pounds in 1914 to 6,978,713 pounds in 1915. The great increase in the total value of the metal output amounted to more than \$13,000,000, which was due largely to the increased price of lead and zinc. The production of lead was 345,999,466 pounds, an

increase of 8 per cent. The production of zinc was 70,152,234 pounds, valued at \$8,699,001.

The value of the mined output of gold, silver, copper, lead, and zinc in the State in 1916, according to the estimates of the United States Geological Survey, was over \$47,000,000, an increase of 41 per cent from \$33,328,930 in 1915. There was a record output of silver, lead, and zinc, and increased production of copper, and a slight decrease in gold. The mined production of gold decreased from \$1,179,731 in 1915 to \$1,098,000 in 1916, a decrease of 7 per cent. Part of the decrease was due to the smaller placer output in dredging. The mined output of silver increased from 11,769,128 ounces in 1915 to approximately 12,500,000 ounces in 1916. As the price of silver was much above that of 1915 the value of the output increased from \$5,966,948 to \$8,225,000, or 38 per cent. The production of copper increased from 6,978,713 pounds in 1915 to over 8,000,000 pounds in 1916. The increase in value was from \$1,231,275 to \$2,184,000, or 79 per cent. The mined output of lead increased from 345,999,466 pounds in 1915 to 362,000,000 pounds in 1916. The value increased from \$16,261,975 to \$24,616,000, or about 51 per cent. The mined production of zinc increased from 70,152,234 pounds in 1915 to approximately 80,000,000 pounds in 1916, while the value increased from \$8,699,001 to about \$10,060,000, or 25 per cent.

**EDUCATION.** Statistics for 1915 are the latest available. In that year there were 120,000 pupils in the public schools. The enrollment was 92,437. There were 2943 teachers, of whom 2276 were women, and 667 men. The average salary of women teachers was \$72.55 per month, and of men \$95.25. The total expenditure for educational purposes is about \$4,500,000 annually.

**FINANCE.** The total receipts for the fiscal year 1915 were \$3,054,903, and the disbursements, \$3,172,250. At the beginning of the year there was a balance of \$246,350, and at the end, of \$1,132,047. The bonded debt of the State in that year amounted to \$2,237,750.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include a Soldiers' Home at Boise, State Penitentiary at Boise, Insane Asylums at Black Foot and Orofino, and a State Sanitarium at Nampa.

**POLITICS AND GOVERNMENT.** There was little of unusual interest in the political history of the State during the year. The Legislature did not meet. Aside from the voting for President the only elections in the State were for State officers, and two Congressmen-at-large. The Democrats elected the State ticket by a plurality of only 572 votes. Alexander, the Democratic candidate, received 63,877; Davis, Republican, 63,305. The Socialist candidate, Triplow, received 7321 votes. For President, Wilson received 70,021 votes, Hughes, 56,368. In 1912 Wilson received 33,921 votes, Taft, 32,810, Roosevelt, 25,527. The Republicans elected the two representatives in Congress by a considerable majority. All the State officers except the treasurer and State superintendent of instruction are Democratic.

During the year work was begun on a new irrigation system and parallel electric railroad leading from Boise into hitherto undeveloped territory known as the Bruneau country. This system, which is under the Carey Act, will re-

claim about 75,000 acres of land. One of the provisions of the contract is that no land is to be sold by the promoting company until water is running in the canals. The railroad, which will connect this territory with Boise, will pass through the Grand View project also, and will connect with the Oregon Short Line Railroad at Orchard.

**STATE OFFICERS.** The State officers for 1917 were as follows: Governor, Moses Alexander; Lieutenant-Governor, Ernest L. Parker; Secretary of State, William T. Dougherty; State Treasurer, John W. Eagleston; State Auditor, Clarence Van Dusen; Attorney-General, T. A. Walters; Superintendent of Public Instruction, Ethel E. Redfield; Inspector of Mines, Robert Bell.

**JUDICIARY.** Supreme Court: Chief Justice, William M. Morgan; Associate Justices, Alfred Budge and John C. Rice; Clerk, I. W. Hart.

**STATE LEGISLATURE:**

	Senate	House	Joint Ballot
Democrats .....	21	36	57
Republicans .....	16	29	45
Democratic majority ..	5	7	12

**IDAHO, UNIVERSITY OF.** A State co-educational institution at Moscow, Idaho, founded in 1889. In the fall of 1916 there were 91 regular instructors and 23 extension workers. The student enrollment was 909. Prof. A. P. R. Drucker was appointed head of a new department of commerce. Separate departments were established for plant physiology and entomology. During the year correspondence courses were begun on a large scale. The finances of the institution are on a biennial basis which in 1916-17 provided productive funds amounting to \$666,346 and an income of \$264,803. The library contains 40,000 volumes. The president of the University of Idaho is Melvin A. Brannon.

**ILLINGWORTH, ALBERT.** See GREAT BRITAIN, *Government.*

**ILLINOIS. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 6,193,826. The population in 1910 was 5,638,591.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16, were as follows:

	Acreage	Prod. Bu.	Value
Corn .....1916	10,400,000	806,800,000	\$257,712,000
1915	10,400,000	874,400,000	202,176,000
Wheat .....1916	1,475,000	16,225,000	26,771,000
1915	2,800,000	53,200,000	53,200,000
Oats .....1916	4,470,000	172,095,000	87,768,000
1915	4,343,000	195,435,000	68,402,000
Potatoes ..1916	125,000	7,250,000	12,978,000
1915	126,000	13,860,000	8,177,000
Hay .....1916	3,100,000	4,495,000	50,794,000
1915	2,500,000	a 3,850,000	41,580,000
Tobacco ...1916	700	525,000	52,000
1915	700	b 595,000	54,000
Rye .....1916	43,000	666,000	813,000
1915	49,000	906,000	752,000
Barley ....1916	60,000	1,920,000	1,978,000
1915	54,000	1,836,000	1,047,000

a Tons. b Pounds.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States

are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments	18,026	18,888
Average number of wage earners .....	465,764	506,948
Capital invested .....	\$1,548,171,000	\$1,943,836,000
Wages .....	273,319,000	340,910,000
The value of materials used .....	1,160,927,000	1,340,184,000
The value of products ..	1,919,277,000	2,247,323,000

**MINERAL PRODUCTION.** The petroleum marketed in 1915 from the oil fields of the State was 19,041,695 barrels, which was about 13 per cent less than the corresponding output of 1914. The average price received for this oil was 80 cents a barrel. The total amount of the value was \$18,655,850, a decrease of \$6,770,329, compared with 1914. As a consequence of this decline in output Illinois fell to fourth place in the rank of oil producing States, third place being taken in 1915 by Texas. During the year a total of 757 wells were completed, compared with 1579 in 1914.

There were mined during the year 1915, silver, lead, and zinc valued at \$1,464,067, compared with a value of \$547,816 in 1914. There were mined 1320 short tons of lead concentrates, and 20,454 short tons of zinc concentrates. The silver produced in 1915 amounted to 3864 fine ounces.

The coal production of the State in 1916 is estimated at 64,500,000 tons, an increase of more than 5,600,000, or nearly 10 per cent over the production of 1915. That the output was not even greater than this is attributed to a lack of cars, and in some localities to a scarcity of labor. The production was above the normal during the first three months of the year, but fell until the middle of August, when it continued to increase. The most notable feature of the year was the extension of the markets for Illinois coal, but this is probably only temporary.

**TRANSPORTATION.** The total railway mileage in the State on June 30, 1915, was 12,392. The roads having the longest mileage were the Illinois Central, 2024; the Cleveland, Cincinnati, Chicago, and St. Louis, 650; the Wabash, 669; the Gan Dalia Railroad, 303; and the Elgin, Joliet, and Eastern, 327.

**EDUCATION.** The latest figures available for education in the State are those for 1914. In that year the total school population was 1,650,258. The total enrollment in the schools was 1,043,227. The total number of teachers employed was 31,805, of whom 26,035 were women, and 5770 men. The amount paid to teachers was \$21,781,221, and the average yearly salary of teachers was \$684.83. The total school expenses for the year were \$40,287,756. The value of school property was \$119,568,943. There was appropriated by the State for educational purposes \$3,000,000, and there was raised by district taxation \$32,962,153.

**FINANCE.** The total receipts from all sources for the biennial period Oct. 1, 1914, to Sept. 30, 1916, amounted to \$52,740,171. The disbursements were \$44,944,340. There was a balance on Oct. 1, 1914, of \$12,255,132, and on Oct. 1, 1916, of \$7,795,830.

**CHARITIES AND CORRECTIONS.** The State charitable and correctional institutions are as fol-

lows: The Elgin State Hospital at Elgin, the Kankakee State Hospital at Kankakee, the Jacksonville State Hospital at Jacksonville, the Anna State Hospital at Anna, the Watertown State Hospital at Watertown, the Peoria State Hospital at Peoria, the Chester State Hospital at Chester, Chicago State Hospital, the Lincoln State School and Colony at Lincoln, Dixon State School and Colony at Dixon, the Illinois School for the Deaf at Jacksonville, the Illinois School for the Blind at Jacksonville, the Illinois Industrial Home for the Blind at Chicago, the Illinois Soldiers' and Sailors' Home at Quincy, the Soldiers' Widows' Home of Illinois at Wilmington, the Illinois Soldiers' Orphans' Home at Normal, the Illinois Charitable Eye and Ear Infirmary at Chicago, the State Training School for Girls at Geneva, the St. Charles School for Boys, and the Alton State Hospital at Alton.

The total population of these institutions in November, 1916, was 22,821. They are administered by the State Charities Commission. The total appropriation for the care of these institutions covering the years 1916-17 was \$10,736,282. In addition the Legislature appropriated certain sums for new institutions in new buildings. Among these was the appropriation for the erection of a new State colony for epileptics, and an appropriation for the continuation of the erection of the Alton State Hospital. During 1915-16 the mechanical restraint of patients in the State hospitals was entirely abolished, and corporal punishment in institutions housing children was absolutely prohibited. Employees of all these institutions were placed on an eight hour day with one day's rest in seven, and an automatic wage increase scale was formulated.

**POLITICS AND GOVERNMENT.** The Republican organization of Illinois passed under new control in 1916. The presidential primaries of April 11th involved struggles for dominance between the factions. Senator L. Y. Sherman, a "favorite son" entry, was the only Republican candidate who filed for the preferential ballot. He received 155,945 votes. Roosevelt's name was written in by 15,348; Hughes's was written in by 1078. In the Democratic primaries, President Wilson received 136,839 votes.

The Illinois law provides for the direct election of national delegates and in addition party committeemen were elected at the April primaries. Senator Sherman had a "favorite son" slate of delegates. It was smashed by Charles H. Sergel and John Siman, former Progressives who were out for Roosevelt, and by Andrew Russel. John M. Harlan ran for delegate-at-large, using Roosevelt as his platform and preparedness as his argument. He failed of election by 23,000 votes, although he got 113,716 votes. William B. McKinley, Taft manager in 1912, ran highest for delegate-at-large (eight elected, with 148,595 votes, and Medill McCormick, a Roosevelt manager in 1912, ran second with 147,641. Thus, with three exceptions, the Illinois delegation to the national convention was pledged to Sherman.

On the Democratic side, the Roger C. Sullivan forces controlled the Illinois delegation to the St. Louis convention. Robert M. Sweitzer, defeated candidate for mayor of Chicago in 1915, ran as high man with 118,919 votes; Governor Dunne second with 112,536. Carter H. Harri-

son, former mayor of Chicago, was among the winning eight for delegate-at-large, and for the first time in many years had a seat in a Democratic national convention, not in the gallery. Robert E. Burke, who cast the only vote against Wilson at St. Louis, was among the delegates-at-large.

In the fight over ward committeemen in Chicago, the notable feature was the defeat of Charles S. Deneen, former Governor, Republican, who was ousted by the forces of Mayor William Hale Thompson from a ward committee-ship he had held for 22 years.

When the Republican convention met at Peoria April 21st a new alliance was formed. The Thompson, Sherman, and Lowden groups combined and elected Fred E. Sterling as State chairman. It overthrew the Deneen camp, which had dominated the State organization since 1904, and it was the greatest shake-up in the Republican machine in 12 years. Behind the combination was a political deal involving the national committee-ship and likewise a tentative understanding on a State slate for the September primaries. Mayor Thompson was the candidate of the new alliance for national committeeman. Roy O. West, the old committeeman, was the choice of the Deneen forces. At the national convention, Thompson won, getting 38 votes to West's 17. After much skirmishing the Cook County committee was reorganized. Here, too, the Deneen forces lost control. Homer K. Galpin was elected county chairman through a combination of city hall men and "neutrals." Thus, through the April 11th primaries the Deneen group lost county and State control and likewise the national committee-ship.

On the Democratic end the Sullivan forces increased their margin of control over both the State and county machinery.

**State Primaries.** Three Republicans ran for Governor. Col. Frank O. Lowden had the support of the Sherman and Thompson camps in addition to his personal following. Col. Frank L. Smith of Dwight made a remarkable race without the backing of any of the factional organizations. The Deneen camp brought out Morton D. Hull, a State senator. At the primaries September 13th, Colonel Lowden won by a majority vote. Back of the fight over the State offices was a bitter struggle over the Cook County offices, and here the Deneen group managed to get a few places, important in a patronage way—the recorder of deeds and member of the board of review. On these two offices and the jobs they command, the Deneen camp is basing a struggle to come back.

On the Democratic end Governor Dunne was up for re-nomination. He had stirred the wrath of the Sullivan men by refusing to enter the caucus of the Illinois delegates at St. Louis where Sullivan was given a bouquet endorsement for Vice-President. The Sullivan group, however, brought out no candidate until a few days before the primaries, when the Harrison-Dunne forces put forth a circular attacking some of the Sullivan leaders. At once the Cook County committee met and indorsed William B. Brinton of Dixon, a plow maker, against Dunne. The Governor, however, won by a large margin at the polls.

**The Fall Campaign.** The Republican campaign was started off with a State convention

at Peoria at which Hughes was the central figure. The State platform declared for a long list of reforms, among them: adoption of the tax amendment to the constitution; revision of the revenue laws; consolidation of State boards and departments to prevent overlapping and waste; a budget; a corrupt practice act; revision of elections to curtail frequency and expense; a constitutional convention; home rule for Chicago on public utilities; shorter hours for women workers; State supervision of private banks; full suffrage for women and extension of civil service. It emphasized "Democratic extravagance."

The Democrats a week later adopted a State platform charging the corporate interests with trying to get possession of the State government at Springfield. It called for a corrupt practices act; a living wage for Pullman porters (Colonel Lowden was a director of the Pullman company); an eight-hour day for all workers outside agricultural pursuits; short ballot; initiative and referendum; private bank supervision; home rule for Chicago; constitutional convention; a budget and revenue revision and other questions which were outside the range of partisan issues. As a bid for the feminine vote of Illinois, the Democrats named Mrs. Catherine Waugh McCulloch of Evanston, a woman suffrage leader, for one of the presidential electors-at-large.

Up to within two weeks of election day, November 7th, Illinois was debatable territory on President. The election of the Republican State ticket was a foregone conclusion, but Wilson was displaying great strength. The attitude of the women voters, who for the first time had the ballot on presidential electors, was the main problem. Republican workers in all quarters reported Hughes and Fairbanks to be lagging. The State candidates, off on a special train tour of the State, subordinated their own candidacies and whooped it up for Hughes and laid all stress on the national aspects of the election. At length, some two weeks before election day, State headquarters, which had been gloomy, detected a strong swing towards Hughes. Roosevelt made a speech at the Chicago stockyards which was a call to the former Progressives. It had wide effect, Chicago and Illinois being a main stamping ground of the Moose in 1912. The presence of former Progressives on the tickets, chief among them Medill McCormick, also brought the two wings together. Especial attention was paid to organizing the women, and when the vote was counted, Illinois, normally Republican by between 150,000 and 200,000 votes, led all the States in the size of its Republican vote and its Republican plurality.

The vote stood: For President, Wilson, 950,229; Hughes, 152,549; Benson, 61,294; Hanly, 26,047; Reimer, 2488. For Governor, Lowden, Republican, 696,535; Dunne, Democrat, 556,654; Steadman, Socialist, 52,316; Golden, Prohibition, 15,309; Frances, Socialist Labor, 1739.

The vote of men and women for President was divided as follows: for Wilson 556,937 men, 383,292 women; for Hughes 693,334 men, 459,215 women. In 1908 Taft had a plurality of 179,000, and Roosevelt in 1904 had a plurality of 305,000. In these elections the women had no vote. The Illinois delegation in Congress stands

21 Republicans and 6 Democrats, as compared with 17 Republicans and 10 Democrats in the previous Congress.

**OTHER EVENTS.** By a decision of the State Supreme Court handed down on February 16th, the women of the State were denied the right to vote for delegates and alternates in national nominating conventions and State central and precinct committeemen. The decision held that while the Legislature had the right to give women this kind of suffrage it had not done so, and it was not within the province of the court to write the privilege into the law.

Plans for the new passenger terminal of the Illinois Central Railroad in Chicago were completed during the year. These called for a steel and granite structure 700 by 400 feet, with a front of columns of great size and beauty, and with train sheds 1400 feet long. The total expenditure for the station may reach \$20,000,000.

On October 23rd, Charles C. Healey, chief of police of Chicago, was indicted on two charges, the first indictment accused him of malfeasance in office, and the second named him with two others as conspirators in a plot to nullify the anti-gambling law.

**STATE OFFICERS.** Governor, Frank O. Lowden; Lieutenant-Governor, John G. Oglesby; Secretary of State, Louis L. Emmerson; Treasurer, Len. Small; Auditor, Andrew Russel; Adjutant-General, Frank S. Dickson; Attorney-General, Edward J. Brundage; Superintendent of Education, Francis G. Blair; Secretary of Agriculture, B. M. Davison; Superintendent of Insurance, Rufus M. Potts—all Republicans except Potts, Democrat.

**JUDICIARY.** Supreme Court: Chief Justice, Charles C. Craig; Associate Justices, James H. Cartwright, William M. Farmer, Orrin N. Carter, Frank H. Dunn, George A. Cook, Warren W. Duncan; Clerk, Charles W. Vail.

**ILLINOIS UNIVERSITY OF.** A co-educational non-sectarian institution at Urbana, Ill. It was founded in 1867. On Nov. 1, 1916, the total enrollment in all departments of the university was 5876 and the faculty numbered 840. The following important additions to the faculty were made: Henry Winthrop Ballantine (from the University of Wisconsin), professor of law and dean of the College of Law; Ernest Bernbaum (from Harvard), professor of English; Eliot Blackwelder (from the University of Wisconsin), professor of geology; Fanny C. Gates (from Grinnell College), dean of women; Barry Gilbert (from the University of California), professor of law; Cullen Warner Parmelee (from Rutgers College), professor of ceramic engineering; Richard Chace Tolman (from the University of California), professor of chemistry. For the year ending June 30, 1916, the University of Illinois received a total income of \$3,051,875, of which \$2,453,370 was received from State appropriations and \$148,732 from the Federal government. The library contained, on October 1st, 374,167

volumes and 92,430 pamphlets. President, Edmund Janes James. See the article HORTICULTURE.

**ILLUMINATION.** See ELECTRIC LIGHTING.  
**IMMIGRATION AND EMIGRATION.**  
 In the matter of immigration the year 1916 duplicates to a very great extent the year 1915. The number of aliens entering the United States varied only in a slight degree. During the fiscal year 298,826 aliens entered the country, compared with 326,700 in 1915. How immigra-

The increase in the percentage of rejection is due to two circumstances: first, a poorer class of immigrants, second, the opportunity afforded at some of the seaports for a more thorough examination than was possible when a larger number of applicants had to be inspected within a given time.

The following table shows the number of immigrant aliens admitted during the fiscal year, by countries of the last permanent residence and races of people.

## IMMIGRATION AND EMIGRATION

Net Increase or Decrease of Population by Arrival and Departure of Aliens, Fiscal Year Ended June 30, 1916, by Races or Peoples.

Race or people	Admitted.			Departed.			Increase (+) or decrease (-)
	Immigrant aliens	Nonimmigrant aliens	Total	Emigrant aliens	Nonimmigrant aliens	Total

\* Departed via Canadian border. Reported by Canadian Government as Canadians.

tion has been affected by the war in Europe may be noted from the fact that during the fiscal year 1914 aliens to the number of 1,218,480 migrated to the United States. In addition to the number of immigrant aliens entering in 1916 67,922 non-immigrant aliens entered, so that the total admissions were 366,748. Against this 129,765 emigrants and 111,042 non-emigrant aliens, a total of 240,807 left the United States. The actual increase in population through immigration was 125,941. The increase in 1915 was 50,070, while in 1914 it was 769,276. In 1914 aliens to the number of 3041 were rejected, a percentage of 2.3 of the number who applied. The corresponding figures of percentage in 1915 were 21.111 and 5.3 per cent, and for 1916, 18,867 and 4.9 per cent.

The Burnett Immigration Bill with the literacy test passed the House of Representatives in April by a vote of 308 to 87. The literacy test excludes all aliens over 16 years of age, physically capable of reading, who cannot read the English language, or any other language, including Hebrew or Yiddish, providing that any admissible alien or any alien heretofore or hereafter admitted or any citizen of the United States may bring in or send for his father, or grandfather, over 55 years of age, wife, mother, grandmother, or his unmarried or widowed daughter, if otherwise admissible whether such relatives can read or write, and such relatives will be permitted to enter. In the classification already excluded, the bill added stowaways, vagrants, sufferers from tu-

berculosis, those who advocate the lawful destruction of life, Hindus and "persons of constitutional psychopathic inferiority." The head tax was increased from \$4 to \$8, and the penalties imposed on steamship companies for bringing defectives were made heavier than heretofore. No action was taken on the bill by the Senate in 1916.

**INCINERATORS.** See GARBAGE AND REFUSE DISPOSAL.

**INCOME TAX.** See TAXATION.

**INDIA, BRITISH.** British India is that part of East India administered by the British sovereign (as Emperor of India) through the Governor-General of India in council. India, as defined by the British Parliament, includes British India and the native states that are under the suzerainty of the British government. The capital of British India was formerly Calcutta, but since 1912 has been Delhi.

**AREA AND POPULATION.** The combined area of British India and the native states under British suzerainty, as covered by the census of 1911, is stated at 1,802,657 square miles and the number of inhabitants at 315,156,396. British territory is divided into 15 provincial governments, which have a total area of 1,093,074 square miles; the native states have an aggregate area of 709,583 square miles. Inter-provincial transfers of territory, and transfers from native to British territory, and vice versa, occasionally take place, so that censuses as originally reported are subject to adjustment. Nearly a year after the last census, that is, on April 1, 1912, the Province of Eastern Bengal and Assam and the Province of Bengal were reconstituted and erected into three provinces. These provinces are Bengal (which received the style "presidency"), Bihar and Orissa, and Assam. On Oct. 1, 1912, another new province was erected out of the division of Delhi in the Punjab. The table below shows the area of British India by provinces and of the native states, together with the population as returned by or adjusted from the census of March 10, 1911; the table also shows the percentage of increase (+) or decrease (-) in the number of inhabitants from 1901 to 1911 and from 1981 to 1901.

\* Included in Bihar and Orissa Province. † Included in Bombay Presidency. ‡ Included in Central Provinces and Berar. § The area of Delhi Province has been provisionally stated at 557 square miles, and its 1911 population at 391,828. ¶ Included in the United Provinces.

In 1911, males and females in British India and the native states numbered 161,338,935 and 153,817,461 respectively; in British India alone, 124,873,691 and 119,393,851. The urban population was returned at 29,748,228 and the rural at 285,408,168.

The number of languages spoken in India, as shown by the 1911 census, is 264. The languages of greatest prevalence are as follows: Hindi, the vernacular of 82,003,235 persons in 1911; Bengali, 48,367,915; Telugu, 23,542,861; Marathi, 19,806,636; Tamil, 18,128,365; Rajasthan, 14,067,590; Western Hindi, 14,037,832; Gujarathi, 10,682,248; Kanarese, 10,525,739; Oriya, 10,162,321; Burmese, 7,803,504; Malayalam, 6,792,277. Further details of the population by language are given in the 1915 YEAR BOOK.

The population of the larger cities (including cantonments) in 1911 and the increase (+) or decrease (-) per cent since 1901 are as follows: Calcutta, with suburbs, 1,043,307 (+ 9.9); Bombay, 979,445 (+ 26.2); Madras, 518,660 (+ 1.8); Hyderabad, 500,623 (+ 11.6); Rangoon, 293,316 (+ 19.5); Lucknow, 259,798 (- 1.6); Delhi, 232,837 (+ 11.6); Lahore, 228,687 (+ 12.7); Ahmedabad, 216,777 (+ 16.6); Benares, 203,804 (- 4.4); Agra, 185,449 (- 1.4); Howrah, 179,006 (+ 13.6); Cawnpore, 178,557 (- 12.0); Allahabad, 171,697 (- 0.2); Poona, 158,856 (+ 3.6); Amritsar, 152,756 (- 6.0); Karachi, 151,903 (+ 30.2); Mandalay, 138,299 (- 24.8); Jaipur, 137,098 (- 14.4); Patna, 136,153 (+ 1.0); Madura,

Jews .....	18,524	2,456	20,980
Animists .....	7,348,024	2,947,144	10,295,168
Other and un-specified .....	2,840	84,761	37,101
<b>Total</b> .....	<b>244,267,542</b>	<b>69,280,298</b>	<b>313,547,840</b>

\* Religion was not recorded in the case of 1,608,556 persons in the North-West Frontier Province.

The proportion of Hindus per 10,000 inhabitants was 7034 in 1901 and 6931 in 1911; Mohammedans, 2122 and 2126; Buddhists, 322 and 342; Animists, 292 and 328; Christians, 99 and 124.

The chief castes, with their numerical strength in 1911, include the following: Sheikh, 32,131,342; Brahman, 14,598,708; Chamar, 11,493,733; Ahin, 9,508,486; Rajput, 9,430,095; Burmese, 7,644,310; Jat, 6,964,286; Maratha, 5,087,436; Kunbi, 4,512,737; Teli and Tili, 4,233,250; Pathan, 3,796,816; Kurmi, 3,735,651; Kumhar, 3,424,815; Kapu, 3,361,621; Mahar, 3,342,680; Koli, 3,171,978; Hajjam, 3,013,399; Lingayat, 2,976,293; Gond, 2,917,950; Jolaha, 2,858,399; Palli, 2,828,792.

**EDUCATION.** The 1911 census failed to record literacy in the case of 1,741,007 persons. Of the remainder, 313,415,389 persons (160,418,470 male, 152,996,919 female), literates numbered 18,539,578 (16,938,815 male, 1,600,763 female). Persons literate in English numbered 1,670,387 (1,518,361 male, 152,026 female).

In 1914, the number of educational institutions in India (exclusive of British Baluchistan) was 185,584, with 7,531,515 scholars. These institutions are classified in the table below:

	<i>Institutions for</i>		<i>Scholars</i>	
	<i>Males</i>	<i>Females</i>	<i>Males</i>	<i>Females</i>
University ..	183	14	46,867	470
General				
Primary ..	116,718	14,731	4,612,386	909,657
Secondary ..	6,303	573	996,013	79,711
Special .....	6,261	947	175,572	30,490
Private .....	37,754	2,105	596,888	83,461
<b>Total</b> ..	<b>167,214</b>	<b>18,370</b>	<b>6,427,726</b>	<b>1,108,789</b>

Notwithstanding the prevalence of illiteracy, education has made considerable progress in recent years, and much attention has been given by the Department of Education to primary, commercial, and technical instruction.

**AGRICULTURE.** The reported total area cropped in British territory in 1913-14 was 246,989,228 acres; the net area (that is, the total area less areas cropped more than once) was 219,191,773 acres, as compared with 224,165,602 acres in 1912-13. The area under food grains in 1913-14 was 191,573,393 acres, of which 76,907,895 acres were under rice, 22,685,024 wheat, 21,405,397

jawar, and 15,385,537 bajra; oilseeds, 14,658,027 acres; cotton, 15,844,363; jute, 3,137,165; other fibres, 913,803; sugar, 2,707,373; tobacco, 1,001,708; tea, 572,108. Some of the more important estimated yields in the year 1913-14 (including crops in certain of the native states) are: rice (cleaned), 28,167,000 tons; wheat, 8,427,000 tons; tea (calendar year), 307,249,600 pounds; cotton, 5,797,000 bales (of 400 pounds); jute, 8,893,900 bales (of 400 pounds); linseed, 382,200 tons; rape and mustard, 1,042,900 tons; sesamum (til), 407,900 tons; groundnuts, 731,900 tons; raw sugar, 2,262,600 tons; indigo, 26,800 hundredweight.

Area in hectares and yield in thousands of metric quintals, with yield per hectare in 1915, are reported as follows (the figures for 1916 are subject to revision):

	<i>Hectares</i>		<i>1000 Qs.</i>		<i>Qs. ha.</i>
	<i>1915</i>	<i>1916</i>	<i>1915</i>	<i>1916</i>	
Wheat ..	13,141,988	12,198,269	102,529	86,547	7.8
Rice .....	31,076,187	.....	334,046	.....	10.7
Cotton ..	7,270,886	.....	6,929	.....	1.0
Linseed ..	1,345,561	1,342,824	4,034	4,816	6.4
Kape and mustard ..	2,633,253	2,579,026	12,386	11,004	4.7

**COMMERCE.** Import and export values for the year ended March 31, 1914, reached the highest mark in the history of British India. The decrease in the foreign trade in the fiscal year 1915 was largely due to the disorganization of the steamship services between British India and other countries as a result of the great war. Imports of private merchandise and exports of private Indian merchandise combined were valued at £210,275,961, as compared with £284,966,287 in 1914; the decrease in 1915 was 26.2 per cent, the decrease in imports being 24.7 per cent and in exports 27.3 per cent. Of the imports, 74.1 per cent came from countries of the British Empire, which received 47.3 per cent of the exports; the corresponding figures in 1914 were about 70 and 37 per cent. For years ended March 31st, the following table shows sea-borne imports and exports, in thousands of pounds sterling:

	<i>1904-05</i>	<i>1909-10</i>	<i>1913-14</i>	<i>1914-15</i>

In the fiscal years 1914 and 1915, some of the principal imports for home consumption were valued as follows, in thousands of pounds sterling: cotton manufactures, 44,199 and 32,666 (including yarn, 2776 and 2568); sugar, 9971 and 7022; railway material, 6690 and 6722; iron and steel, 10,663 and 6513; machinery, etc., 5172 and 4027; mineral oil, 2744 and 2938; copper, 2745 and 1849; hardware, etc., 2632 and 1707; provisions, 1649 and 1405. Leading exports of Indian produce in 1914 and 1915, in thousands of pounds sterling: raw cotton, 27,362 and 22,304; jute manufactures, 18,849 and 17,213; rice, 17,756 and 11,439; tea, 9983 and 10,347; seeds, 17,116 and 9769; raw jute, 20,551 and 8607; wheat and flour, 9590 and 6159; cotton manufactures (including yarn), 8080 and 5340; hides and skins, 7815 and 5207; leather, 2833 and 3173; millet, barley, pulse, etc., 2767 and 1768; wool, 1670 and 1570; opium, 2280 and 1176.

By principal countries, imports of merchandise and exports of Indian merchandise are shown below:

In addition to the sea-borne trade, which alone has been considered in the foregoing paragraphs, there is a land foreign trade of considerable magnitude. Imports and exports by land in 1913-14 were valued at £8,014,000 and £6,282,000 respectively; in 1914-15, £7,629,000 and £6,330,000.

**RAILWAYS.** Providing additional and adequate railway facilities for India by 1916 had become a most serious problem. The Indian Railway Board, in order to determine a definite policy for the future sought the opinion of commercial bodies on the subject, and they were asked whether in their opinion state-managed or company-managed lines had given the best services to the public. In the meantime the members of the board were personally investigating the problem in all its bearings.

The Railway Board during the year sanctioned reconnaissance surveys by the Great Indian Peninsula Railway for the following lines of railway on the 2-feet 6-inch gauge: (1) from Damoh, on the Great Indian Peninsula Railway, to Amangang via Hatta, a distance of about 60 miles. (2) From Mau-Ranipur, on the Great Indian Peninsula Railway, running north to Garotha and south via Tehri to Maraura, with a connection from Tehri to Lalitpur, a distance of about 120 miles.

**SHIPPING.** Shipping engaged in the foreign trade, with cargo and in ballast, is shown in the following table:

Entered:	1913-14		1914-15

The chief ports are Calcutta and Bombay: next in importance are Karachi, Rangoon, and Madras.

**COMMUNICATIONS.** The total length of railway in operation in British India and the native states, March 31, 1915, was 35,285 miles, as compared with 34,656 in 1914. In 1915, state lines operated by the state totaled 7364 miles; state lines operated by companies, 18,810 miles; companies' lines subsidized by the government of India, 2214 miles; native state lines operated by native states, 2240 miles.

Telegraphs March 31, 1915: 10,661 offices, with 84,112 miles of line and 330,033 miles of wire. There are several radiotelegraph stations under government operation. Post offices, March 31, 1915, 19,158, as compared with 18,946 in 1914.

**FINANCE.** The standard unit of value is the British pound sterling, the par value of which is \$4.86656; but the current coin, as well as the common money of account, is the rupee, worth one-fifteenth of the pound sterling, or 32.444 cents. For the fiscal year ending March 31, 1917, the budget estimate of the gross revenue of British India was £86,199,600, and the estimate of expenditure £85,147,200.

The following table shows the principal sources of gross revenue for fiscal years, in thousands of pounds sterling (revised estimates for 1915-16, and budget estimates for 1916-17):

	1912-13	1913-14	1915-16	1916-17

The table below shows for fiscal years the principal items of gross expenditure charged against revenue, in thousands of pounds sterling (revised estimates for 1915-16 and budget estimates for 1916-17). The first item, direct demands on the revenue, includes refunds and drawbacks, assignments and compensations, together with collection charges, which comprise

hend land revenues, excise, customs, etc., with production costs in the salt and opium monopolies:

	1912-13	1913-14	1915-16	1916-17

\* Working expenses are treated as deduction from revenue instead of expenditure. † The additions are the portion of allotments to provincial governments not spent by them in the year. ‡ The deductions are the portion of provincial expenditure defrayed from provincial balances.

In addition to expenditure charge against revenue, there was capital expenditure on railways and irrigation amounting, in 1912-13, to £10,738,694; in 1913-14, £12,365,740; in 1915-16 (estimate), £5,769,200 and £333,300 in connection with the new capital at Delhi; in 1916-17 (estimate), £3,705,900 and £266,700 at Delhi.

On March 31, 1915, the public debt stood at £320,729,023, as compared with £307,391,127, in 1914.

**GOVERNMENT.** The King of Great Britain and Ireland is Emperor of India. In England, the administration of Indian affairs is intrusted to the secretary of state for India (a member of the British cabinet). In India, the executive authority rests with the governor-general in council. The council consists of six members, appointed by the crown, and of the commander in chief of the army in India. The governor-general has a legislative council, which, in addition to ex-officio members, consists of 28 official and 32 non-official members (including 27 elected). There are similar legislative councils in Bengal, Bombay, Madras, Bihar, and Orissa, the United Provinces, the Punjab, the Central Provinces, and Berar, Assam, and Burma. The native states are governed by their princes, ministers, or councils, but the Government of India exercises control in varying degrees. In March, 1916, Baron Hardinge of Peshurst was succeeded as governor-general by Baron Chelmsford.

#### HISTORY

**THE VICEROY.** Lord Hardinge's term officially would have expired in November, 1915, but before that date was reached there was so much objection to his withdrawal that the government consented to extend the term until the end of March, 1916. At assemblies of the Indian National Congress and other native bodies, resolutions were passed praying for a further extension of the term, but this the government was unwilling to grant. Everywhere there had been the greatest satisfaction with the Viceroy's administration and it had been hoped that he might continue throughout the war, but there were serious objections to the prolongation of the

term for an indefinite time. On January 14th, the appointment of Lord Chelmsford was announced officially. Lord Chelmsford had held the office of Governor of Queensland, and afterward that of New South Wales, where his administration was highly successful. At the time of his appointment he was serving as captain in his Territorial regiment in the Himalayas.

**LORD HARDINGE'S VICEROYALTY.** Characteristic of Lord Hardinge's administration as reviewed in the press appears to have been the fact, in the first place, that he possessed the confidence of the people. He showed much tact in dealing with the disturbances that arose early in his viceroyalty. Soon after the war broke out there was a spontaneous display of loyalty on the part of the natives. Attempts to cause dissension by means of German agents were reported, and for some time there were very disturbed conditions in the Punjab and in lower Bengal, but the Viceroy dealt with these vigorously and yet showed a spirit of clemency toward many of the accused. In short his policy resulted in the swift suppression of these disorders. As to the Mesopotamian campaign the question of Lord Hardinge's share of the responsibility remained unsettled. During his administration there were many important legislative changes. The new capital was established. The Bengal provinces were rearranged. Changes were made in the provincial administration. Some of the features of his administration were his cordial relations with the princes and chiefs, the great amount of attention he devoted to educational progress, his vigorous conduct of external politics, his concern in the events of the Burmo-Chinese frontier, and his friendly arrangements with the Government of Afghanistan. He also did much to promote favorable relations between India and the rest of the Empire, especially in the matter of indentured emigration. Another policy of his which won him support in India was his effort to secure for India official representation in the next Imperial Conference.

**INDENTURED LABOR.** It was announced by the Viceroy on March 21st that the policy of providing for the eventual abolition of indentured labor in Jamaica, Trinidad, British Guiana, Dutch Guiana, and Fiji had been accepted by the Secretary of State for India. The system of indenturing coolie labor outside India began in 1842, and of late years had been under the regulation of the Emigration Act of 1883. It was required that no native should emigrate except under a contract to certain countries which had given the British government guarantees that satisfactory measures would be taken for their protection. The recruiting of such labor was carried out under licensed agents. Formerly they were taken to certain territories outside the British Empire, but in 1886 emigration to the French colonies was prohibited and there remained only Dutch Guiana outside the British Empire. Of late years about 10,000 coolies have emigrated annually under average conditions. Many of them remain permanently in the countries to which they are sent, after the expiration of their term of indenture. On an average only about 4000 or 5000 have returned to India. Great numbers of them have remained in South Africa. In Natal alone the number of coolies permanently settled was estimated in 1910 at 10,000. This condition of things led the Indian

government to prohibit emigration to Natal. Immigration to Mauritius ceased in 1910. The decision to put an end to this system was received with hearty approval among the natives, who have been strongly opposed to the system, regarding it as a badge of slavery. In his announcement Lord Hardinge said that the present system of recruiting would have to continue until a new method had been worked out with the Colonial Office and the crown colonies concerned.

**INDIAN LOYALTY.** There were some signs of disaffection, and these were seized upon in hostile quarters and magnified. German reports of disorders were denied, but on April 14th it was learned from the Secretary of State for India that two uprisings had been suppressed in the Punjab and Bengal, though they were characterized as unimportant. On May 19th Lord Hardinge admitted that in the previous year there had been seven attacks of a serious nature by the tribesmen of the northwest border. Again on July 20th Lord Crewe implied that but for the presence of British troops in Mesopotamia, which had impressed the Mohammedans with a show of force, there might have been a serious disaster. The change of administration with the appointment of the new Viceroy on July 14th caused no crisis. The Indian National Congress at Bombay, December 31st, and the All-Indian Moslem League Congress both declared their loyalty, but at the same time demanded more autonomy for India. The Sultan Mohammed Agha Khan, also declared that the Mohammedan population was unswervingly loyal. Official statements showing the contributions of India to the imperial cause were issued from time to time. British India and the protected states had furnished 21 cavalry regiments and 76 infantry battalions. From India had come 300,000 troops, who were distributed in France, China, Egypt, Mesopotamia, East Africa, Gallipoli, and Kamerun. The native princes offered contributions and personal services as well, and one of them, the Maharaja of Mysore, had given \$1,665,000. Moreover, as proof that no serious disturbance was threatened, the fact was cited that the army of occupation, ordinarily 73,000 strong, had been reduced to less than 15,000.

**INDIANA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 2,826,154. The population in 1910 was 2,700,876.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture in 1915-16, were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	5,137,000	174,658,000	\$146,713,000
1915	5,025,000	190,950,000	97,884,000
Wheat . . . . . 1916	1,620,000	19,440,000	82,854,000
1915	2,750,000	45,580,000	46,492,000

1915	13,000	364,000	287,000

a Tons. b Pounds.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914.

	1909	1914
Number of establishments . .	7,969	8,022
Average number of wage earners . . . . .	186,984	197,503
Capital Invested . . . . .	\$508,717,000	\$668,863,000
Wages . . . . .	95,510,000	119,259,000
The value of materials used .	334,375,000	423,857,000
The value of products . . . . .	579,075,000	730,795,000

**MINERAL PRODUCTION.** The coal production of the State in 1916 was estimated at 19,000,000 tons, compared with 17,600,152 in 1915. The greater part of this increase was in Knox County, and the fields of the north, and was made in the last six months of the year. There were local strikes in the year, which affected labor for a period, in some of the large mines. The mines also suffered from car shortage. Shipments were made during the year to points as far east as central New York, and large quantities were shipped to Ohio and Michigan.

The petroleum marketed in the State in 1915 amounted to 4,269,591 barrels. The oil field of the State is a part of the Lima, Ind., field. By far the larger production is obtained from the fields situated in Ohio. There was little activity in developing new territory during the year. The production of coal in the State in 1915 was 17,600,152 short tons. This was an increase of about 2 per cent over the production of 1914. The number of men employed in the mines of the State during the year decreased from 23,175 in 1914 to 22,777 in 1915.

**TRANSPORTATION.** The total railway mileage of the State in 1916, was 7791. Roads having the longest mileage were the Pittsburgh, Cincinnati, Chicago, and St. Louis, 751; New York Central, 464; Lake Erie and Western, 741; Cincinnati, Hamilton, and Dayton, 609; Chicago, Indianapolis, and Louisville, 595.

**EDUCATION.** The total number of school children in the State in 1916 was 774,342. This includes children between the ages of 6 and 21. The enrollment was 564,252, and the average daily attendance 463,920. The number of teachers employed was 19,648. The average yearly salary of teachers was \$587.51. The total amount expended for teaching in the public schools of the State was \$11,553,513.

**FINANCE.** Statistics for the finances of the State are available for only as late as 1914. In that year the total receipts from all sources, including balance of \$378,271, was \$12,922,278. The expenditures for the fiscal year left a balance on hand on Sept. 30, 1914, of \$649,964.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Indiana Reformatory at Jeffersonville, the Indiana State School for the Deaf at Indianapolis, the Central Hospital for the Insane at Indianapolis, the Indiana State School for the Blind at Indianapolis, the Indiana State Prison at Michigan City, the Indiana Boys' School at Plainfield, the Soldiers' and Sailors' Orphans' Home at Knightsville, Indiana Women's Prison at Indianapolis, School for the Feeble-Minded at Fort Wayne, the Northern Hospital for the Insane at Logansport, Eastern Hospital for the

Insane at Richmond, Southern Hospital for the Insane at Evansville, State Soldiers' Home at Lafayette, Indiana Girls' Home at Clermont, Southwestern Hospital for the Insane at North Madison, Indiana Village for Epileptics at New Castle, and the Hospital for the Treatment of Tuberculosis at Rockville. There is also a State farm at Putnamville. There were about 15,000 inmates in these institutions in 1916. They are maintained by appropriations from the State general fund made biennially by the Legislature.

**POLITICS AND GOVERNMENT.** The 1916 election in Indiana resulted in the defeat of the Democratic State and national tickets, and the return of the State to the Republican column. It also marked the practical wiping out of the Progressive party which maintained an organization, but polled only an insignificant number of votes although it was the second party in 1912. The important issues in the State were the Federal Adamson railroad law, the record of the Democratic party in State and local affairs which was attacked by the Republicans, the administration of the public utilities law, dissatisfaction with which was general, gang rule and machine politics in Indianapolis and other large cities of the State where the Democratic party was in power, and the question of tax reform. Public interest in the election was slow in awakening, but it became keener and the finish of the campaign was one of the most exciting in years, marked by great demonstrations, "red fire" parades and other features characteristic of old-time campaigns.

James P. Goodrich, candidate for governor on the Republican ticket, based his appeal for election primarily on promises of economy in State affairs, reform of the existing tax system, and of public utilities commission practices. J. A. M. Adair, the Democratic candidate for governor, the incumbent of the office, Governor Samuel L. Ralston, and other Democrats, placed emphasis on the achievements of the national administration and used as a slogan "the State is out of debt and the nation out of war."

The Republican State platform criticized the Wilson administration, favored a merchant marine, adequate preparedness, public economy, a State budget system, tax reform, and road improvements; it opposed entangling alliances, criticized the State primary law, and denounced "pork barrel" methods. The Democratic State platform praised the record of the party in State and national affairs. Tax reform and the public utility commission issues were touched on in general terms, economy was pledged, and the existing liquor laws were approved. Neither party definitely committed itself to prohibition or woman suffrage.

Indiana was singularly situated among the States in having a candidate for Vice-President, each of whom had held that office, on the tickets of each of the major parties, and the prohibition candidate for President, ex-Governor J. Frank Hanly. Thomas R. Marshall, Democrat, was reelected Vice-President over Charles W. Fairbanks, his Republican opponent.

Affairs in Marion County, in which Indianapolis, the largest city of the State, is situated, are believed to have had an important bearing on the outcome of the State election. A number of officials in that county were indicted for

fraud at a preceding primary and election, policemen were charged with driving voters from the primary polls, and several city employees were indicted for graft in connection with padded payrolls. The Republican plurality in the county was about equal to the plurality of that party in the State.

Owing to the death of Senator Shively early in 1916, two Senators instead of one were elected to fill out the State delegation. Thomas Taggart had been appointed by Governor Ralston to serve out Senator Shively's term until the first general election and he was later nominated by the Democratic State convention as a candidate for the remainder of the dead Senator's term against James E. Watson, the second choice of the Republican primary, which nominated Harry S. New for the regular vacancy. John W. Kern, Democratic incumbent, was the candidate against Mr. New for the long term. Both Republicans were elected.

The official vote in the senatorship contest follows: Long term—Harry S. New (Republican), 337,089; John W. Kern (Democrat), 325,588; John N. Dyer (Progressive), 4272; Joseph Zimmerman (Socialist), 21,558. Short term—James E. Watson (Republican), 325,193; Thomas Taggart (Democrat), 325,577; John S. Clifford (Progressive), 4798; Edward Henry (Socialist), 21,626.

For President the vote of the two leading candidates was: Hughes, 341,005; Wilson, 334,063.

In the governorship contest the vote was: James P. Goodrich (Republican), 337,831; J. A. M. Adair (Democrat), 325,060.

The entire Republican State ticket was elected by corresponding or somewhat smaller pluralities. The Republicans elected 9 of Indiana's 13 Congressmen, and the Democrats 4, against a representation at present of 11 Democrats and 2 Republicans. Wilson ran ahead of the Democratic State ticket by several thousand votes and Hughes led the Republican State ticket, but Hughes's plurality over Wilson was smaller than that of any of the other Republican State candidates over their respective opponents.

A movement was begun during the year to start a number of State parks for the preservation of the most impressive scenic tracts and historic spots in the State. Governor Ralston issued a proclamation calling upon the people of the State for contributions of money needed for the purchase of the sites.

On February 7th city officers, convicted in 1915 in election conspiracy cases, were released from the Federal penitentiary, having served their term. A large number of officials, including the former mayor and sheriff, remained in prison. Their conviction was sustained by the United States District Court of Appeals in Chicago on February 2nd. These men are serving terms ranging from two to five years.

**INDIANA, UNIVERSITY OF.** A State co-educational institution at Bloomington, Ind., founded in 1820. In the fall of 1916 the students numbered 2002 and the faculty 196. During the year Dr. H. L. Smith was elected dean of the School of Education to take the place of Dr. W. W. Black, resigned. Morton C. Campbell and Warren A. Seavey were elected to professorships in the School of Law. The productive funds of the institution amount to \$614,690, and during the year 1916 the income from all sources was \$764,370. The library contains 108,000 volumes. President, William L. Bryan.

**INDIANS. EDUCATION AND HEALTH.** A health campaign carried on in the various Indian reservations during the year resulted in a decrease in the death rate of approximately seven per thousand during 1916. Special attention was given to the health of infants. Additional physicians were employed and hospitals were constructed and placed in operation to aid in the campaign for better health. Educational facilities were provided for 1295 Indian children without school opportunities. A special effort was made for Navajo Indian children for whom facilities were provided for an increase of over 260 children. Arrangements were made for the enrollment of 2025 children. New courses of study were introduced in all the schools of service. A series of institutes was held during the summer in various places. Especial attention was given to industrial and economic courses.

**INDUSTRIES.** Great improvement was shown in the advancement of Indian industry during the year. This is shown by the fact that free rations were issued to 3807 able-bodied Indians as compared with 6650 for 1915. The total individual income of Indians under Federal supervision increased from \$15,308,665 in 1915 to \$15,069,515 in 1916. The number of Indian farmers increased from 31,956 in 1915 to 35,658 in 1916, the cultivated acreage from 664,539 to 668,552, and the value of crops produced from \$4,790,968 to \$5,293,719. See also ANTHROPOLOGY.

**INDIAN TRAINING AND INDUSTRIAL SCHOOL, UNITED STATES.** A non-sectarian co-educational institution for American Indians, at Carlisle, Pa. It was founded in 1879. In the fall of 1916 there were 769 students and 65 instructors. The school is supported chiefly by the Federal government, Congress appropriating annually about \$150,000 for this purpose. Two farms owned by the school are worked by the students and make a substantial contribution to its sustenance. In 1916 the library had 4000 volumes. President, Oscar H. Lipps.

Burma, Siam, the Malay states, and the Straits Settlements proper. See these titles.

**INDUSTRIAL ACCIDENTS.** See OCCUPATIONAL DISEASES; WORKMEN'S COMPENSATION.

**INDUSTRIAL DISEASES.** See OCCUPATIONAL DISEASES.

**INDUSTRIAL RELATIONS COMMISSION.** This body was authorized by Congress in 1912. It was composed of nine persons equally divided between representatives of the public, employers, and employees. Its function was to inquire into the causes of industrial unrest, and, with an appropriation of \$500,000 and three years' time, it carried out an elaborate inquiry. Its *Final Report* was summarized in the 1915 YEAR BOOK. On April 28, 1916, Congress authorized the printing of 100,000 copies of this *Final Report* and of 10,000 copies of the testimony and findings. These were available for distribution by Senators and Congressmen at the close of the year in a set of 11 volumes of about 1000 pages each. Here will be found the testimony of prominent business men, labor leaders, economists, publicists, and other experts on every phase of the relations of labor and capital.

**INDUSTRIAL WORKERS OF THE WORLD.** The I. W. W. had its inception in the Colorado strike of 1903. Its organization was brought about by a combination of the Western Federation of Miners, the United Metal Workers, and the Labor Alliance in 1905. It has since split into two branches, with headquarters at Chicago and Detroit. It favors direct action, including sabotage and the general strike, favors industrial unionism in opposition to trade unionism, opposes resort to customary political methods, preaches industrial revolution and the immediate confiscation of capital goods.

During 1916 the organization was active in various parts of the country. In the summer I. W. W. members had fights in South Dakota with independents organized against them for work in the harvest fields. In New York City they took an active part in the garment workers' strike. They were also responsible for wrecking the offices of *Il Progresso Italo-Americano*, an Italian newspaper, because the editor had refused to aid a propaganda for the release of labor organizers imprisoned in Virginia, Minn., on a charge of murder. Several agitators were later indicted on the charge of inciting the riot. In September the I. W. W. members attempted to tie up the Jermyn & Company collieries at Scranton, Pa. The employees were about evenly divided between the I. W. W. and the United Mine Workers, and as the latter would not join in the strike it is alleged that the I. W. W. pickets tried to keep them away from their work. The burghs being unable to cope with the situation, the sheriff was summoned. A raid on a secret meeting was made by him with the aid of deputies and State troopers and 267 strikers were arrested on a charge of riot. The court on September 16th refused to give an immediate hearing on a writ of habeas corpus and also refused to reduce the bail totaling \$1,500,000 for those under arrest.

Elizabeth Gurley Flynn, who achieved notoriety in the Paterson strike of 1913, was acquitted in her trial at Paterson in December. Two years previously the jury had disagreed.

The testimony of detectives and policemen as to statements made by her was not given consideration. Her defense was carried out through a committee of 81 persons, including Mrs. O. H. P. Belmont, Mrs. Rose Pastor Stokes, Mrs. Inez M. Boissevain, and other noted women of New York, and William English Walling, Amos Pinchot, and five progressive clergymen, including the Rev. Percy Stickney Grant.

In the naturalization court at Wilkes-Barre, Pa., May 3rd, Judge Peter A. O'Boyle announced that members of the I. W. W. could not obtain citizenship papers in that county because they are undesirable as citizens since they countenanced and even instigated trouble and used un-American means in voicing their displeasure with conditions of which they did not approve.

As an outgrowth of a strike of shingle weavers, a pitched battle between 250 members of the Industrial Workers of the World on a steamer and a posse of citizens took place at Everett, Wash., November 5th. Trouble had been brewing for some months with several minor outbreaks in connection with the strike. After the outbreaks all members of the I. W. W. were forcibly expelled from Everett by a citizens' committee organized for the purpose. Some returned and were again forcibly ejected. But in October the official organ of the I. W. W., the *Industrial Workers*, called for 2000 volunteers to avenge the forcible expulsion of men at Everett and to "vindicate the right of free speech." Two steamers were chartered for the occasion. These boats with 400 armed men on board left Seattle, November 5th. The first boat to reach Everett was met at the wharf by the sheriff and posse of deputies and citizens, who refused to let the I. W. W.'s land. After some arguing, shooting was begun: about 1000 shots were fired and about 40 persons were injured and 7 killed.

Patrick Quinlan, an I. W. W. agitator, sentenced to serve not less than two years in the New Jersey State Prison for inciting riots in the Paterson silk strike of 1913, was released November 24th. Quinlan had written a letter to Judge Abram Klenert apologizing for the language which he had directed against the courts. This apology, Quinlan's failing health, and petitions from 22,000 persons asking the liberation of Quinlan, caused his release.

**INSANITY.** The National Committee for Mental Hygiene has pursued its work of surveying the mental defectives throughout the country, with the help of the Rockefeller Foundation, and operating from 50 Union Square, New York. Interest in the prevention of insanity as well as of feeble-mindedness is fully aroused in several States. Somewhat on the lines of the work of the Committee for Mental Hygiene, Jackson, of the Philadelphia Hospital for the Insane, has suggested a plan for the establishment of bureaus of mental hygiene as subdivisions of departments of health. In

Philadelphia the proposed bureau would work through various psychiatric centres, the physicians thereto assigned acting as inspectors who are assigned to hospitals for contagious diseases. Thus is the matter placed on the basis of quarantine, as suggested by Adolf Meyer, then of New York, in 1907. The advantages claimed are: Improved care with less cost of the indigent insane; avenues afforded for investigation and research, and for establishment of clinics; weeding out borderland cases, separating the acute and recoverable, and securing early treatment; relieving the psychiatric wards of general hospitals; permitting return home of recovered or improved patients under social service workers; and protecting the patient and society from harm.

Abbott, of the staff of Waverley, Mass., Hospital for the Insane, lists as avoidable, forms of mental disease, feeble-mindedness, dementia præcox, manic-depressive psychoses, psychoses due to destructive disease of the brain, toxic psychoses, and others. He urges that manic-depressives be treated as fatigue psychoses, and urges rest and food in all cases of easy fatigue, as a preventive measure. He states that fully 12½ per cent of the cases of insanity admitted are due to alcoholism, and in an indefinite number it is the precipitating cause, and urges instruction of the public without prejudice or sentiment.

Urstein's observations upon soldiers suffering from mental disturbance resulted in the establishment of the fact that even fractures of the skull, hemorrhages, and other circumscribed lesions may affect the mind. Mental confusion usually appears immediately after the brain trauma, though in some cases after some hours or days. Delirium and somnolence are unfavorable symptoms, often denoting brain abscess or meningo-encephalitis. The most frequent psychosis was katatonia, next frequently psychopathic constitutional anomalies, epileptic insanity, and finally manic-depressive states. Exhaustion psychoses and hysterical cases were noted. It seemed to Urstein that psychoses among soldiers developed only upon a predisposition.

The Board of Control of Lunacy in England has issued a report showing increase in insanity. In 1859 36,480 insane persons were under control in England and Wales. In 1899 there were 100,000, and in 1915, 140,466. In the same period, private lunatics had increased in number from 4397 to 9968. In 1859 the ratio to population was 18.5 per 10,000, rising to 37.7 in 1915. These figures are not quite accurate, because the diagnosis of insanity is more exact to-day, and many formerly ignored cases are under public care. But a decided increase is beyond doubt. Causes assigned include syphilis, alcohol, tobacco, sexual excess, overstrain, and over-excitement. Mercier, of London, considers that insanity may be due to excessive indulgence in fat or sugar. In the face of these reports, a striking decrease of lunacy is observed in London. Pauper, criminal, and private patients numbered 20,886 Jan. 1, 1916, compared with 21,539 a year before, while the total number (including those in workhouses and at home) was 28,252, against 29,211 in 1915. Private patients decreased from 488 to 458, in the same time. There is proportionately a greater reduction of males,

The decrease of London's lunatics is assigned to the reduction of poverty, due to the employment consequent on the war, and the withdrawal of a large part of the male population from civil work to the army. The annual reports of the commissioners of lunacy for England and Wales, as well as for Scotland, and of the inspector of lunatics for Ireland, are not obtainable this year.

The Massachusetts Board of Insanity reported on Nov. 30, 1915, a total of 14,746, being 1 insane to every 250 of the population of the State. In addition, there were 941 patients temporarily absent from institutions, and a considerable number of others in the community who had been previously discharged or had never appeared in institutions for the insane. Of the total stated, 7169 were males and 7577 females, and of these 107 men and 243 women, total 350, were in private institutions. These figures show an increase over 1915 of 615 public and 9 private patients, total 624; and over 1914 and 1913 of respectively 356 and 401. All admissions to public institutions and McLean Hospital were 4171, during the year, compared with 4068 the previous year. The increase this year was 103, as compared with a decrease of 17 the previous year. Voluntary admissions of insane reached 685 as against 543 the previous year. Of this number, 81 in public institutions and 3 in McLean required subsequent commitment. First admissions numbered 3147, compared with 2986 the year before. Of the first cases, 45.59 per cent were of foreign birth, and 70.39 per cent of foreign parentage. Alcohol was a causative factor in 17.06 per cent, heredity in 16.65, senility in 10.17, coarse brain lesions in 5.82, and syphilis in 9.66 per cent. The mental disease was classed as curable in 21.48 per cent of first cases, compared with 21.20 a year before, and 22.69 for the last five years' average. Of the first admissions, manic-depressive psychoses numbered 12.23 per cent; acute alcoholic insanity, 5.02; dementia præcox, 25.55; chronic alcoholic insanity, 4.48; senile dementia, 9.02; general paralysis, 8.23; and coarse brain lesions, 8.80 per cent. Following were the discharges: 410 as recovered; 305 as capable of self-support; 794 as improved; 510 as not improved; and 167 as not insane (alcoholics, deliria, etc.).

New York changed the beginning of her fiscal year from October 1st to July 1st, thus making comparison of previous figures difficult. By adding one-third of each nine months' figure to itself, a fair result may be reached. In New York, June 30, 1916, the number of the committed insane and voluntary patients in State hospitals, together with committed insane in licensed private retreats, were 17,863 men and 19,718 women, making a total of 37,581 patients (an increase of 918 over last year); of which number 1402 were inmates of Matteawan and Dannemora, the criminal institutions, and 966 were in licensed private retreats. There were 1340 on parole from civil hospitals. The net increase in the civil hospitals for the nine months was 905, against 939 for the year 1915, and 691 for two years ago. During the nine months 208 were returned to other States or deported to foreign countries, against 490 the previous year, great difficulties operating to prevent ocean travel of patients. The total number admitted to civil hospitals for the year

was 6223, of which number 4903 were first admissions, and 1320 were readmissions. From the 14 civil hospitals 1186 were discharged as recovered, and 1216 as improved; while 2522 died during the period. The amount disbursed for maintenance was \$5,657,739.42. Upon new buildings, extraordinary repairs or equipment, or emergencies was expended the sum of \$506,607.98. The per capita cost of maintenance for the period, omitting calculation of the cost of lodging, was \$165.32, averaging \$220.43 for a year, against \$210.25 last year. The ratio of the insane to the general population of the State was 1 to 261.

The chief contributing cause of insanity, next to heredity, is syphilis, and alcohol is the determining cause in many cases. These two preventable causes were, in 1916, precipitating factors in 22.7 per cent of the new admissions in the civil hospitals.

Of the first admissions during the past year, 48.5 per cent were of foreign birth, and 76.3 per cent of foreign or mixed parentage.

In the attempt to limit the procreation of the unfit, laws have been passed in several States, authorizing certain officials to sterilize certain insane, feeble-minded, epileptics, and recidivists. The operation of the laws has been impeded by a lack of public sentiment in most cases, in spite of the startling figures of the proportion of the dependent and unfit as well as the criminal, whose ranks would be much depleted in a generation were the classes named prevented from propagating their kind. The American Institute of Criminal Law and Criminology gives the following summary of the want of activity in the various States in this field: Indiana, no operations since 1908; Washington, no operation in a year, no report; California, insane, 634, criminal 1, since passage of law; Connecticut, insane 21, since passage of law; Nevada, no operations; Iowa, no operation under old law; New Jersey, no operations; New York, no operations, and a case pending before the courts; Michigan, no operations; Kansas, no information, and no operations up to 1915; Wisconsin, feeble-minded, 24. In Washington alone the law is punitive. See also CHARITIES.

**INSECTS.** See ENTOMOLOGY.

**INSECTS, PROPAGATION OF DISEASE BY.** See ROCKY MOUNTAIN SPOTTED FEVER.

**INSTITUTE OF FRANCE.** See ACADEMY, FRENCH.

**INSURANCE.** The notable developments of the year in insurance was the rapid adoption of the idea of group insurance by large corporations, the increased ramifications of insurance against all sorts of social and industrial contingencies, and the continued readjustment of rates by some of the large fraternal orders. For the strike of the agents of the Prudential Company, see STRIKES AND LOCKOUTS; see also WORKMEN'S COMPENSATION.

**LIFE INSURANCE.** According to the report of the superintendent of insurance in New York State the total assets of the 37 life insurance companies doing business in that State were \$4,850,000,000 on Dec. 31, 1915. This was an increase of \$214,000,000 over the preceding year. Of the total assets 45 per cent was credited to 12 New York State companies and the remainder to companies of other States and other countries. Among the assets were included bonds and mortgages, \$1,571,

000,000; stocks and bonds, \$2,168,000,000; loans on policies, \$691,259,000; and real estate, \$150,709,000. The capital of these companies amounted to only \$9,889,000, 24 of them being mutual concerns, and the others having small capital sums, except the Prudential with \$2,000,000, the Aetna with \$2,500,000, and the Columbian National, the Provident Life and Trust, and the Pittsburgh Life and Trust with \$1,000,000 each. The surplus of these companies aggregated \$144,670,000; and other special funds, \$109,187,000. Other items of liabilities included reinsurance reserve, \$4,071,403,000; and dividend funds, \$390,764,000. The total income of the 37 companies during 1915 was \$925,732,000. Of this premiums constituted \$684,632,000; and interest and dividends on stocks and bonds, \$211,815,000. The total disbursements were \$713,643,000, of which \$288,288,000 were for death claims; \$113,365,000 for lapsed, surrendered, and purchased policies; \$106,065,000 in dividends to policy holders; \$57,762,000 for commissions; and \$58,356,000 for salaries, medical fees, and wages. The total number of policies in force on Dec. 31, 1915, was 8,288,228, an increase of 438,500 during the year. Total insurance in force was \$15,632,739,000, an increase of \$699,689,000 during the year. It was estimated that the above companies represented fully 90 per cent of the life insurance business of the United States.

**GROUP INSURANCE.** The past few years have seen a very notable development of the insurance of all employees of one employer under a blanket contract known as group insurance. Under this scheme in return for premiums paid monthly by the employer each employee is insured for an amount ranging as a rule from \$500 to \$3000. Customarily expensive medical examination is dispensed with, being in part offset by the more superficial health requirements of employers. The amount of insurance for each employee is based on his individual earnings with the maximum limit above indicated. An individual certificate bearing the name of the employee and his beneficiary is given to each of the insured. New employees are automatically included under the scheme by changes in the premium and outgoing employees are automatically dropped from the list of insured. Such insurance is designed to create good will toward the firm on the part of the working force and is believed to be "good business" by progressive employers, who find that increased loyalty and contentment result in increased output. The cost to the employer approximates  $1\frac{1}{4}$  per cent to  $1\frac{1}{2}$  per cent of the annual payroll, or about \$1 per month for each \$1000 of life insurance. Contracts frequently provide for the payment of benefits in 12 monthly installments in place of one lump sum. Thousands of employees received such insurance certificates as Christmas presents in December, 1916; but there were several instances of employees refusing to accept them on the ground that insurance certificates were being given in place of justly deserved increases in pay.

**Union Pacific Plan.** The most notable instance of group insurance was the plan of the Union Pacific Railroad announced in December. This involved first a wage bonus to all employees (40,000 in number) of one month's pay, except those employed less than one year and those receiving more than \$1800 per year; secondly,

life insurance for 30,000 employees consisting of one year's pay, but not less than \$500 nor more than \$2500, and payable in monthly installments (in case of permanent disability such insurance is convertible into a benefit payable in at least five annual installments); thirdly, accident insurance with payment of half wages for various periods according to the seriousness of the disability; and fourthly, sickness insurance amounting to a maximum of half wages for 52 weeks.

**FIRE INSURANCE.** The average estimated fire loss in the United States and Canada from 1910 to 1915 inclusive was \$225,000,000. This sum was not greatly exceeded in any of these years, though when such disastrous conflagrations as the Chelsea fire of 1908, the San Francisco disaster of 1906, or the Baltimore fire of 1904 occur losses are enormously greater. Three-fourths of the annual loss is believed to be preventable. According to the report of the New York Insurance Department there were 242 fire and fire-marine companies doing business in that State in 1915. Of these 194 were joint-stock companies and 48 mutuals. These companies possessed total assets of \$735,676,000. Stocks and bonds owned were valued at \$522,083,000; real estate, bonds, and mortgages, \$84,687,000; cash, \$59,068,000; and uncollected premiums, \$59,178,000. Among the liabilities of these companies were capital, \$92,698,000; net surplus, \$244,881,000; and unearned premiums of \$331,191,000. Their income totaled \$419,377,000; of this fire premiums amounted to \$342,057,000, and marine and inland premiums to \$28,110,000; interest and dividends, \$27,355,000. Their total disbursements were \$380,552,000, of which \$177,730,000 went for fire losses; \$13,053,000 for marine and inland losses; \$25,276,000 for dividends; \$78,296,000 for commissions; and \$29,225,000 for salaries, expenses, and wages of employees. Of these companies 206 received \$42,468,000 more than they spent, whereas 36 expended \$3,643,000 more than they received. These 242 companies together with 22 companies devoted exclusively to marine insurance covered total risks on Dec. 31, 1915, of \$64,998,000,000. During that year these companies assumed aggregate risks of \$75,494,000,000 for gross premiums amounting to \$643,744,000, an average premium of \$0.85 for every \$100 insured.

The foregoing statistics show that on the whole fire insurance rates are not in general exorbitant, but rather barely large enough to cover losses and expenses under existing methods of conducting the fire insurance business. Many companies were dependent upon interest not only for their entire increase in surplus and reserves, but also to meet part of their losses. The extent of the fire insurance business is only partially indicated by the above statistics, since there are great numbers of small companies not represented in New York State. Moreover, in that State there were 33 advance premium cooperative fire insurance companies with \$153,109,000 insurance in force; 66 county assessment companies with \$328,728,000 insurance in force; and 69 town assessment companies with \$58,529,000 insurance in force on Dec. 31, 1915. See also FIRE PROTECTON.

**CASUALTY, CREDIT, FIDELITY, AND SURETY INSURANCE.** The various forms of insurance included here have grown very rapidly in the United States during the past decade. They

include all kinds of insurance against accidents, business losses, burglaries, workmen's compensation, and other social and business contingencies. The New York Insurance Department report for 1916 showed that the 77 companies in this field in that year had total assets of \$203,303,000. Their capital was \$46,355,000, and surplus \$33,858,000. Other liabilities included reserves for unpaid losses \$42,622,000, and unearned premiums of \$63,367,000. Their aggregate premiums for the year were \$141,411,000, distributed over the following sources: accidents, \$25,745,000; health, \$6,768,000; liability, \$34,306,000; workmen's compensation, \$31,850,000; fidelity and surety, \$22,016,000; plate glass, \$4,687,000; steam boiler, \$3,018,000; burglary and theft, \$4,695,000; automobile damage, \$5,562,000; other minor classes, \$2,753,000. During the year these companies paid claims of \$58,409,000, dividends to stockholders of \$4,960,000, and expenses of \$78,145,000. Twenty-six of them showed an underwriting loss of \$5,098,000, while 51 of them showed an aggregate gain from underwriting of \$4,278,000; there was thus a net loss from underwriting of \$820,000. This, however, was much more than offset by gains from investment operations. Here again the figures are indicative only of the operation of companies doing business in one State; while these include the largest concerns of the country, there are great numbers of similar corporations operating outside of that State.

**FRATERNAL INSURANCE.** An important aspect of life insurance in the United States has been the great popularity of fraternal insurance, in spite of the fact that 50 years' history shows that a large proportion of such organizations sooner or later fail. Such failure has been due primarily to actuarial unsoundness in organization; rates have proven adequate while membership was young and growing rapidly in numbers, but inadequate when members reached more advanced years, a consequently higher death rate, and growth in size was proportionately small. During 1915 and 1916 the Knights and Ladies of Honor was placed in the hands of a receiver; an investigation of the society by the New York Insurance Department was completed in May, 1916. This was the fate also of the New York branch of the Ancient Order of United Workmen. The Royal Arcanum for a second time readjusted its rates in 1905; but a third readjustment was necessary, being announced about December 1st. The increases in rates ranged from 5 cents a month per \$1000 at age 18 to \$2.33 a month at age 65. At age 30 the regular rate per month per \$1000 was increased from 72 cents to 91 cents; and proportionate increases were made up to age 65 where the increase was from \$5.36 to \$7.69 per month. It was expected that from 60,000 to 100,000 members would leave the organization on account of the high rates.

While there are hundreds of these fraternal organizations in the country the 74 large ones represented in New York State showed total assets Dec. 31, 1916, of \$157,251,000; their liabilities were \$24,512,000, their income for the year \$89,417,000, and their disbursements \$78,011,000. Some of the largest of these organizations with the number of their certificates and total insurance in force Dec. 31, 1916, were the following: Supreme Tribe of Ben Hur, 100,018, \$108,128,920; Independent Order of Brith Abra-

ham, 200,142, \$100,071,000; Order of Brith Abraham, 66,367, \$33,183,500; Independent Order of Brith Sholom, 49,870, \$24,519,700; Brotherhood of American Yeomen, 208,169, \$276,851,000; Catholic Mutual Benefit Association, 64,187, \$82,748,000; Catholic Women's Benevolent Legion, 15,917, \$10,542,875; Independent Order of Foresters, 190,125, \$185,994,871; Fraternal Mystic Circle, 16,883, \$16,776,000; French Canadian Artisans' Society, 41,834, \$32,304,202; Improved Order of Heptasophs, 63,336, \$85,842,000; Knights of Columbus, 111,815, \$118,242,443; Knights and Ladies of Honor, 51,740, \$47,600,166; Knights of Pythias, 70,860, \$96,430,990; Ladies Catholic Benevolent Association, 150,900, \$125,766,000; Ladies of the Modern Macabees, 41,749, \$31,014,250; Macabees, 308,561, \$373,243,322; Modern Woodmen of America, 940,225, \$1,499,561,500; National Slovak Society of the United States of America, 40,252, \$29,457,750; National Union, 57,910, \$106,583,500; Order of United Commercial Travelers of America, 73,062, \$365,310,000; Polish National Alliance of the United States of North America, 107,261, \$61,368,600; Protected Home Circle, 92,489, \$79,709,500; Royal Arcanum, 243,095, \$455,120,000; Royal Neighbors of America, 283,911, \$293,037,250; Travelers Protective Association of America, 53,102, \$265,510,000; Woman's Benefit Association of the Macabees, 170,224, \$129,109,926; Supreme Forest of Woodmen Circle, 155,421, \$152,997,600; and Sovereign Camp of Woodmen of the World, 751,058, \$1,007,932,400.

**INTERNAL COMBUSTION ENGINES.**

In 1916 few installations of large gas engines were recorded in the United States and comparatively little was heard from Europe on account of the war. In some large steel mills gas engines of usual type were placed and in the new and novel designed power plant of the Ford Motor Company, at Detroit, a producer plant was being built in connection with the immense gas-steam units where every precaution was being taken to recover all waste heat. The completion of this plant was looked forward to by engineers, as it was believed that it would determine the efficiency and status of the producer gas engine as a prime mover, operating as it would, under the most advantageous circumstances. The usual number of gas engines were installed in the natural gas regions. A number of producer plants were constructed, though as regards the latter it was thought that the high price of coal, if sustained, might direct increased attention to this form of prime mover on the score of economy of fuel. The year, however, saw a marked increase in the use of oil engines, and Diesel engines were being manufactured by an increased number of works, including three large shipbuilding plants. The demand for Diesel engines was particularly strong in the South and Southwest and was not restricted to any one line of industry, mines, refrigerating plants, flour mills, pumping and other central stations all using this type of machine in the various sizes in which it was being manufactured. The Diesel engine was finding increased use for marine propulsion (see SHIP-BUILDING) and at the same time an entrance

into this field was being secured for the medium-compression type oil engine, whose makers hitherto had restricted themselves to the stationary form. In all internal combustion engines the standard type seemed to be the four-stroke-cycle engine and but few of the two-stroke-cycle engines which previously had promised to become popular were being built. Of course the most general use of internal combustion engines was in automobile vehicles and there were several features of interest during the year in this connection which are discussed under **AUTOMOBILES**.

**INTERNAL REVENUE.** See **LIQUORS; TOBACCO**.

**INTERNATIONAL CORPORATION, AMERICAN.** This corporation was formed in November, 1915, by leading American financiers under a charter which authorized it to undertake any activity necessary to the development of legitimate business. Working in close cooperation with the National City Bank (New York) which had begun to develop international banking and with the firm of Stone and Webster, building and construction engineers, the Corporation undertook in 1916 a most remarkable series of commercial, industrial, and financial enterprises. During the first year, ending December 1st, there were 1230 propositions submitted to the Corporation relating to developments of various kinds in European countries, South and Central America, China, Japan, and the United States. Its manager, Charles A. Stone, reported net profits of \$2,231,000 for the year. It secured a large interest in the reorganized International Mercantile Marine Company, the great South American firm of W. R. Grace and Company, the United Fruit Company, the Pacific Mail Steamship Company, and the New York Shipbuilding Company. With others it organized the American International Terminals Company to study all kinds of shipping terminals, railway and ocean, throughout the world and to construct the same including warehouses. This corporation was thus a very striking evidence of the new spirit in American business reaching out for a due share of world trade and preparing the way for the investment of large sums of American capital in foreign countries.

**INTERNATIONAL INSTITUTE OF AGRICULTURE.** See **AGRICULTURE**.

**INTERNATIONAL LANGUAGE.** As the war goes on, the idea of the International Language is discussed more and more—from two stand points: Either to hasten reconciliation between the warring nations, or to hold strongly together the nations which fight side by side and which will need a strong bond after the war. There are various projects. On the Entente side: The Chapelier plan, to the effect that English will be required in all schools of French-speaking countries, and French in all schools of English-speaking countries. Its most influential advocate, Michel Bréal, died in 1915; but others took it up; e.g., the well-known writer Ernest Charles, in *L'Opinion* (September 16th): "Pour le Français et l'Anglais, contre l'Esperanto." He answers a pamphlet by H. Muffang, *Langue Internationale, Point de vue national*. Muffang, attacking the Chapelier plan, had maintained, first, that "never would the other nations consent to learn two difficult languages . . . both French and

English are more difficult than Esperanto"; and further that "English being indisputably easier than French, and moreover used by many more people, French would be in a short time outdistanced, and France would before long be only an English province"—this is his "point de vue national." E. Charles answers: If the Allies learn Esperanto, the Germans will soon come to favor Esperanto vigorously in order to kill French and English as international languages; and, later, when they have used Esperanto to kill French and English, they will substitute German for Esperanto. A linguist of note, Dauzat, proposes a somewhat modified form of the Chapelier plan, having in view France especially; namely that two foreign languages be required in secondary schools after the war; one would be English all over France; the other would be German in the east and north; Spanish in the west and southwest; Italian in the southeast; in large cities, the pupils might have the choice between one of the three last named; in Paris and Lyons one might add Russian or Arabic as the second elective.

In England, the following motion, considered on July 20th at the common council, at the Guildhall, London, and proposed for examination to the Board of Trade, sums up the situation: "That in view of the fact that England and the Allies are entering into arrangements for concerted action with regard to future trade matters, it would be of immense value if one language could be recognized as the commercial language, and taught in all schools, here and abroad. By so doing, English, French, Russian, Esperanto, or any other language decided on, would form the basis of communication on business matters throughout the world."

On the other side is Germany: In the conquered provinces, Poland, Alsace, Belgium, they have enforced German as the language of the people. Ostwald, the famous scholar, at one time an Esperantist, but now a defender of Pan-Germanism, has come forward with a proposition that a simplified German be made the international language, the *Welt-Deutsch*.

We may add that in England the British Post Office recognizes Esperanto as a modern European language for telegraphic purposes; while in France, in 1916, it had been decided to forbid for correspondence during the war, such languages not known to the censors, among them any system of shorthand, Hebrew, and Esperanto.

Whether Esperanto is, or is not, used cunningly in an unneutral way by the Germans to prevent national languages of the Allies to prevail as world languages, it is certainly true that many Esperantists have used it for purely humanitarian purposes, and unaware of the help they may unconsciously give the German cause. (See discussion in the *New York Sun*, end of November and beginning of December, between some occasional correspondents.) The 1915 YEAR BOOK has spoken of the work done in Geneva by international committees with the help of Esperanto; in 1915 these people handled 97,415 letters in Esperanto (statistics are not yet available for 1916). Propaganda goes on in the prisoners' camps, civilian and military, in Holland and Saloniki, and probably elsewhere.

The situation is about this: In Russia, the movement was not much disorganized by the war; in Germany, it remained well organized; in France it was most disorganized; in neutral

countries it was also rather deeply disorganized. In Germany they published in Esperanto, almost since the beginning of the war, the official war news, sent to them directly from headquarters; in Germany, also, they used it a great deal to "expose the lies of the Allies"; and in France they answered in it, although not officially. Congresses were held in England and in Switzerland. Remarkable progress has been made since the war in the Far Eastern countries. Several new Esperanto periodicals have been started, both in China and Japan. There had been no real Chinese movement for Esperanto until two or three years ago, and the Chinese Esperanto Association in Shanghai sold in the last year no less than 89,000 textbooks. In Japan, a beginning had been made some years ago, then there had been a slump, then a vigorous start again. In both countries they publish now their own textbooks. Some interesting publications of the year: *Quaker Stronghold*, the well known book by Caroline Stephen, was translated under the title: *Fundamentoj de la Kvakerismo* (by M. C. Butler, of London); in Germany, Friedrich Hebbel's *Gyges kaj lia Ringo*. On the eve of the war, the Esperantists had published B. von Suttner's *Waffen Nieder! : For la Batalilojn*. The translation of the Old Testament by Zamenhof, has been completed, but the manuscript has not yet been taken to England for print, on account of the war.

The cause of Esperanto was helped considerably, although indirectly, by the untimely death of the great scholar, Couturat (automobile accident, early in 1916). Couturat, one will remember, had proposed a plan of reform of Esperanto, and called the improved Esperanto, *Ido*—which had aroused greatly the conservative Esperantists. With him the cause of *Ido* will probably be doomed forever. But his efforts will not have been vain altogether, for it was due to his energetic action, and to the fear of him, that the Esperantists finally were forced to acknowledge that serious improvements could be made on the *fundamento*, or original Esperanto, and agreed to make them gradually. Couturat had completed shortly before his death, the *Dictionnaire Français-Ido* (par. L. de Beaufront et L. Couturat), *Linguo Internacia di la delegataro, Sistemp Idó* (Paris, 1915).

**INTERNATIONAL LAW.** See CONTRA-BAND OF WAR; UNITED STATES AND THE WAR; WAR OF THE NATIONS.

**INTERNATIONAL PEACE AND ARBITRATION.** There was practically no substantial advance toward international peace during 1916 and none toward international arbitration, although these subjects were among those most discussed by the public and press. The various peace and arbitration organizations have been prolific of suggestions and efforts. The continuance of the European war with unabated zeal and violence has, of course, been responsible for this condition of affairs which will undoubtedly continue until a conclusive peace has been agreed upon by all the belligerents. In the meantime there is a difference of opinion among peace workers as to the desirability of maintaining an active propaganda for peace in war times.

**CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE.** The executive committee of the endowment, in its latest report (that of April, 1916), said that it may have seemed to some that ow-

ing to the conditions prevailing in Europe during the preceding year, the endowment would be unable to accomplish the same amount of work as formerly until the return of peace. An examination of the reports of the administrative officers sent to the trustees shows, however, that such is not the real condition. "The secretary has made a somewhat detailed examination of the work in several lines of administration, and a comparison of the work of the year which has just closed with that of the previous year shows a very considerable increase of activities. . . . The division of intercourse and education has, during the year, devoted its labors and funds to the extension of its operations in the United States and South America. The work of the division of economics and history is of such a character that it is not feasible to substitute any considerable amount of exactly similar work in the western hemisphere for the activities interrupted in Europe. Steps have been taken to collect material concerning the war for use in preparing an economic history after its close. . . ."

Recently there has been some public criticism of the trustees for what is described as their inactivity and lack of initiative, in the cataclysm which has overwhelmed Europe and is affecting disastrously all the countries of the eastern hemisphere. In commenting on these facts the executive committee said: "This criticism is reflected also in the endowment's correspondence. Letters are frequently received suggesting that the endowment ought to do this or that; and the suggestion is often accompanied by the assurance that the writer is just the person to undertake it. Every proposition of this character is given careful consideration by the committee; nothing has been suggested in this direction which has seemed to possess practical value for the purpose in view. Moreover, the public criticisms and comments have been singularly lacking in helpful suggestions.

"In so stating, the committee does not wish to be understood as implying any condemnation of the many earnest men and women who have been active and enthusiastic in work which has for its purpose the arousing of public feeling to the horrors of war, and interesting the people in methods whereby it is hoped that their recurrence may be limited or prevented. Many organizations for that purpose have sprung up throughout the United States, independent of the existing societies which have long been working in this field; most of these have their own particular plan, programme, or panacea, by which the organizers think it possible to accomplish the end in view; some of them are solicitous for the coöperation and financial assistance of the Carnegie Endowment, and unable to understand why it is not instantly granted.

"Three reasons why may be stated, already familiar to those who read the *Year Book* of the endowment. First, the endowment deems it wise to do its work through organizations with long-established records for usefulness and efficiency. Second, the endowment is largely engaged, directly and effectively, in peace propaganda, through its division of intercourse and education. Third, it is clear that a concentration of effort in this field, through well organized and well officered organizations, is a wiser

policy than the indiscriminate encouragement of new societies, many of them ephemeral in character, and some of them organized for the exploitation of views and proposals on the subject of international peace which do not commend themselves to the judgment of the trustees of the endowment.

"A common criticism directed against the endowment takes the form of the questions: What is the endowment doing to stop the European war? and, What is the endowment doing to see to it that other wars do not follow the present one?"

"The answer is obvious. The endowment has taken no steps to stop the European war. Its trustees recognize the fact that a private organization is not in a position to take any such steps, with any possibility that any useful results can follow. No private organization, by whomsoever organized and officered, is in any such position; and therefore the endowment has extended no financial assistance to any group of men or women organized for that purpose. The determination of these matters is primarily in the hands of the governments of the belligerent nations. None of them has been or is in a frame of mind to tolerate such interference, or to regard it as other than an impertinence. The terms and conditions of that peace depend entirely upon the outcome of the war. No human being can foresee what that outcome will be. The basis of the peace will be determined by events which time alone can develop. Then, again, it is well known that the Government of the United States has sounded the belligerents and offered its good offices, and it is obviously not the function of a private organization to compete with the government.

"In this connection, and as the endowment's answer to the criticisms directed against it, the committee can not do better than to quote from the statement issued by the trustees under date of Feb. 16, 1915, and widely circulated at that time. What was said in this statement remains as true to-day as when written. It still represents and explains the attitude of the endowment:

"We wish to say to all friends of peace that the dreadful war now raging affords no just cause for discouragement, no discredit to past efforts, and no reason to doubt that still greater efforts in the future may be effective and useful.

"The war itself is teaching the gospel of peace through a lesson so shocking and so terrible that the most indifferent can not fail to attend and understand it.

"Not only have the destruction of life, the devastation and the suffering in the warring countries passed all experience, but the cessation of production, the closing of markets, the blocking of trade routes, the interruption of exchanges, have affected industry and caused ruin and poverty in all the peaceful countries of the world.

"The universal interdependence of nations has been demonstrated and the truth forced upon every mind that the peace of all nations is the vital concern of every nation.

"To cast our weak protest now among the tremendous forces that are urging on the great conflict would be futile; but the end of this war will come before long, and then the great question will stand for answer:

"Shall the lesson be forgotten; the sacrifice lost?"

"That question the belligerent nations only will have the power to answer; but every one in the world will be entitled to be heard upon it, for it will be a question of civilization, the most momentous of our era.

"It seems incredible that after this the stricken people will set their feet in the same old paths of policy and suspicion which must lead them again to the same result.

"Finding expression through a great multitude of voices everywhere the general public opinion of mankind should influence the minds of the negotiators who settle the terms of peace and inspire them to a new departure in the establishment of justice as the rule of international relations.

"While we must not be overconfident of our individual qualifications to point out the detailed methods through which the result may be accomplished, we may still advocate measures which seem practicable and appropriate to the purpose.

"We can see that definite rules of national conduct should be agreed upon; that a court of competent jurisdiction should be established to judge of national conformity to those rules; and that new sanctions should be provided to compel respect for the judgments rendered.

"Above all the motive and spirit of the new institutions should be clearly and fully not the promotion of ambition or the extension of power, but the safeguarding of human rights and the perfection of individual liberty.

"Toward this high end the courage and hope and conviction of the humblest citizen of the most distant land may contribute."

LEAGUE TO ENFORCE PEACE, WORLD'S COURT LEAGUE, WORLD PEACE FOUNDATION. These and sundry other organizations have been unremitting in their efforts to advance the particular objects of their organizations. The programmes of the first two named are identical in several respects.

The League to Enforce Peace favors a league of nations to secure: (1) A judicial tribunal for all justiciable questions not settled by negotiation; (2) an international council of conciliation; (3) conferences of signatory powers from time to time, to formulate and codify rules of international law valid unless vetoed by some signatory power within a stated period; (4) joint use of economic forces against a signatory power which refuses to submit any question to court or council before committing hostilities; joint use of military forces against a signatory which actually begins war before such submission.

The World's Court League favors a league among nations to secure: (1) An international court of justice for all justiciable questions not settled by negotiation; (2) an international council of conciliation in addition to the Permanent Court of Arbitration at The Hague; (3) world conferences meeting regularly at shorter intervals than heretofore, to establish the court and council, to formulate and codify rules of international law valid for all nations which approve them; (4) a permanent continuation committee of the world conferences with such powers as the conferences may grant.

The distinguishing difference between the two lies not in the objects they are seeking, but in

the methods to be used to secure the adoption of these objects. Neither body is trying to stop the present war. The League to Enforce Peace concedes that no human agency can prevent all wars, any more than a police force, however efficient, can suppress all crime. It would, however, use combined moral, economic, and military power against any member-nation that commits an act of war against another member without first submitting its grievance to tribunal or council and awaiting complete examination. It proposes to abolish secret diplomacy, which has brought on so many wars, substituting therefor delay and public discussion, because it believes that nations are like men: the longer they talk the less likely they are to fight.

Both of the national parties and their candidates endorsed the principles of the league, as did the Chamber of Commerce of the United States, President Wilson, ex-President Taft, and Viscount Grey, while serving as British foreign secretary. In an address before the Foreign Press Association (October 23rd) Viscount Grey said:

"I believe the best work neutrals can do for the moment is to try to prevent a war like this happening again. If nations had been united by such an agreement, and had been prompt and resolute to insist in July, 1914, that the dispute be referred to a conference or to The Hague, and that the Belgian treaty be observed, there would have been no war.

"The belligerent countries are fighting for their existence. There are daily increasing prospects of seeing victory brought nearer, but still, knowing that if they stop short of victory they stop short of everything for which they have been struggling, they cannot be expected to spend much time thinking about what might happen after the victory is secured. But neutrals can.

"I observe that not only President Wilson, but also Mr. Hughes, the other candidate for the presidency, is supporting the league, which was started, not with the object of interfering with the belligerents in this war, but with the object of establishing an international association after the war is over which will have its part in making peace secure in the future.

"Although we have little time to give ourselves while engaged in this struggle, it is a work for neutral countries on which we all look with favor and hope. Only we must bear this in mind, that if the nations after the war are able to do something effective in binding themselves to the common object of preserving peace, they must be prepared to undertake not more than they are able to uphold by force and to see to it when the time of crisis comes that it is upheld by force. The question we must ask them when the time comes is:

"Will you play up when the time comes?"

"It is not merely the sign manual of presidents that will really make that worth while. There must also be behind it the parliaments and the national sentiments. The object of this league is to make treaties be kept and further resorts tried before war. Before the war started in 1914 there was no such league. Supposing the conditions of 1914 occur again and there is such a league in existence. Everything will depend upon whether the national sentiment behind it is so penetrated by the les-

sons of this war as to compel each nation as a vital interest to keep the peace."

On November 9th the German Chancellor, von Bethmann-Hollweg, declared in the Reichstag:

"We have never concealed our doubts with regard to the question whether peace could be permanently guaranteed by such international organizations as arbitration courts. I shall, however, at this place not discuss the theoretical aspects of the problem, but we must now and at the time of the conclusion of peace from the point of view of facts define our position with regard to this question. When at and after the end of the war the world will become fully conscious of its horrifying destruction of life and property, then through the whole of mankind will ring a cry for peaceful arrangements and understandings, which, as far as lies in human power, shall avoid the return of such a monstrous catastrophe. This cry will be so powerful and so justified that it must lead to some result. Germany will honestly cooperate in the examination of every endeavor to find a practical solution of the question, and will collaborate to make its realization possible. This all the more, if the war as we expect and trust, will create political conditions, which do full justice to the free development of all nations, the small ones as well as the great nations. Then it will be possible to realize the principles of justice and free development on land and of the freedom of the seas."

In commenting on this in a message sent to Rev. Charles S. Macfarland, the general secretary of the Federation of Churches of Christ in America, Prof. Adolf Deissmann of the University of Berlin, one of the signers of the statement on the part of the intellectuals issued at the beginning of the war, which was also signed by Harnack, Eucken, and Haeckel, said:

"The above is not the private opinion of an individual, but the voice of our leading statesmen. The echo which this straightforward address, so full of strength and national dignity, has found in our press, confirms my impression, that the idea of arbitration is constantly gaining ground in our country. Nov. 9, 1916, will therefore not only be a memorable day in the history of our country but also a landmark in the history of humanity. Our geographical position compels us to consider the question soberly and not to surrender to sentimental dreams, for now as always self-defence is our sacred duty. But just because we are a powerful nation we are at all times ready and willing to come to an honorable understanding.

"Of course, if attempts to form an international alliance for maintaining lasting conditions of peace are to be practically realized, the mental and spiritual atmosphere within the great powers must change. The gangrenous ulcer of hate, which poisons international relations, must be burnt out and the intellectual heads of nations, above all the Christian leaders, must under full recognition of the bona fides of their opponents, be ready to forgive one another's thoughts as well as words and deeds, whereby they have hurt and wounded each other. Then they would be able to succeed in fully entering into the problem of reconstruction. In creating this atmosphere, which is prerequisite to every step towards a better mutual understanding, neutral Christians have a great mission. Without pharisaism and by the proper

attitude which avoids everything that might pour oil on the flames of war, they should regard combatants as suffering brethren, nurse their wounds and reconsider the attitude of their hearts and minds."

Prof. Ellery C. Stowell of Columbia University published in *The Nation* (December 7th) an extended argument pointing out the danger of the proposed league as contrasted with the advantages of using and extending the present machinery of arbitration provided by The Hague Tribunal.

Samuel T. Dutton, formerly of Columbia University, and organizer of the New York Peace Society, has been made general secretary of the World's Court League, and Frank Chapin Bray editor of *The World Court*, its official organ.

In this latter publication, James Brown Scott of the Carnegie Foundation and special adviser to the Secretary of State, urged the calling of a third Hague Conference on the conclusion of the war, to which every country belonging to the society of nations shall be invited and in whose proceedings every such country shall participate; he also advocated a stated meeting of the Hague Peace Conference which, thus meeting at regular, stated periods, will become a recommending if not a law-making body. In his opinion, a legislature or parliament in the national and ordinary sense of the term cannot be created for nor be accepted by the society of nations, without a radical reorganization of the society of nations, difficult and time-consuming, and perhaps impossible to bring about. A frequent and stated meeting of the Hague Conference, which is a legislature *ad referendum*, that is, a diplomatic and recommending body, will accomplish much the same result, as the conventions and declarations adopted by the conference and submitted to the participating nations for their careful examination and approval become, as Dr. Brown pointed out, at one and the same time, upon ratification by the nations and the deposit of ratifications thereof at The Hague, national laws and international statutes. The process is indirect between nations instead of direct as within nations; the form is different, but the effect the same. He also suggested an agreement of the states forming the society of nations concerning the call and procedure of the conference, by which that institution shall become not only internationalized, but in which no nation shall take as of right a preponderating part; and further to request the appointment of a committee, to meet at regular intervals between the conferences, charged with the duty of procuring the ratification of the conventions and declarations and of calling attention to the conventions and declarations in order to ensure their observance. He also advocated the creation of an international council of conciliation.

Another of the peace foundations restricting its activities during the war is the World Peace Foundation (40 Mt. Vernon Street, Boston). Another reason for this curtailment has been the foundation's active and vigorous support of the programme of the League to Enforce Peace. The trustees of the foundation as a body are convinced that the league's programme embodies the most hopeful and feasible set of reforms likely to be realized in international fields following the war, and, with that conviction have done everything in their power to bring this

programme to the attention of the American public. The foundation has assisted by grants of money, assignment of staff, provision of office quarters, and the issuance and distribution of publications.

There has been no sacrifice of the foundation college and general educational work. It organized, and contributed to the expenses of, the Conference on International Relations held at Western Reserve University, Cleveland, Ohio, June 21st to July 1st. The foundation sustained the monthly *International Polity News*, the organ of the Federation of International Polity Clubs, but this work has now been relinquished to the American Association for International Conciliation. The foundation's regular activity of distribution of peace literature and the dissemination of accurate information has continued in increasing proportion throughout the year.

On December 27th, Edward Cummings, general secretary of the foundation, issued a statement respecting President Wilson's note of December 18th to the belligerent powers, in which he asserted that the significance of the President's move lay in the official offer by the United States to take a part in a League to Enforce Peace after the war.

The Sixth National Conference of the American Society for Judicial Settlement of International Disputes was held at Washington, December 8th-9th. The usual number of publications were issued during the year.

AMERICAN ASSOCIATION FOR INTERNATIONAL CONCILIATION (407 West 117th Street, New York). This organization continues its policy of publishing the more important documents relating to the present European war, proposals of peace, and addresses having for their object the promotion of a more friendly feeling among nations. Those printed during 1916 were published in a bound volume in 1916. Those issued during this year included: *America's Opinion of the World War*, by Eduard Bernstejn, translated by John Mez; *International Coöperation*, by John Bassett Moore; *The Outlook for International Law*, by Elihu Root; *Documents Regarding the European War*, Series No. XII: "Statement of Measures Adopted to Intercept the Sea-Borne Commerce of Germany," presented to Both Houses of Parliament by Command of His Majesty, January, 1916; *Great Britain's Measures Against German Trade*, a speech delivered by the Rt. Hon. Sir E. Grey, Secretary of State for Foreign Affairs, in the House of Commons, on the 26th of January, 1916; *German White Book on Armed Merchantmen*; *Speech of Imperial German Chancellor before the Reichstag, on April 5, 1916*; *The Proposal for a League to Enforce Peace*, affirmative, William Howard Taft, negative, William Jennings Bryan; and a long series of special bulletins.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. At its quadrennial meeting (December 6th-11th) in St. Louis, the Federal Council pledged itself afresh to the cause of "world peace through world justice." The name of the Commission on Peace and Arbitration was changed to the Commission on International Justice and Goodwill. The report of the commission (400 pages) is a record of many accomplishments and gives promise of work for the future. The closing section called

to the churches to cooperate in the instruction and inspiration of Christian citizens, and their guidance in methods of constructive activities. "World peace can come by no mechanical or merely political contrivance. It will come only as an expression of character and good sense."

The Quadrennial Council endorsed the movement and work of the World Alliance for Promoting International Friendship through the Churches, and urged each of its 30 affiliated denominations that had not already done so, to establish a commission to cooperate with the alliance, at the same time instructing its commission to cooperate in every practicable way with the American Council of the World Alliance. The council further "urgently recommended each local congregation to establish at once its 'peace makers committee' and to take up during the winter the important activities proposed for such committees in the education of our citizenship in their responsibilities for more effectively Christianizing America's international relations and policies."

**EPISCOPAL CHURCH.** At the General Convention of the Episcopal Church held in St. Louis on October 17th, the following resolution was adopted:

"Whereas, Present conditions call for a clearer recognition of the Christian principles of the brotherhood of men; the practice of righteousness and good will between nations as between individuals; the substitution of judicial processes for war in the settlement of international disputes; and the embodiment of these principles in national policies and laws, not merely as an abstract ideal, but as a practical conviction for whose development the Christian churches have special responsibility; therefore be it

"Resolved, That a commission be appointed consisting of 10 bishops appointed by the chairman of the house of bishops, and 10 presbyters and 10 lay communicants appointed by the president of the house of deputies, with power to fill vacancies and to add to their number, whose duty it shall be to promote the spread of the desire for peace in the world and international friendship, and to relate their operations to the World Alliance for Promoting International Friendship through the Churches to that end."

**NATIONAL ECONOMIC LEAGUE** (6 Beacon Street, Boston). The league published two reports on the most practicable means of promoting peace, and subsequently devoted an issue of its magazine to a discussion of the conditions and problems after the war.

**UNITED NATIONS.** In a pamphlet entitled "Constitution of the United Nations of the Earth," Edgar D. Brinkerhoff (Fall River, Mass.) has with great ingenuity drawn up a "Constitution of the United Nations of the Earth," somewhat on the lines of the Constitution of the United States of America, the aim of this being to secure peace by a union of all nations. This Parliament of the United Nations is to consist of a senate and a "duma"—to have the power to levy taxes, to borrow money on the credit of the United Nations when necessary, or provide for an "efficient" standing army and navy, and to declare war on nations outside of the union. There are provisions for a currency of the central government, but it is not compulsory on any

dominion to use this currency internally. Each nation is free to choose for itself between a monarchic and republican government. Under one section of the "constitution" nations are represented in the lower house according to population. Russia is to have 55 members, France 32, Germany 25, the British Empire 143, and the United States 36. The central government is not left dependent upon any national government for contributions of men, arms, or money. This "constitution" defines treason as levying war against the United Nations or adhering to their enemies, and the disqualification of all senators or "dumaists" by rebellion.

**AMERICAN INSTITUTE OF INTERNATIONAL LAW.** On Jan. 6, 1916, the Institute adopted a declaration of principles which are themselves based upon decisions of English courts and of the Supreme Court of the United States.

1. Every nation has the right to exist and to protect and to conserve its existence; but this right neither implies the right nor justifies the act of the state to protect itself or to conserve its existence by the commission of unlawful acts against innocent and unoffending states. (Chinese Exclusion Case, 130 U. S. 581, 606; Regina vs. Dudley, 15 Cox's Criminal Cases, p. 624, 14 Queen's Bench Division 273.)

2. Every nation has the right to independence in the sense that it has a right to the pursuit of happiness and is free to develop itself without interference or control from other states, provided that in so doing it does not interfere with or violate the rights of other states.

3. Every nation is in law and before law the equal of every other state belonging to the society of nations, and all nations have the right to claim and, according to the Declaration of Independence of the United States, "to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them." (The Louis, 2 Dodson 210, 243-44; The Antelope, 10 Wheaton 66, 122.)

4. Every nation has the right to territory within defined boundaries and to exercise exclusive jurisdiction over its territory and all persons whether native or foreign found therein. (The Exchange, 7 Cranch 116, 136-7.)

5. Every nation entitled to a right by the law of nations is entitled to have that right respected and protected by all other nations, for right and duty are correlative, and the right of one is the duty of all to observe. (United States vs. Arjona, 120 U. S. 476, 487.)

6. International law is at one and the same time both national and international; national in the sense that it is the law of the land and applicable as such to the decision of all questions involving its principles; international in the sense that it is the law of the society of nations and applicable as such to all questions between and among the members of the society of nations involving its principles. (Buvot vs. Barbuit, Cases Tempore Talbot, p. 281; Triquet vs. Bath, 3 Burrow, p. 1478; Heathfield vs. Chilton, 4 Burrow 2015; The Paquete Habana, 175 U. S. 677, 700.)

**NEUTRAL CONFERENCE FOR CONTINUOUS MEDIATION.** This conference was formed as a result of the Ford Peace party of 1915-16, and though wholly unofficial, is in some real degree representative. According to Emily Green Balch who was the sole American present at its meet-

ings held during 1916 at Stockholm, Sweden, delegates were present from six neutral countries. In Switzerland, Holland, Sweden, Norway, and Denmark national committees served as the constituencies and the agents of this central committee. Only the United States delegates have had, as it happens, no such support. Consequently the character and work of the conference were quite naturally, according to Miss Balch, much less understood in America than in Europe. Efforts to get Spanish representation failed, owing to war-time difficulties of travel and communication.

The first phase of the conference, in which the national delegations were set at five each, lasted from the middle of February to the middle of April and was mainly occupied with formulating two appeals, one to neutrals asking for the calling of an official conference, the other to the belligerents proposing specific peace terms for a just and reasonable settlement. This "Appeal to Governments, Parliaments, and Peoples of the Belligerent Nations" was at once published, and also personally submitted to the Stockholm representatives of the belligerent governments. Not only did the neutral press print this in full, but Austria, Germany, Great Britain, Italy, and Russia permitted its appearance, and the French-Swiss press gave it at least some access to France. The national delegations were subsequently reduced to two each.

In the opinion of many students and publicists one of the most important developments during 1915-16 has been the influence of the European war upon Pan-American solidarity, commerce, and friendship. No international event since the declaration of the Monroe Doctrine in 1823 has done more to bring about a true appreciation of Pan-American interdependence than the European conflict. Likewise it is believed that the great Pan-American Scientific Congress which assembled in Washington last December-January (INTERNATIONAL YEAR BOOK, 1915, p. 334) under the auspices of the Pan-American Union, of which John Barrett was secretary-general, was undoubtedly one of the most important international gatherings ever held on the western hemisphere. There were in attendance more official delegates than have participated in any other Pan-American conference, and it opened the way to strengthening friendly relations through education, sciences, art and literature, as well as through commerce and opportunity.

The Pan-American Union itself, as the great international official organization of the 21 American republics, has done more than ever before in its history to advance the best interests of each and all of the republics and to cement the closest ties of friendship and trade.

**INTERNATIONAL HIGH COMMISSION.** Another important event was the meeting of the International High Commission at Buenos Aires in April. This was attended by official delegates from all the American republics, who adopted many resolutions for the working out of closer official and commercial relations. The committee reports and resolutions have been published by order of the central executive council by the American government. The permanent organization of the commission was provided for in the following resolution:

*Resolved,* That, the sections of the several participating countries continue until the next

meeting of the International High Commission. Each section shall consist of nine members, of whom the minister of finance shall be chairman. It shall select a vice-chairman from among its number, and a secretary, who may or may not be a member of the section;

That a central executive council be constituted whose duty it shall be to centralize and coordinate the labors of the commission, to keep the several sections in constant touch with one another, to carry out the conclusions of the International High Commission and the Pan-American Financial Conferences, and to prepare the programme, reports, and all other material necessary for the holding of the second meeting of the International High Commission:

That the above mentioned central executive council consist of a president, a vice-president, and a secretary of the section of the country which may be selected as the seat of the said central executive council, and act until the next meeting of the International High Commission. All expenses incurred by the central executive council shall be borne by the country in which it shall be established;

That the central executive council submit to the various sections a draft of the proposed rules of procedure, and all observations and communications relating thereto be transmitted by the central executive council to each section, in order that the said rules of procedure may be approved at the next meeting of the International High Commission;

That the next meeting of the International High Commission be not held until two years from this date. It shall be held thereafter upon request from at least five sections. The place and date of meeting shall be fixed after all the sections have been consulted, and shall be determined by a majority vote. As soon as these points have been decided, the call for the meeting shall be issued by the central executive council;

That the various sections may be represented at the meetings of the International High Commission by delegations of not more than five members each appointed by the respective governments. The presiding officer of the meetings of the International High Commission shall be the minister of finance of the country in which the meetings shall be held.

Another resolution dealt with the subject of the next Pan-American Financial Conference:

*Resolved,* That it is highly advantageous that a Pan-American Financial Conference of the character of that held in Washington in 1915 meet every two years; that the next Pan-American Financial Conference take place in 1917 in Washington, the exact date to be agreed upon subsequently among the various governments on the initiative of the central executive council of the International High Commission; that the ministers of finance of all the countries of the American continent be urged to attend in view of the fact that the financial questions there to be discussed constitute the most important problems of these conferences, and in view also of the fact that the presence of these ministers is conducive to the more effective carrying out of the resolutions adopted.

**INTERSTATE COMMERCE COMMISSION.** See RAILWAYS, *Valuation.*

**INTERSTATE GRAND OPERA COMPANY.** See MUSIC, *Opera.*

**IOWA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 2,220,321. The population in 1910 was 2,224,771.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16, were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	10,050,000	366,825,000	\$298,460,000
1915	9,950,000	298,500,000	152,285,000
Wheat . . . . . 1916	660,000	10,450,000	16,802,000
1915	950,000	18,985,000	16,517,000
Oats . . . . . 1916	5,050,000	186,850,000	89,688,000
1915	4,950,000	198,000,000	63,860,000
Potatoes . . 1916	115,000	4,830,000	8,452,000
1915	120,000	12,600,000	8,804,000
Hay . . . . . 1916	8,600,000	5,796,000	52,164,000
1915	8,500,000	6,800,000	54,810,000
Rye . . . . . 1916	55,000	985,000	1,075,000
1915	60,000	1,110,000	888,000
Barley . . . 1916	295,000	8,702,000	7,919,000
1915	275,000	8,525,000	4,177,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . .	5,528	5,614
Average number of wage earners . . . . .	61,685	68,118
Capital invested . . . . .	\$171,219,000	\$233,127,000
Wages . . . . .	32,542,000	39,860,000
The value of materials used .	170,707,000	205,451,000
The value of products . . . .	259,298,000	310,750,000

**MINERAL PRODUCTION.** The coal production of the State in 1915 amounted to 7,614,143 short tons, valued at \$13,577,608, which represents an increase of 163,121 tons in quantity, and \$213,538 in value. The number of men employed in the coal mines of the State decreased from 16,057 in 1914 to 15,549 in 1915.

The coal production of the State in 1916 is estimated at 7,900,000, an increase of about 4 per cent over the production in 1915. The coal produced in Iowa is nearly all used in the State, or is consumed by railroads.

**EDUCATION.** The school population of the State in 1915 was 678,192. There were enrolled in the public schools 522,423, with an average daily attendance of 391,131. There were 24,163 female teachers, and 2628 male teachers. The average monthly salary of male teachers was \$89.17, and of female teachers \$54.07. The total expenditures for education during the year amounted to \$18,704,972. See also **UNIVERSITIES AND COLLEGES.**

**FINANCE.** There was a balance on hand on July 1, 1915, of \$856,045. The receipts for the year were \$8,946,045, and the disbursements \$8,648,265, leaving a balance on hand on June 30, 1916, of \$717,825. The chief sources of revenue are the State tax, motor tax, and receipts from State offices. The chief expenditures are for State schools and for institutions. The State has had no bonded debt since 1892.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State are as follows: Soldiers' Home, Soldiers' Orphans' Home, Clarinda State Hospital (insane), Mount Pleasant State Hospital (insane), Independence State Hospital (insane), Cherokee

State Hospital (insane), School for the Deaf, Institution for Feeble-Minded Children, State Sanatorium for Treatment of Tuberculosis, Industrial School for Boys, Industrial School for Girls, State Hospital and Colony for Epileptics (this institution has not yet been opened to receive patients), State Hospital for Inebriates, State Penitentiary, the Reformatory, Women's Reformatory (institution not yet opened). The total population of these institutions on June 30, 1916, was 9611. The expenditure for their maintenance was \$4,664,789.

**TRANSPORTATION.** The total mileage of main track in the State in 1916 was 9924. This includes interurban lines. Railroads having the longest mileage were the Chicago, Burlington, and Quincy, 1365; the Chicago Great Western, 769; the Chicago, Milwaukee, and St. Paul, 1867; the Chicago and Northwestern, 1610; the Chicago, Rock Island, and Pacific, 2202.

**POLITICS AND GOVERNMENT.** Political interests in 1916 began early on account of the candidacy of Senator Cummins for the Republican nomination for President. A presidential primary was carried by him without opposition, and the State delegation was instructed to vote for him at the convention. Following the presidential primary, interest centred in the primary election for the nomination of party candidates for State offices. For the Democratic nomination for Governor E. F. Meredith of Des Moines had no opposition, although he reversed the historical attitude of his party upon the question of the control of the liquor traffic. He announced that he was for prohibition, and forced a plank to that effect into the Democratic State platform. For the Republican nomination for Governor there was a quadrangular contest, which was won by Lieut.-Gov. W. L. Harding, of Sioux City. The contest between Meredith and Harding developed many bitter controversies. While the apparent issue related to the question of the control of the liquor traffic, Harding having been opposed to prohibition, the determining factor was the attack of the contest on road improvement. Meredith was forced into a position in the public view of being a candidate who stood for paved roads, and the issuance of bonds to build them, although in fact this was not the programme to which he or his supporters were committed. Harding became the candidate of those who erroneously believed that Meredith stood for hard road and bond issues. The liquor issue was practically lost sight of.

The presidential race was submerged in the bitterness of the State contest. Few meetings were held either for Hughes or Wilson. The speeches of the contest were devoted almost entirely to the State campaign. At no time was it believed that Wilson would carry the State, as the Progressive Republicans, who had supported Roosevelt in 1912, had returned to the Republican party.

The result of the election demonstrated the accuracy of this estimate. On the national ticket the Republican vote was won by its normal plurality, while Harding carried the State by twice the plurality given to Hughes. The rest of the Republican State ticket was elected by a plurality even larger than that for Hughes, and the Legislature is Republican by nearly 100 majority on joint ballot. This is significant of the fact that the Legislature for 1914

voted to submit to popular vote a prohibitory amendment and that proposition comes before the Assembly in 1917. Both party platforms pledged candidates to vote for it. The vote for President was: Wilson 221,669, Hughes 280,499, Benson 10,976, and Hanly 9371.

On March 1st, the anti-tipping law of the State was declared unconstitutional by Judge Jepson in a decision rendered in the District Court at Sioux City. The decision was based on the case of a barber arrested for accepting a tip.

**STATE OFFICERS.** Governor, William L. Harding; Lieutenant-Governor, E. R. Moore; Secretary of State, William S. Allen; Treasurer, William C. Brown; Auditor, Frank S. Shaw; Attorney General, H. M. Havner—all Republicans.

**JUDICIARY.** Supreme Court: Frank R. Gaynor, supreme justice; Horace E. Deemer, Scott M. Ladd, William D. Evans, Benjamin I. Salinger, B. W. Preston, Silas M. Weaver, judges; B. W. Garrett, clerk—all Republicans.

**LEGISLATURE.** Republicans, House, 94, Senate 40, on joint ballot, 134. Democrats, House 14, Senate 10, on joint ballot 40. Republican majority, House 80, Senate 30, joint ballot 90.

**IOWA, STATE UNIVERSITY OF.** A State co-educational institution at Iowa City, Iowa, founded in 1847. The total registration in all departments in the autumn of 1916 was 3500. The faculty numbered 298. During the year President Thomas H. Macbride retired, becoming president emeritus, and was succeeded by Walter A. Jessup, who had been dean of the College of Education of the university since 1913. The productive funds of the institution amount to about \$429,200 and from all sources an income of \$1,319,656 was obtained in the last year. The library possesses 125,000 volumes. See UNIVERSITIES AND COLLEGES.

**IPEIGÉNIE EN TAURIDE.** See MUSIC, *Opera*.

**IRELAND.** A large island west of Great Britain; a part of the United Kingdom of Great Britain and Ireland. See GREAT BRITAIN.

**IRIGOYEN, HIPÓLITO.** See ARGENTINA.

**IRON AND STEEL.** The iron ore mined in the United States in 1915 amounted to 55,526,490 gross tons, compared with 41,439,761 gross tons in 1914, an increase of 14,086,749 gross tons, or 34 per cent. The quantity of iron ore shipped from the mines in 1915 amounted to 55,493,100 gross tons, valued at \$101,288,984, compared with 39,714,280 gross tons, valued at \$71,905,074, shipped in 1914. This is an increase in quantity of 15,778,820 gross tons or 40 per cent, and in value of \$29,383,905 or 41 per cent. The average price of iron ore per ton in 1915 was \$1.83, compared with \$1.81 in 1914. Domestic iron ore sold for the manufacture of pig iron amounted in 1915 to 55,475,887 gross tons, valued at \$101,261,528, compared with 39,671,603 gross tons, valued at \$71,790,094, in 1914.

Iron ore was mined in 23 States in 1915, compared with 27 in 1914. Of these States, Idaho, Nevada, and Utah produced ore for fluxing only. Part of the production of California and Colorado was for smelter flux, and part for pig iron and ferro alloys. The remaining States produced for blast furnace use only, except small quantities for sale from Georgia, Michigan, New York, Pennsylvania, and Wisconsin. The States producing the largest quantity of iron ore in the order of production, are as follows: Minnesota, Michigan, Alabama, Wisconsin, and New York. New York was the only one of these States that produced less than 1,000,000 tons in 1915, and it fell little short of that mark. The iron ranges of Minnesota produced more iron ore than all the rest of the States combined, having furnished 60 per cent of the total for the United States in 1915. The Lake Superior districts, comprising all the mines of Minnesota, Michigan, and those in northern Wisconsin, mined 46,944,245 tons, or 85 per cent, compared with 33,540,203 gross tons, or 81 per cent, in 1914. The following tables show the iron ore mined in the United States in 1914 and 1915 by States, and varieties, with a percentage of increase or decrease in 1915.

1914

State	Hematite	Brown ore	Magnetite	Carbonate	Total quantity
Alabama	3,902,567	936,392			4,838,959

a Less than three producers in Colorado and Connecticut in 1915 and in Nevada in 1914, and permission was not granted to publish State totals. Increases and decreases in 1915, therefore, included in "Other States."

b Brown ore included in hematite.

c Hematite included in brown ore.

d Magnetite included in brown ore.

e Colorado, Connecticut, Idaho, and Utah.

There were in 1915 184 iron ore mines active, compared with 164 in 1914. These mines produced more than 50,000 gross tons of iron ore each, and seven produced more than 1,000,000 tons of iron ore each. The first place in 1915 was held by the Mahoning mines in Hipping, Minn., second place by another mine adjoining this, and third by the Red Mountain group, Bessemer, Ala.

While the European war was undoubtedly the cause for the increase of production of iron ore, there was also much additional activity in industries in the United States which employ iron in large quantities. One industry which requires a large quantity of iron and steel, which was extremely active during 1915, was shipbuilding.

IMPORTS AND EXPORTS. The quantity of iron ore imported in 1915 was 1,341,281 gross tons, valued at \$4,181,645. This was a slight decrease over the importations of 1914. Of the ore imported Cuba produced approximately 60 per cent of the amount, and the remainder came from Sweden, Chile, Canada, and Spain. There were exported in 1915, 707,641 gross tons, valued at \$2,181,629, compared with 551,618 gross tons, valued at \$1,794,193, in 1914, an increase in quantity of about 28 per cent and in value of about 22 per cent.

WORLD PRODUCTION. The following table gives the world's production of iron ore as far as statistics are available:

IRON ORE PRODUCED IN PRINCIPAL COUNTRIES, 1911-1915, IN GROSS TONS

Country	1911	1912	1913	1914	1915
<b>North America:</b>					
Canada a	187,807	192,753	274,678	218,620	355,457

a Shipments.  
 b Statistics not available.  
 c Statistics not available. Bosnia and Herzegovina produced 176,014 gross tons.  
 d Germany alone. Figures not available for Luxemburg.  
 e Russia produced 3,536,417 gross tons of pig iron in 1911 and 4,181,890 tons in 1912.  
 f Includes 1568 gross tons argentiferous iron ore, value \$8307.  
 g Exports.  
 h Japan produced 52,228 gross tons of pig iron in 1911 and 55,379 tons in 1912.  
 i Madagascar produced 1.5 tons of iron (metal) in 1911.  
 j Queensland produced 40,838 gross tons and South Australia 60,658 tons in 1913; in 1914, Queensland, 48,090 and South Australia 42,622 tons.  
 k Queensland produced 45,686 gross tons.

It will be noted that comparatively small amounts are credited to other countries than the United States in 1915.

PIG IRON. The production of pig iron of all kinds in 1915 was 29,190,213 gross tons, compared with 23,332,244 tons produced in 1914, an increase of about 28 per cent. The following table gives the production of pig iron in the United States in 1914-15 by States:

more prosperous than the preceding year. In the first five months the shipment of ore from the Lake Superior region was more than 10,000,000 gross tons, or 83 per cent greater than the corresponding period for 1915. Ore prices in the lower lake ports for 1916 were increased 75 cents a ton over those for the season of 1915. The production of coke and anthracite pig iron in the first five months showed an in-

a Bureau of statistics of the American Iron and Steel Institute. Includes some ferroalloys.

The number of blast furnaces in operation on Dec. 31, 1914, was 445. Of these, 156 were in Pennsylvania. The imports of pig iron in 1915 amounted to 89,836 gross tons, compared with 138,903 in 1914, a decrease of 35 per cent. The largest amount came from the United Kingdom. There were exported in 1915, 224,509 gross tons, a decrease of about 96 per cent over the exports of 1914. The largest quantity was sent to Italy.

STEEL. The production of steel in the United States in 1915 amounted to 8,287,213 ingots and castings of bessemer steel, and 23,679,102 ingots and castings of open hearth steel. The production of steel by the electric process amounted to 69,412 gross tons. The manufactured iron and steel imports into the United States in 1915 amounted to 191,066 gross tons, valued at \$5,956,377. There were imported 3,308,097 gross tons, valued at \$137,347,782, compared with 1,330,644 tons, valued at \$55,467,657, in 1914.

The iron and steel industry in 1916 was even

crease of 66 per cent over that corresponding period for 1915, and the prices ranged from \$5 to \$7.25 per ton higher.

The production of iron ore in 1916, according to estimates made at the end of the year, was the greatest in the history of the iron mining industry. The shipments of iron ore from the mines during the year were about 75,500,000 gross tons, compared with 55,493,100 in 1915. This ore sold for \$178,935,000, an increase of over \$77,000,000 compared with 1915. The production of pig iron made a record in 1916, with a total of over 139,000,600 gross tons, compared with 29,190,213 tons in 1915. Of the total shipments of iron ore 64,734,198 gross tons were shipped by boat from the Lake Superior district. The shipments of iron ore from all other important iron mining districts showed increases ranging from 3.2 to 49 per cent. See also CHEMISTRY, INDUSTRIAL; FINANCIAL REVIEW: METALLURGY.

IRRIGATION. Largely on account of the

war the year 1916 was one of stagnation in the undertaking of new irrigation enterprises. In the Western Hemisphere both Canada and Mexico, the two countries having the most interest in the extension of irrigation, outside of the United States, were involved in war or revolutions, while in the Eastern Hemisphere most of the nations ordinarily engaged in reclamation work were also engaged in war. The progress of the year in different parts of the world is summarized below:

**UNITED STATES.** There was little new construction of irrigation works in the United States during 1916, such as there was being limited to work on United States reclamation projects and other projects previously begun, and a few comparatively small irrigation districts. The practical cessation of desert reclamation work led to a great deal of discussion of possible methods of financing reclamation and colonization schemes. The opinion was expressed very generally that the advance in the cost of irrigation works per acre served, had become so great that it would be necessary for future reclamation schemes to receive some form of public aid if they were to succeed, and that settlers on such land must be aided also. The extension of the time for payment of water-right charges under the government projects, provided for in 1915, was in effect a heavy subsidy, but it did not seem to be sufficient to enable persons with small capital to successfully take up land on the government projects. The reclamation fund created by existing law was about exhausted, and unless provision was made for increasing the fund in other ways new work under the reclamation service was practically at an end. Aside from government agencies, the "irrigation district" was receiving the most attention as a means of carrying on reclamation work. Under this plan lands susceptible of irrigation from a common system of works may be organized into a district which has power to issue bonds to obtain funds with which to purchase or construct the works necessary to provide a water supply for irrigation, and to levy and collect taxes to pay interest and principal on bonds and the cost of operation and maintenance.

Laws for the organization and operation of such districts had been in existence for many years and many districts had been organized, but these districts had not been successful in meeting their obligations, in all cases, and consequently there was little market for their bonds. Recent legislation and much proposed legislation had for its purpose the strengthening of the district scheme in order that bonds might be salable. Several of the Western States had made district bonds legal investments for certain classes of funds, and had provided for rigid State examination and supervision of plans for districts. The guaranteeing of district bonds by the State was being urged by many, and a bill was introduced in Congress providing for the guaranteeing of these bonds by the United States in cases where the plans were approved by the Secretary of the Interior and the works were built under his supervision. As a step in this direction Congress passed a law providing that government lands might be included in irrigation districts and become subject to district taxes, with the provision, however, that the taxes levied against such land

should not be paid by the United States, but should be charged against the land and be collected from the entryman when the lands were taken up.

Various plans for aiding settlers on irrigated lands were being urged but no definite policies had been clearly formulated. Government or State advances for equipment and stock with long periods for repayment and low rates of interest were being urged, but had not yet been provided for either by the States or the national government. A notable feature of the year was the turning over of the Imperial Valley (California) irrigation system to an irrigation district. This is the largest irrigation enterprise in the United States, comprising about 500,000 acres.

The annual report of the United States Reclamation Service for the year ended June 30, 1916, showed total estimated receipts from the sale of public lands credited to the reclamation fund, amounting to \$90,388,331.61, to which should be added a loan from the treasury of \$20,000,000, making the total reclamation fund \$110,388,331.61. Of this there had been expended up to June 30, 1916, \$102,151,456.07. The area included in the government projects on that date was 3,117,862 acres, to 1,690,244 acres of which the Service was prepared to furnish water for the season of 1916. The area covered by water-right applications and rental agreements—that is, the area for which the landholders had entered into agreements of some kind to pay water-right charges—was 1,307,810 acres, and the acreage to which water was supplied in 1916 was 856,778 acres, an increase of about 50,000 acres over the preceding year. The Service was prepared, therefore, to furnish water to 833,462 more than was irrigated, an area just about equal to that irrigated.

Under an order of the Secretary of the Interior, dated Nov. 22, 1915, the administration of the Reclamation Service was reorganized by reducing the number of members of the reclamation commission from five to three, the three retained being the director and chief engineer, the chief counsel, and the comptroller. The office of chief of construction was provided for, this officer having charge, under the director, of all construction and maintenance work, with headquarters in Denver. The board appointed in 1915 by the Secretary of the Interior to fix the costs of projects to be paid by the water users, has reported on a few of the projects.

Operations under the Carey Act (Act of Aug. 18, 1894, granting desert lands to the States on condition that the States provide for their reclamation), were small during the year 1916, as for several years previous. During the year ending June 30, 1916, there were applied for under this law areas aggregating 218,337 acres, and there was patented to settlers an area of 160,741 acres. The total area segregated to the States under this law since its passage, is 3,077,912.69 acres, and the total area patented to settlers is 761,455.30 acres.

Many State legislatures did not meet in 1916, and consequently there was no irrigation legislation. The act of Congress providing for the inclusion of government lands in irrigation districts has been mentioned.

**OTHER COUNTRIES.** Western Canada was in

much the same situation with reference to irrigation as was the United States. Water had been provided by the Canadian Pacific Railway for large areas not yet utilized, and the principal activity in irrigation was devoted to the settlement of this land. Efforts were made by settlers to be relieved from paying the portion of the purchase price of their lands representing the charge for irrigation, on the ground that the land did not need irrigation, but these efforts have not been successful.

Projects for the irrigation of large areas in Mexico were being urged, but the unstable conditions in that country prevented progress on these projects.

Notwithstanding the war there was considerable irrigation construction in progress in Italy, principally for storage of water. In Sardinia a dam 180 feet high was under construction. This dam was to create a reservoir with a capacity of 280,000 acre-feet. Another dam, in Apulia on the Bradano, was to be 200 feet high, and would provide for the storage of about 300,000 acre-feet; another dam, on the Fortore, was to be about 250 feet high and would provide a storage capacity of 300,000 acre-feet; and still another, on the Simeto in Sicily, would provide for the storage of 250,000 acre-feet. A large canal under construction near Grosseto, in Central Italy, on the Ombrone, had for its purpose the silting up of a large area of marsh land, and the irrigation of this land after it had been raised. The Italian government subsidized such works to an extent amounting to paying about 35 per cent of the cost, and it was proposed to increase the amount of such subsidies.

In the Canary Islands, the municipality of Santa Cruz, on the Island of Teneriffe, completed in August, 1916, an irrigation system comprising two long tunnels and a canal, for the watering of about 5000 acres of banana-bearing lands.

In South Africa, in the Sundays River district, near Port Elizabeth, it was proposed to erect a dam for storing water for the irrigation of 38,000 acres of land to be devoted to citrus fruits.

The Turkish government was proceeding with its plans for irrigation in Asiatic Turkey. In addition to its plans for irrigation from the Tigris and Euphrates rivers, begun a few years previously, it had undertaken a project for the irrigation of the Adana Plain, at a cost of nearly \$20,000,000, to serve nearly 500,000 acres of land which would be devoted to cotton, sugar cane, citrus fruits, and olives. This region is traversed by the Bagdad Railway and would have water transportation also.

The Egyptian ministry of public works, which had been experimenting with cotton in the Sudan for several years, issued a report favoring the storing of water on the White and the Blue Niles for cotton irrigation. Works were under construction, and it was considered possible to double the cotton acreage in Egypt.

The Siamese government entered upon the construction of the "Prasak" scheme of irrigation. This scheme involved the eventual reclamation of about 2,400,000 acres of waste land in lower Siam, for rice culture, at a total expense of some \$50,000,000. The plans, however, contemplated only the beginning of this

project. American engineers were in charge of the work and American machinery was being used in construction.

In Australia both Victoria and New South Wales were proceeding with their state irrigation projects and the settlement of the lands under them. See **AQUEDUCT; DAMS; FLOODS AND FLOOD PREVENTION.**

**ISOSTASY.** See **GEOLOGY, Isostasy.**

**ISTRIA.** A crownland of Austria, consisting of a peninsula in the Adriatic Sea and forming a part of the administrative district of Kärntenland. It contains the important naval base and seaport of Pola. The area is 1914 square miles; population in 1910, 403,566.

**ITALIAN LITERATURE.** In the 1914 **YEAR BOOK** we noted the Crocian movement in criticism and aesthetics as perhaps the solitary example of a marked Italian influence upon literary activities outside of Italy (Croce having a considerable following in Germany, England, and America), if we exclude the still fluid and inconsistent pressure of the Futurists. The **YEAR BOOK** has, since 1913, sought the explanation of this restricted popularity of Italian literature abroad in the special conditions of contemporary Italian culture which that literature reflects: nationalism (romantic historicity), regionalism, and Catholic idealism (sentimentality). Prof. Vittorio Racca in the *Colonnade* (New York, 1916) has written an interesting criticism of this point of view, breaking a lance in favor of Italian nationalism as a literary motive at once honorable and of universal appeal.

We regret our inability to range the name of Vilfredo Pareto, the Swiss-Italian economist, alongside of that of Benedetto Croce. There is little evidence that in the din of the war the sane and unbiased voice of Pareto is being heard. Pareto first came into prominence for his criticism of the century-old theory of the unequal distribution of wealth, pointing out the failure of political economy to have given any precise indication of what an "equal distribution of wealth" would be, going on thence to establish the law of wealth fluctuations and distribution. With an equally incisive thought he has attacked both the Marxian theory of war (economic interest) and the various official books of diplomatic records, exhausting the colors of the rainbow, which present the different national "justifications." If Pareto does not claim that the nations are fighting to actuate no real objects, he does hold that those objects are wrongfully stated, willfully confused. War is, for him, the result of national animosities sustained by national "myths and dogmas," which have an oratorical, a literary value, but are devoid of scientific, "experimental" worth. One of the most brilliant disciples of Pareto is Maffeo Pantaleoni, a visitor to America in 1913. We suggest Pantaleoni's article on the Monroe Doctrine, in the *Vita Italiana*, an important organ of youthful and vigorous Italian thought, as a typical specimen of Paretan criticism of international politics. This article is to appear in translation through the Carnegie Foundation. Those who recall the brilliant essay of Guglielmo Ferrero on *Poland, the Thorn in the Flesh of Germany*, written, we believe, as early as 1897, need find nothing new in Pareto's method, the novelty of which consists largely in stress and systematic development of certain principles of so-

ciology. Decidedly the war-book of the year has been the second edition of Preziosi's *La Germania alla conquista dell' Italia*, a work also of the Paretan tradition. It traces, through the directorships of the principal Italian financial houses, the growth of German power not only in Italy, but in Spain, South America, France, England, Russia, and the Orient, not through expenditure of German capital, but through control of local savings. Its character as an anti-neutrality pamphlet does not destroy the scientific value of this work, which is not without some interesting implications concerning American finance.

A dash of Pareto, a dose of Marinetti, mixed with a hatred of Hegel and Croce, a return to mysticism and reaction almost as rabid as the swing to socialism of 10 years ago, much conceit, some real sensibility, an insufferable brilliancy of epigram, an erudite misinformation, go to make up the present mental state of the most distinctive group of young litterateurs in Italy. The high priest of this group is still Giovanni Papini, the first Italian "pragmatist," one of the first "new nationalists," a later convert to futurism, now the inexhaustible, the tireless exponent of "the three greatest conquests of the contemporary spirit: pure lyricism, pure plasticism, pure speculation" (*La paga del sabato*, p. 200). Papini is convinced that Italy is the most intelligent nation in the world, and then, that Papini is the most intelligent man in Italy. He wastes much time proving, in nearly all his articles, this second thesis. For the rest, he writes little that does not contain at least some new idea, some penetrating reflection. His style is tense and furious, punctuated at points of special violence with little obscenities and oaths. "My mission on earth is, I believe, identical with that of the devil in the vast universe of the Lord God. I must deny, rebel, lead men to evil, hurl them into the hell of the unsatisfying particular, with contempt for the paradise of unity and order" (*L'altra metà*, p. 11). This group has many of the earmarks of the exaggerated romanticism of just a century ago. Like that ancient movement it is probably on the road to somewhere, without being fully conscious of its goal. Its organ is *La Voce*, where can be found from Soffici a development of the æsthetic theory of "wonderment" (*meraviglia*), samples of literary criticism (on Pascoli, for example, or Salvatore di Giacomo), specimens of poetry and romance. Or read the *Avventure spirituali* of Emilio Settemelli, or the *Prologhi* of Vincenzo Cardarelli, or the preface of De Robertis to the *Esame di coscienza di un letterato*, of Renato Serra, killed at Podgora in July, 1915. The arch-enemies of this school—but who in their blessedness hear not its chatter—are D'Annunzio and Croce. But are not these antitheses more imaginary than real? The exponents of pure lyricism may recall that Croce was the first to insist on the absolute distinction between logic (narrative, etc.) and intuition (lyricism). And the exponents of "wonderment" find their genealogy reaching back through the later aspects of D'Annunzio to the seventeenth century of Marino.

D'Annunzio, in whose ointment of the "sagra di Quarto" many a fly has become stuck since May, 1915, has published a beautiful symphony of patriotic, mystic, sentimental motivation in

the long *Licenza to La Leda senza oigno* (see YEAR BOOK, 1913), now appearing in three volumes. *L'Altare* of Sem Bennelli, "The Altar," is the "radiant vale of Vipacco, with its undulating hills, on which the people of Italy, in priestly garb, has sacrificed its sons to the Eternal Mother, to place the ring of Italy on the finger of Trieste" (pp. 4-5). Cesare Battisti, editor of *Tridentum* of Trent, was wounded and captured at Vallarsa, and hanged for treason in July. His last publication was a lecture entitled *Gli Alpini*. The works which exploit less directly or incidentally the war spirit, are legion. *Le spie* of Giuseppe Marcotti, for instance, harks back to Risorgimento days for some rather faded melodramatic effects of love and danger. Francesco Pastonchi has lost none of the exquisite delicacy with which years ago in *Fiamma* he clothed the wild passions of Sardinia. His *Campo di grano* suggests the healthy yearning for peaceful labor in the fat fields over which the war has swept in vain. The other tales in that collection enter preferably the traditional Italian spirit of sentimental gloom. *L'Amante lontano* of Roberto Bracco turns his favorite theme of feminine idealism into a similar channel: Mirrella is loved by Luciano and Michele; the heroic death of Luciano at the front renders her union with Michele forever impossible. A war hero figures also in Bracco's *Uocchie consacrate* (in Neapolitan dialect).

The volume of the fruitful poetic year is, as it was bound to be, some new *Poesie* of Salvatore di Giacomo (Ricciardi, Naples). After the death of the venerable interpreter of Sicily, Luigi Capuana, appeared his volume of tales *Dalla terra natale*, and a play *Quaquarè*. Keeping still to the authors of established fame, we note of Pirandello three comedies, *Ceodè*, *Pensaci Giacomino*, and *Se non così*; from Antonio Beltramelli, the regionalist of Romagna, *La sementa* (tales); from Luciano Zuccoli, *La volpe di Sparta*, and *Novelle prima della guerra*; from Grazia Deledda, *Le vie del male* (romance). The *Scampolo* of Dario Niccodemi is a rather hasty working of a theme of some potentiality: the wild, homeless, but honorable girl of the streets, coming under the awakening influence of adolescent love to a naïve vision of elegant life in a world far above her fortunes. Sabatino Lopez, the president of the Italian Authors' Association, has added to his dozen works for the theatre two comedies, *Per te solo* and *Mario e Maria*. There is some deep poetry in the work of an author who signs himself as Prince Ughetto di Cupi, entitled *Il postremo dolore, memorie del Marchese Marco di Roargo*. We indicate the *Ore calle? Sonetti romaneschi* of Augusto Sindici (Sinnici) to those who love the wonderful earnestness of *Villa gloria*, or the pathetic sparkle of *La scoperta dell' America* of Pascarella.

OTHER WORKS. *Verse*: G. Cena, *Homo*; C. Cordaro, *Canti di guerra*; E. Gerunzi, *Poemi del mistero*; M. de Leone, *Sonorita*; G. Ravegnani, *Io e il mio cuore*; G. Martini, *Il fanciullo che cade*, and *La vipera*; E. Pettinelli, *Il magistrato* (prize winning comedy, Rome); Viola-Antonelli, *L'ombra*; G. Antona-Traversi, *Il sopravissuto*; A. Novelli, *Pollo freddo and Il lupo eretico il vizio*; A. Ricchetti, *N. H. Kan-Kan*; Enrica B. Gentilli, *Mio zerman*; G. M. Sierra, *La canzone della cuna*.

**NECROLOGY.** Ferruccio Benini, actor, interpreter of Goldoni and Gallina; Giuseppe Pitré, Sicilian folklorist; Bonaventura Zumbini, critic and scholar; Ugo Bolzani, historian, medievalist; Domenico Gnoli, critic, littérateur; Tommaso Salvini, famous tragic actor.

**ITALIAN PHILOLOGY. See PHILOLOGY, MODERN.**

**ITALIAN SOMALILAND.** An Italian colony in eastern Africa, bordering the coast of the Indian Ocean. Estimated area, 357,000 square kilometers (about 137,800 square miles). Estimated population, 300,000. In 1914-15, imports were valued at 7,166,329 lire, and exports at 1,611,318. For 1915-16 the estimated revenue was 6,669,000 lire; estimated expenditure, 6,569,190 lire. The dependency is administered by a governor, resident at Mogadiscio.

**ITALY.** A southern European constitutional monarchy, composed of the Apennine Peninsula, the islands of Sicily and Sardinia, and a number of minor islands. The peninsula is traversed throughout its length by the Apennine chain; the Alps divide it from France on the north. Italy is a member of the Entente Alliance in the European war. Capital, Rome.

**AREA AND POPULATION.** In the following table are given, by compartimenti, the area in square kilometers (according to the calculation of the Military Geographical Institute), the number of provinces in each compartimento, the population as taken at the census of June 10, 1911, and the population as estimated Jan. 1, 1915:

	P.	Sq. km.	1911	1915
Piedmont .....	4	29,367	3,424,450	3,508,626
Liguria .....	2	5,278	1,197,281	1,269,506
Lombardy .....	8	24,085	4,790,478	4,996,325
Venetia .....	8	24,547	3,527,860	3,732,941
Emilia .....	8	20,701	2,681,201	2,809,187
Tuscany .....	8	24,105	2,694,706	2,787,765
The Marches .....	4	9,712	1,093,253	1,133,265
Umbria .....	1	9,709	686,596	714,682
Rome .....	1	12,081	1,802,424	1,887,846

Calabria .....	3	15,075	1,402,151	1,471,780
Sicily .....	7	25,789	3,672,258	3,793,465
Sardinia .....	2	24,109	852,407	880,868
<b>Total .....</b>	<b>69</b>	<b>*286,682</b>	<b>34,671,337</b>	<b>36,120,118</b>

\* 110,688 square miles.

The communal population of Naples, as estimated Jan. 1, 1915, was 697,917, Milan 663,059, Rome 590,960, Turin 451,994, Palermo 345,891, Genoa 300,139, Florence 242,147, Catania 217,389, Bologna 189,770, Venice 168,038, Messina 150,000, Leghorn 108,585, Bari 109,218, Padua 105,135, Ferrara 102,550, Brescia 89,622, Verona 86,448, Foggia 79,213, Ravenna 74,161, Modena 76,584, Perugia 70,227, Pisa 67,285.

The number of marriages in 1914 was 252,187; living births, 1,114,091; stillbirths, 47,615; deaths exclusive of stillbirths, 643,355. Emigrants in 1914 numbered 479,041, of whom 233,144 went overseas and 245,897 to the European countries or other countries on the Mediterranean.

**INDUSTRIES.** Of the total area (about 70,800,000 acres), about 51,300,000 acres are classed as productive and over 11,200,000 are forested. The rich soil yields fruits in abundance. Wine is produced in quantities for consumption and export. From Tuscany, Liguria, and the Province of Bari comes olive oil. In the table below are to be found area under main crops and production, for consecutive years:

	1000 acres		1000 cwts.	
	1914	1915	1914	1915
Wheat .....	11,921	12,649	92,230	92,825
Barley .....	617	615	3,012	4,812
Oats .....	1,228	1,222	7,788	9,128
Rye .....	306	298	2,672	2,216
Corn .....	3,934	3,933	53,346	61,860
Rice .....	365	360	10,894	11,212
Beans .....	1,584	1,352	6,402	9,498
Potatoes .....	735	734	1,668	1,545
Sugar beets .....	102	125	1,350	1,480
Vines .....	11,803	11,041	947	419
Olives .....	5,746	5,750	39	88

Sericulture is carried on throughout the country, particularly in Piedmont and Lombardy. The quantity of eggs placed for hatching in 1913 was 300,000 hectograms, producing 32,000,000 kilograms of cocoons. The production for 1914 was 46,668,000 kilograms.

Among the principal minerals are iron, lead, zinc, copper, manganese, and antimony ores, sulphur, gypsum, amianthus, alum, and boracic acid. Silver is found in Sardinia, and some gold in the Alps. Salt is a government monopoly. Following are the productive mines in operation and the output in metric tons in 1914, the value in lire of the output, and the number of workers:

Ores, etc.	No.	M. tons	Ltrs	Workers
Iron	25	706,246	16,227,168	2,059
Manganese	6	1,649	54,721	158
Copper	7	86,958	1,648,608	888
Zinc	97	48,538	9,114,859	14,006,171
Lead

Asphaltic and bituminous substances	19	120,179	2,188,588	1,142
Boric acid	7	2,587	1,040,170	501
<b>Total *</b>	<b>605</b>		<b>96,517,918</b>	<b>44,165</b>

\* Including other.

Employed in the quarries in 1914 were 67,818 persons, and the output was valued at 81,277,096 lire.

In the fishing industry, 28,820 boats, with a tonnage of 79,915, were employed Dec. 31, 1913; persons engaged, 141,371; value of total catch in home waters, 19,939,000 lire, of which 2,397,000 lire from the tunny fisheries and 535,000 from coral fisheries.

COMMERCE. A decree of Nov. 13, 1914, provided that merchandise, the exportation of which is prohibited, cannot be re-exported to foreign countries in process of transit or transshipment if it has arrived in an Italian port with bills of lading indicating Italy as the original destination, or if there is no clear indication of destination. For this purpose, consignments provided with bills of lading to order not having inscribed in the body of the document the name of a non-Italian destination, and those provided only with bills of lading to bearer, will be considered as destined for consumption in Italy. By decree of June 10, 1915, the export of all foodstuffs was prohibited. By decree of Sept. 2, 1915, raw cotton was declared contraband of war. The decree of Sept. 15, 1915, introduced an export tax for rice and other cereals in special cases, where the export is permitted (by the decree of Aug. 1, 1914). The imports for consumption and exports of domestic produce—merchandise, and coin and bullion—are given below for three years (values in lire):

Imports	1909	1911	1913
Mdse.	3,111,710,447	3,889,298,000	3,637,771,000

\* With Ceylon.

COMMUNICATIONS. For the financial year 1914-15 the Italian treasury was compelled to make up a deficiency of approximately \$4,000,000 in the net receipts of the state railways. This covers a period before Italy entered the war, but her railways were affected by the reduced commerce, and by the high prices of coal and material, as well as by the suspension of navigation in the Adriatic, and the absence of tourists. Railroad freight rates in Italy during 1916 were raised 10 per cent so as to secure money to pay extra wages of the railway employees, totaling \$4,000,000, which were granted after complaints of the high cost of living and the extra work entailed by reason of the war. It was hoped the government revenues would be increased by \$3,000,000 annually.

FINANCE. Revenue and expenditure are given in lire in the table below for three financial years (1914-15 subject to revision):

	1912-13	1913-14	1914-15
Revenue	3,252,073,913	3,160,230,044	2,843,544,078
Expend.	3,248,739,972	3,129,228,156	2,863,218,485

The budget for 1915-16 is detailed below:

Revenue	1000 lrs	Expend.	1000 lrs
Real property	15,817	Treasury	712,668
Railways	25,260	Finance	358,084
Land tax	90,325	Justice	58,833
Income tax	380,700	Foreign affairs	15,616
House tax	127,770	Instruction	176,292
Succession duties	66,950	Interior	185,848
Registration	107,500	Public works	68,276
Stamps	94,490	Posts and Tels.	148,407

Surplus	38,745	Agriculture, etc.	9,747
Loans	201,467	Colonies	94,858
Total extraordinary	307,477	Total extraordinary	590,282
Grand total	3,007,027	Grand total	2,960,545

Capital of the debt, June 30, 1915: 9,922,420,-633 lire consolidated debt; redeemable, 4,640,-247,111; permanent, 64,179,773; tribute to the Holy See, 64,500,000; treasury obligations, 1,236,-370,000; floating debt, 3,062,436,330—total, 18,-990,154,847.

**ARMY.** Unlike the other European Powers, Italy had ample notice of what would be required should she enter the conflict, and from August, 1914, to May, 1915, there was opportunity for preparation. At the outbreak of the war there had been mobilized: 94 regiments of infantry, grouped in 48 brigades, 25 divisions, 12 army corps, 2 regiments of grenadiers, 12 regiments of Bersaglieri (each of which had 1 battalion of cyclists), 8 regiments of Alpine troops, 36 regiments of field artillery, 2 regiments of heavy artillery, 2 regiments of mountain artillery, 10 regiments of siege artillery, 29 regiments of cavalry, 6 regiments of engineers, 1 battalion of technical arms, and 1 battalion of aviators. Naturally these forces were augmented gradually as the war developed, while the organization of supply and transportation was such as to elicit admiration from neutral observers. The supreme command of the army was vested in the King, who went to the front on the declaration of war; his chief of staff was Gen. Luigi Cadorna, and his assistant chief of staff, General Porro. In the infantry the term of service prior to the war was two years, and while the recruit was less developed than in other nations, he was trained assiduously, and even the southern soldiers became acclimated to the winter rigors of the high Alps. The troops of this arm seemed to have performed better in the war than was expected of their general reputation. All arms wear a gray-green uniform. The foot soldier is equipped with a knapsack, breadsack, wooden water bottle, cartridge box with 90 cartridges, cooking tin, shelter tent, and two pairs of shoes. After the élite or first line, the territorials, 32 to 39 years of age, were mobilized, and being fathers of families they were used in the supply service, though a number of battalions were in action and acquitted themselves admirably, having resistance and perseverance that more than compensated for any lack of dash of the younger troops. The Bersaglieri, while equipped and trained for fighting in low or rolling country, adapted themselves to the mountain warfare of the great struggle. The Alpini, who were recruited in the Alpine zones and had spent their two years of service entirely in the Alps, also proved distinctly useful in the field for which they had been trained. The mountain artillery found constant use against enemy camps on the heights, surprising groups forming in the valley, and against supply columns. In the trenches the mountain artillery was said to have been less effective, though it often was used to destroy barbed-wire entanglements. The field artillery at the outbreak of the war was armed with Krupp guns, transporting 250,000 soldiers and refugees in

but many batteries were being supplied with an improved deport gun with a split trail which permitted of high elevation and placing on slopes. The heavy artillery of Italy, good at the beginning, developed as hostilities progressed. There was considerable opportunity for brilliant military engineering in the way of constructing mountain and other roads and the transport of artillery to all but inaccessible positions. As in other European fields, the cavalry had but little opportunity for action, and many of its members were transferred into other branches. A Swiss military observer, who had an opportunity to see the Italian army at the front, wrote in the *Revue Militaire Suisse*: "The Italian army does not seem the least exhausted after seven months of war. In Italy the number of robust men who have not yet been mobilized is striking. The war has been conducted on enemy territory and Italy preserved from the horrors of war. Civil life goes on without apparent interruption. The operations have been so scientifically and prudently conducted that the army has great confidence in its commanders."

**NAVY.** See NAVAL PROGRESS.

**GOVERNMENT.** Previous to 1870 Italy was composed of the various states of Sardinia, the two Sicilies, the Pontifical States, the Lombardo-Venetian provinces of the Austrian Empire, the Grand Duchy of Tuscany, and the duchies of Parma and Modena. In 1870 the unity of the country was finally effected and Rome became again the capital of Italy, which is now divided for administration into provinces. The constitution vests the executive authority in the King, acting through a responsible council of 11 ministers. The legislative authority is vested conjointly in the King and a Parliament composed of a Senate (318 members) and a Chamber of Deputies (508 members). The King is required to convoke the Parliament annually, but may dissolve it at will. Reigning sovereign, Victor Emmanuel III, born Nov. 11, 1869; he succeeded his father July 29, 1900, and married, Oct. 24, 1896, Princess Elena of Montenegro. The heir-apparent is Prince Humbert, born Sept. 15, 1904. There are four other children, all daughters.

#### HISTORY

**THE MINISTRY.** The Salandra ministry was severely criticised during the year. In March the attacks became so serious that a crisis was narrowly averted. The Opposition accused the government of laxity in the conduct of the war, and said that unless they could be assured of greater energy in the future, they would refuse to support it. The ministry, however, after assuring Parliament that measures had been taken for preventing the repetition of past mistakes, succeeded in avoiding the crisis. In April, Baron Sonnino, in a speech reviewing the situation, said that Epirus had been occupied only for the time being and without any view of conquest, and that the admission of deputies from Epirus to the Greek Chamber was in accordance with the principles agreed upon at the London Conference of Ambassadors in regard to Albania. He assured Parliament that the Italians would help Serbia. He pointed to the efficient work of the Italian government in

spite of the many submarine attacks and the dangers from mines and from airships. As to the charge that the Austrians were maltreating Italian prisoners in Austria, he said that they had been visited by the American ambassador and Red Cross representatives and that no evidence of ill-usage had appeared. The Chamber of Deputies gave the government a vote of confidence on April 16th of 352 to 36. The attacks on the cabinet continued, however. One of the especial grievances charged by the Interventionists, whose leader was Bissolati, was the lack of frankness on the part of the cabinet which, they said, was designed to cover mistakes in the direction of the war. They insisted on a closer relation between the cabinet and Parliament. After the Italian reverses on the Isonzo, the cabinet crisis could no longer be avoided, and the Salandra ministry resigned on June 10th, having failed to receive from the Chamber of Deputies a vote of confidence on the budget of the ministry of the interior. The vote against the government stood at 193 against 141, and the prevailing element in the majority was the Interventionists, who consisted of 35 Radicals, 25 Republicans, 20 Reformist-Socialists, and 20 Democrats, also the Nationalists and a few others. Signor Boselli (q.v.), dean of the Chamber of Deputies, was chosen to form a new cabinet, on a national basis, which would be satisfactory to the different parties. This cabinet was announced on June 19th, with Signor Boselli as Prime Minister. Baron Sonnino was retained as Foreign Minister. Other important members of the new cabinet were Bissolati, who was a minister without a portfolio, and Orlando, Minister of Justice in the former cabinet, and now Minister of the Interior. Signor Bissolati was one of the Reformist-Socialists who had distinguished himself at the close of 1915 by declaring that "a vote against the ministry is a vote against the war." The ministry was described as purely national, for it comprised men of all parties and shades of belief. The Prime Minister himself and four of his colleagues were Liberal Conservatives. Besides Bissolati, the Reformist-Socialist, and Signor Orlando, who with three other ministers were Liberal Democrats, there were two Radical members, a Republican and a Roman Catholic. A feature that attracted much attention was this inclusion in the cabinet for the first time of a Roman Catholic, Signor Meda, in the department of finance, who was reported to be regarded with much sympathy by the Vatican, but it was officially explained in the Catholic press that he did not represent Catholic organizations and that he did not compromise the neutrality of the Holy See in Parliament. Signor Meda had strongly supported the Salandra cabinet. Another departure was the introduction of a representative of commerce in the ministry. In the Premier's announcement, he emphasized Italy's fidelity to the Entente, foreshadowed measures for the reduction of luxuries and the restriction of consumption of alcohol, and declared his faith in ultimate victory. In the vote of confidence that followed the government had a strong majority, the only serious opposition coming from the extreme Socialists who cast 44 votes against it.

**WAR MEASURES.** While trade with Austria-Hungary was prohibited on the declaration of war, May 23, 1915, trade with Germany was not formally prohibited till Feb. 11, 1916, when

a royal decree forbade exportation, importation, and transit through Italy of any German or Austrian products. The Cabinet Council on February 16th decreed that free trade with the Allied countries would be applied during the next five years to all machinery, raw materials, and manufactures necessary for the development of home industries. Subscriptions for the third war loan began on January 10th. Down to the close of February German ships had been interned in Italian ports, but on February 29th it was announced that 34 of them would be seized.

**DALMATIAN ASPIRATIONS.** The part played by the Italian desire to regain Dalmatia was the subject of continued discussion in 1916. It will be remembered that when von Bülow left Italy he publicly attributed the check in the negotiations to Italian agitation of the Dalmatian question. An important league was formed for this purpose. It was dominated by the democratic party and its committee of control comprised the majority of the radical and even of the clerical deputies. The president of the league, the Duke de Cesaro, set forth the Italian argument as follows: "Dalmatia," said he, "belongs to Italy by right and by necessity." The west coast of the Adriatic is almost indefensible, Italy having only two ports, one at the north, Venice, and the other at the south, Brindisi. On the other hand, the eastern coast is wonderfully well protected by a network of islands and is indented at frequent intervals. A fleet could coast along the entire shore, under this protection, without danger and submarines could take shelter there. Mines placed along the Dalmatian shore are carried by the current beyond the western coast. A nation is in a very serious situation when it finds itself obliged to shut up its fleet in an inland sea. Moreover, Dalmatia has been united with Italy by a long historic past and is now united as well by economic and industrial conditions. Dalmatia owes its modern civilization to the Venetian Republic. Its art and literature bear marks of Latin influence. To-day, Dalmatian industry is Italian. Factories, mines, quarries, electric plants, in short the best part of the industry of Dalmatia is in the hands of Italian companies—the engineers, the capital, and the manual labor being all Italian. The Italians did not, he said, claim the sole control over the Adriatic. They acceded to Serbia's demand for an opening on the sea, and admitted the legitimate right of the Slavic population to 200 or 300 miles of the coast. But the latter, who numbered only a million, would never become powerful enough to close the Adriatic to Austria and Germany. "That task," said the Duke de Cesaro, "belongs to Italy."

**ITALY AND HER ALLIES.** Toward the end of the year there was some doubt as to Italy's willingness to aid the Entente Allies in the East. It was thought that if the Germans should make an attack upon the forces under General Sarrail, the troops in that quarter would find themselves in a serious situation, and that Italy's aid would be necessary. A declaration by the Italian Prime Minister, Signor Boselli, tended to remove apprehension on the subject. He said by sending a contingent of her troops to take part in the campaign at Saloniki, Italy had conformed to her agreement as to perfect unity of action with her Allies. Italians had extended in the same manner to Rumania the

brotherly aid that it was in their power to give, and at the same time by this expedition Italy had shown and confirmed her decision to be always at hand at the development and the solution of the Balkan and Mediterranean problems in accordance with her own vital political and economic interests which were directly involved in the military events in that quarter. See **WAR OF THE NATIONS, Italy and the Entente, and Military Operations.**

**OTHER EVENTS.** Early in the year 25 Italian soldiers landed at Corfu, and this was supposed to indicate the beginning of a movement to aid the Allies. A deputy in the Greek Chamber immediately protested against this act. Meanwhile, Italy had decided to abandon Durazzo, which the Austrians were threatening, and transfer the troops from that point to Vallona. On May 16th the importation of luxuries and of articles not of the first necessity was prohibited, in order to facilitate freighting to the government. The embargo was to go into effect from June 4th, and included such articles as mineral waters, spirits, manufactured tobacco, woolen carpets, furniture, automobiles, etc. The government issued a decree in July rendering subjects of Austria-Hungary's allies liable to internment and to sequestration of property. In January the new Dutch minister presented himself at the Vatican. There was continued talk of Papal mediation on behalf of peace, and the rumors were revived on many occasions during the year, for example, at the conference of the Belgian Cardinal, Mercier, with the Pope in January and at the audience granted by the Pope to Premier Pashitch of Serbia, March 17th, and to Premier Asquith on April 1st. See **ARCHÆOLOGY.**

**IVANOV, NICHOLAS J.** See **WAR OF THE NATIONS.**

**IVORY COAST.** One of the colonies composing the government-general of French West Africa. The capital is Bingerville, with 78 European and 780 native inhabitants. The principal products for export are mahogany and other woods, palm kernels and oil, rubber, manioc, and ground nuts. See **FRENCH WEST AFRICA** for area, population, etc.

**I. W. W.** See **INDUSTRIAL WORKERS OF THE WORLD.**

**JACKSON, GEORGE THOMAS.** An American dermatologist, died in New York City Jan. 3, 1916. Born in New York in 1852, and educated at the City College there, he returned, after two years in foreign universities, to take his medical degree at the College of Physicians and Surgeons (Columbia) in 1878. With this latter institution he was long connected (1890-1913) as instructor and professor of dermatology, although during part of the same period he held chairs in the Woman's Medical College of the New York Infirmary and in the University of Vermont. Dr. Jackson published *A Practical Treatise on Diseases of Hair and Scalp* (1887, 1894); *Ready Reference Handbook of Diseases of the Skin* (1892; 7th ed., 1914); and, with C. W. McMurtry, *Treatise on Diseases of the Hair* (1912).

**JACOBS, JOSEPH.** A Jewish scholar, died in Yonkers, N. Y., Jan. 30, 1916. He had been in the United States since 1900, when he came to New York to serve as an editor of the *Jewish Encyclopædia*. Dr. Jacobs was born at Sydney, New South Wales, in 1854, and graduated from

St. John's College, Cambridge, in 1876. He devoted himself especially to the study of the history of ancient and modern Judaism, a field in which he became an authority. He was a founder, and president in 1898-99, of the Jewish Historical Society of England; secretary of the Russo-Jewish Committee; and had served as editor of the *Jewish Year Book* (1896-99), and of the *Literary Year Book* (1898-99). As editor, for some years, of the journal *Folklore*, he came to be recognized for his researches into the migration of fables and mythology from race to race, and he was almost as well known as a writer of fairy tales as Andrew Lang. After coming to the United States, Dr. Jacobs served as professor of English literature and rhetoric in the Jewish Theological Seminary of America, from 1906 to 1913, and as editor of the *American Hebrew*. He devoted much time to a sociological and statistical study of the Jews in England, America, and other parts of the world. Besides the literary work mentioned, and the editing of French and English classics, he published a life of Jesus from a Jewish point of view (*As Others Saw Him*, 1895); several volumes of English and Celtic fairy tales; *Studies in Jewish Statistics* (1890); *The Jews of Angevin England* (1893); *Literary Studies* (1895); *Jewish Ideals* (1896); etc.

**JAMAICA.** An island in the Caribbean Sea; the largest of the British West Indies; a crown colony with dependencies as follows: Turks and Caicos Islands, Cayman Islands, Morant Cays, and Pedro Cays. Area of Jamaica, 4297 square miles. Population, 831,383 (15,605 white, 163,201 colored, 630,181 black, 22,396 East Indian). Kingston (57,379 inhabitants in 1911) is the capital. Area under sugar cane (1914-15), 31,727 acres; under coffee, 18,175; under bananas, 85,854. Imports (1914), £2,565,820; exports, £2,904,533. Railway, 197 miles. Revenue (1914-15), £1,170,618; expenditure, £1,235,667. Debt (March 31, 1915), £3,893,577.

**JAMES, HENRY.** A novelist of American birth, who lived abroad most of his life and before his death became a British subject, died at his London home Feb. 28, 1916. He had been ill for some months, and doubtless his end was hastened by the intense interest and the energy he gave to the British cause after the outbreak of the European war; this, combined with his activity as chairman of the American Motor Ambulance Corps in France. The renunciation of his American citizenship in July, 1915, indicated mainly his desire to bind himself more closely to his many English friends in a time of national crisis, but it expressed also his distress that the United States had not championed the cause of the Allies. His funeral was held from Chelsea Old Church, and his body was cremated.

Henry James, in the forefront of the novelists of his day, and apparently assured of a permanent place in English literature, was born in New York City April 15, 1843. He was the son of a noted Swedenborgian theological writer and socialist, for whom he was named. His grandfather, William James, was a Scotch-Irishman who migrated to America and made a fortune out of Syracuse salt wells. This fortune supplied 11 children and their descendants so amply that means of livelihood were never in question. The grandfather's namesake, Henry's brother, became the famous psychologist and philosopher. The family early went abroad, and the boys were

educated in private schools and German universities, with liberal interlardings of travel and association with intellectual people. For an account of this period, two of the last books Henry James wrote should be consulted: *A Small Boy and Others* (1913) and *Notes of a Son and Brother* (1914).

At 19 James returned to the United States to enter Harvard Law School. He finished the course and was admitted to the bar, but never devoted himself to practice. In fact, while still studying, he had done considerable writing. His first story to appear, *The Story of a Year*, was published in the *Atlantic Monthly* in 1865. This and other sketches that followed were precocious rather than promising, and much of his early work James himself later preferred to ignore. He made a circle of friends in Boston and Cambridge who always remained his admirers, although after 1869 his periods of residence in this country were really but visits. First France and Italy attracted him: in the languages and literature of these countries he steeped himself. By 1880 he had settled in England, where, although he had a London residence, he cared most for the ancient dwelling (Lamb House) that he took at Rye, Sussex. He was never married.

Through the most acute and intensive observation of manners and character as he found them, especially in the cultured and wealthy circles in which he moved, Henry James built up the fund of material that served him in novel after novel. Particularly did he find in the American, provincial American, tourist in Europe an excellent foil to the continental European and his regard for convention—as appears in *The American* (1877) and *Daisy Miller* (1878). The second of these books, which created a sensation, is the only one that ever reached more than a small circle of readers. To James's devotees, however, on this side of the water and the other (in England they were known as the Jamesites), each new volume was an event. At first direct in treatment, simple and clear in style, fashioned on French models, his writings became more and more obscure, involved, and indeterminate, a maze of words and thoughts. Distinguished though he was as a theorist in the art of the novel, possessed of the highest technical skill, and a master of psychological analysis, James allowed himself to carry to an extremity his idea that fiction should be a cross-section of life, full of raw edges and loose ends. For the plot that could be done up in a neat parcel he had no use. That despite his eccentricity and barrenness of humanizing qualities, Henry James bulks so large among the men of letters of his time, is a tribute to the distinction that sets him apart from the crowd. Yet the popular novelist who turned out two volumes a year regularly might well envy his productiveness. The amount of writing, carefully pondered and polished, that he produced is enormous. Never pushed by necessity, and possessed of many social interests, he yet confined himself in a most methodical way to his work.

*Watch and Ward*, published in 1871, was his first novel. It was followed by *A Passionate Pilgrim* in 1875; but *Roderick Hudson*, which also came out in the latter year, was the earliest that the author stamped with final approval. Except for a long period of inactivity (1890-96),

it was an exceptional year that did not bring at least one volume from Henry James's pen. There were some 40 in all. *The American* and *Daisy Miller* have been mentioned as two of his chief works of fiction. Others that stand among the more notable include: *Washington Square* (1880); *The Portrait of a Lady* (1881); *Princess Casamassima* and *The Bostonians* (both 1886); *The Tragic Muse* (1890); *What Maisie Knew* (1897); *The Sacred Fount* (1901); *The Wings of the Dove* (1902); *The Ambassador* (1903), which best satisfied its author; and *The Golden Bowl* (1904). From time to time appeared also collections of short stories, such as *A Bundle of Letters* (1879), and various critical works. Of the latter, probably the most important are *French Poets and Novelists* (1878), a subject that he was eminently fitted to treat; *Nathaniel Hawthorne* (1880), for the "English Men of Letters Series"; and *Partial Portraits* (1888). *The Question of Our Speech* and *The Lesson of Balzac* were lectures, published in 1905. Among books directly the fruit of his travels may be mentioned *Portraits of Places* and *A Little Tour in France* (both 1884), *English Hours* (1905), and *Italian Hours* (1909). A collected and selected edition of *Novels and Tales*, in 24 volumes, appeared in 1909. In the latter year also was published one of a small group of plays—*The High Bid*, produced by Forbes Robertson. As early as 1895 his *Guy Domville*, of uneven merit, but notable for one scene, was presented at the St. James's Theatre, London.

Mr. James died full of honors. On New Year's day, 1916, not two months before his death, he received from King George V that coveted badge of distinction, the Order of Merit. A few years earlier, his 70th birthday was made the occasion of a remarkable tribute from 250 of his British friends, among them John Singer Sargent, who asked him to sit to that painter for his portrait. This likeness has been willed to the National Portrait Gallery. In the country of his birth, which is said to have been always of more interest to him than his voluntary expatriation might indicate, he was early chosen a member of the American Academy of Arts and Letters, and Harvard University conferred on him the degree of Doctor of Letters. A tribute that James probably cared little about was the growth of a large critical literature that was scarcely able to keep pace with his writing. The flattery of imitation could not touch him, and it is said that he was none too gentle with his practicing disciples; yet among his literary followers are to be counted several of the more notable American women writers—Edith Wharton, Anne Douglas Sedgwick, Katharine Fullerton Gerould, and Ellen Glasgow. In 1916 both Rebecca West and Ford Maddox Hueffer published books (the former containing bibliography) on Henry James.

**JAMES, THOMAS LEMUEL.** An American public administrator and banker, died in New York, Sept. 11, 1916. He was born in Utica, N. Y., in 1831. After an education at Utica Academy, he entered a printing office. For 10 years, from 1851, when with Francis B. Fisher he bought the *Madison County Journal* of Hamilton, N. Y., he was a newspaper editor. From 1861 to 1873 Mr. James was identified with the New York customs service, rising to be deputy collector. This he left to accept the postmaster-

ship of New York, offered him by President Grant, and to which he was reappointed by President Hayes. The remarkable improvement which he brought about in the city's mail service, and in the handling of foreign mail, gained him attention abroad as well as in this country, and when the office of Postmaster General became vacant the President wished to appoint Mr. James. For the sake of his work in New York he declined this offer, as well as that of the Republican mayoralty nomination. However, during 10 months in 1881-82 he did occupy the office of Postmaster General, accomplishing notable reforms, including retrenchments that made possible two-cent letter postage. He resigned after the death of President Garfield, when Arthur reorganized the Cabinet. Thereafter until his retirement a few years ago, Mr. James had been president of the Lincoln National Bank of New York, and at his death he was chairman of the board of directors of the Lincoln Safe Deposit Company.

**JAMMES, FRANCIS.** See FRENCH LITERATURE, *Poetry*.

**JAPAN.** An empire of the Far East. The capital is Tokyo.

**AREA AND POPULATION.** Japan consists of four large and many small islands, with a total area of 147,657 square miles. The large islands are: Honshiu, 86,305 square miles; Kiushiu, 13,768; Shikoku, 6856; Hokkaido, 30,144. Honshiu, called also Hondo and the mainland, has about three-fourths of the population. At the end of 1913, the legal population, as officially stated, was 53,362,682, compared with 49,588,804 in 1908 and 46,732,876 in 1903. Japanese residing abroad, Dec. 31, 1913, 335,171, of whom 107,704 in China, 88,526 in Hawaii, 77,736 in the United States, 12,253 in Canada, 11,893 in Brazil, 6661 in Australia, 5166 in the Straits Settlements, 4894 in the Philippines, 4858 in Peru, and 2737 in Mexico. Foreigners resident in Japan on the same date, 19,012, of whom 11,905 Chinese, 2827 British, 1733 Americans, 951 Germans, 554 French, and 219 Portuguese. The indigenous inhabitants (Ainos) of Hokkaido numbered 18,727 at the end of 1913 and 18,347 at the end of 1914.

The number of marriages in 1911 was 434,538, and the annual average for 1902-11, 408,059; divorces, 58,302 and 61,825; living births, 1,763,639 and 1,579,782; stillbirths, 155,319 and 154,628; deaths, 1,053,460 and 1,019,134; marriage rate per thousand inhabitants, 8.40 and 8.37; divorce rate, 1.13 and 1.27; living birth rate, 34.1 and 32.4; of living births, the number of boys per 100 girls, 103.98 and 104.60; percentage of stillbirths, 8.09 and 8.95; death rate, 20.4 and 20.9.

Resident population of the larger cities as reported for Dec. 31, 1913: Tokyo, 2,050,126; Osaka, 1,395,823; Kyoto, 509,380; Nagoya, 452,043; Kobe, 442,167; Yokohama, 397,574; Hiroshima, 167,130; Nagasaki, 161,174; Kanazawa, 129,804; Kuré, 128,342; Sendai, 104,141; Hakodate, 99,795; Fukuoka, 97,303; Sapporo, 96,924; Saseho, 94,914; Otaru, 92,864; Okayama, 86,961; Yokosuka, 85,473; Wakayama, 77,683; Kago-shima, 75,907; Shimonoseki, 72,117; Moji, 71,977; Tokushima, 70,292; Kumamoto, 68,167; Sakai, 67,706; Niigata, 66,622; Toyama, 64,822; Shizuoka, 64,108; Fukui, 56,218; Nawa, 55,547; Toyohashi, 54,673; Utsunomiya, 54,049; Kofu, 53,872; Gifu, 51,647; Maebashi, 50,061.

The dependencies of Japan are Korea (Chosen), Formosa (Taiwan), Karafuto (the southern part of the island of Sakhalin), Kwantung (a leasehold in southern Manchuria), and the Pescadores (Hokoto); total, 112,371 square miles, with an estimated population of about 19,700,000.

**EDUCATION.** The school system is well organized and efficient. Primary instruction is compulsory between the ages of 6 and 14. As reported for the school year 1913-14, public primary schools numbered 25,615, with 157,285 teachers (113,806 male, 43,479 female) and 7,095,755 pupils (3,802,653 male, 3,293,102 female). Secondary schools for boys numbered 318, with 6276 teachers and 131,946 students; superior schools for girls, 330, with 4117 teachers (of whom 1781 male) and 83,287 students. The number of normal schools was 86, with 1623 teachers and 27,928 students (of whom 19,023 male); superior normal schools, 4, with 222 teachers and 1766 students (of whom 1077 male). At special and technical schools there were 496,031 students. The four imperial universities had 9572 students: Tokyo, 5233; Kyoto, 1791; the Northeast, 1951; and Kiushiu, 597.

**AGRICULTURE.** The leading crop is rice, to which were planted in 1914 3,033,369 cho, yielding 57,006,000 koku (1 cho = 2.45 acres; 1 koku = 4963 bushels). To wheat were planted in 1914, 479,001 cho, yielding 4,488,000 koku; barley, 616,314 cho, 9,549,000 koku; rye, 727,900 cho, 7,207,000 koku. Other important crops are peas, beans, millet, colza, potatoes, and tea. The table below shows area in hectares and yield in thousands of metric quintals in 1915 and 1916, together with the yield per hectare in 1915 (the figures for 1916 are subject to revision):

	Hectares		1000 qs.		Qs. ha.
	1915	1916	1915	1916	
Rice	3,060,510	3,052,538	79,708	80,338	26.0
Wheat	505,823	518,985	7,021	6,653	13.9
Barley	1,310,685	1,258,258	21,960	21,738	16.8
Oats	65,622	62,681	1,026	.....	15.6
Corn	58,304	63,620	952	1,042	16.3
Potatoes	78,662	93,583	6,825	10,616	86.8
Flax	16,364	18,446	* 78	.....	3.8
Tobacco	80,546	29,280	480	510	15.7

\* Flaxseed, 77,760 quintals; fibre, 62,675 quintals.

Live stock at the end of 1912 and 1913 respectively: horses, 1,581,743 and 1,582,125; cattle, 1,399,498 and 1,388,708; sheep, 3303 and 2946; goats, 101,475 and 89,239; swine, 308,970 and 309,995.

**OTHER INDUSTRIES.** The value of mineral and metal products in 1913 is reported as follows, in yen: coal, 70,956,121 (21,315,962 tons); copper, 42,012,126; petroleum, 12,498,506; gold, 7,252,000; silver, 5,635,124; iron, 2,552,245; sulphur, 1,568,432; steel, 809,087; lead, 617,866.

In 1913, the total fisheries products were valued at 146,792,422 yen, as compared with 137,984,518 in 1912.

On Dec. 31, 1914, factories (with more than 10 employees) numbered 15,897; employees, 916,252 (375,596 male, 540,656 female). Cotton-spinning companies, June 30, 1915, numbered 38, with 2,354,258 spindles; consumption, 384,431,509 pounds of cotton; production, 335,426,573 pounds of yarn. Cotton-weaving companies, 16, with 26,954 looms; production, 247,557,169 pounds. Other important manufactures are

paper, silk, matches, pottery, lacquered ware, matting, and leather.

COMMERCE. The table below shows imports and exports of merchandise, in yen:

Imports:	Foreign produce		Japanese produce		Total
	1913	1914	1913	1914	
1904	370,807,791		552,948		871,360,739
1909	893,141,499		1,057,844		894,198,848
1912	618,160,786		831,491		618,992,277
1913	728,626,129		805,515		729,431,644
1914	594,502,221		1,283,504		595,785,725

Exports:	Foreign produce		Japanese produce		Total
	1913	1914	1913	1914	
1904	3,531,804		315,729,592		319,260,896
1909	3,139,191		409,973,820		413,112,511
1912	2,366,921		524,614,921		526,981,842
1913	2,938,968		629,526,250		632,460,218
1914	4,804,166		586,797,295		591,101,461

In 1904 specie and bullion were imported to the value of 33,940,856 yen, and exported, 107,795,858 yen; in 1909, 79,587,502 and 6,584,327; in 1912, 11,544,351 and 28,325,153; in 1913, 1,021,351 and 27,093,346; in 1914, 9,107,081 and 29,649,935.

Classified imports and exports of merchandise, in thousands of yen:

SHIPPING. There were entered at the ports in 1914 in the over-sea trade 9745 vessels, of 23,631,639 tons (of which, sail 294, of 47,157 tons); cleared, 9820 vessels, of 23,560,850 tons (of which, sail 298, of 46,703 tons). The number of Japanese vessels entered was 6597, of 12,752,390 tons; British, 1875 vessels, of 6,697,859 tons; American, 184, of 1,286,400 tons; German, 355, of 1,281,973 tons; Russian, 396, of 667,009 tons; French, 86, of 327,637 tons. Japanese shipping in the foreign trade receives government subsidy. The merchant marine on Jan. 1, 1915, consisted of: 2133 steamers above 20 tons, of 1,577,025 tons net; 7943 sail above 20 tons, of 513,244 tons net; and native craft to the number of 20,635.

COMMUNICATIONS. As reported for 1914, the length of railway in operation (including that in Formosa) was 6593 miles, of which 5472 miles were state railway and 1121 miles railway owned by private companies. Electric tramway, 1293 miles. Gross expenditure of the railways in 1913-14 was 120,612,571 yen; expenses, 98,307,545 yen. At the beginning of 1916 the total mileage open to traffic was 7131.71, of which 5686.26 miles belonged to the state. The total cost of construction was 832,741,126 yen. There were 3012 engines, 8048 passenger cars, 47,455 freight cars. They carried 213,368,710 passengers with 3,855,564,752 of traffic mileage, earning total fares of 55,547,850 yen. Handling 40,216,167 parcels through 3,046,498,912 ton miles (traffic mileage), the railways cleared 53,629,983 yen in freight.

FINANCE. The standard of value is gold. The monetary unit is the yen; its par value is 49.846 cents. Revenue and expenditure (ordinary and extraordinary) are shown below for fiscal years, in thousands of yen (budget estimates for 1915-16):

	1911-12	1912-13	1913-14	1914-15	1915-16
<b>Revenue:</b>					
Ord. . . . .	508,559	552,085	575,428	584,065	524,349
Extr. . . . .	148,638	135,307	146,547	104,063	79,198
Total	657,192	687,392	721,975	688,128	603,547
<b>Expenditure:</b>					
Ord. . . . .	409,889	416,895	415,636	414,682	402,281
Extr. . . . .	175,486	176,701	157,998	205,837	185,588
Total	585,375	593,596	573,634	620,519	587,864

The principal sources of ordinary revenue, as estimated in the 1915-16 budget, are as follows, in thousands of yen: saké excise, 90,554; land tax, 73,268; income tax, 35,266; sugar excise, 23,837; customs, 39,988; business tax, 13,645; tax on textile fabrics, 13,910 (total of these and other tax revenues, 316,455); public undertakings and state property, 151,956; stamps, 30,431; total estimated ordinary revenue, including items not here mentioned, 524,349. In the following table are shown by departments of gov-

ernment the 1915-16 budget estimates of expenditures, in thousands of yen:

	Ordinary	Extraord.	Total
Foreign Affairs .....	4,084	2,297	6,381
Interior .....	12,587	86,098	48,680
Finance .....	171,784	57,260	229,044
War .....	74,088	18,468	92,556
Marine .....	48,112	50,440	98,552
Justice .....	11,371	648	12,019
Public Instruction .....	9,600	805	10,405
Agriculture and Commerce ..	6,858	6,841	13,699
Communications .....	64,397	12,731	77,128
Civil List .....	4,500	.....	4,500
<b>Total .....</b>	<b>402,281</b>	<b>185,583</b>	<b>587,864</b>

The public debt, March 31, 1914, was 2,545,070,505 yen; March 31, 1915, 2,477,082,242 yen, of which 1,485,550,664 foreign and 991,531,578 internal. See also the article FINANCIAL REVIEW.

NAVY. See NAVAL PROGRESS.

GOVERNMENT. The constitution, which bears date of Feb. 11, 1889, vests the executive authority in the Emperor, who acts through a cabinet of ministers appointed by and responsible to himself. The legislative power is exercised by a parliament, or imperial diet, consisting of the House of Peers and the House of Representatives. The peers number 369, part of them having a seat in the Parliament for seven years and part of them for life. Representatives are 379 in number, elected for four years. The Emperor is Yoshihito, born at Kyoto, Aug. 31, 1879. He succeeded his father, Mutsuhito, July 30, 1912; the accession ceremony took place Nov. 10, 1915. On May 10, 1900, Yoshihito married Princess Sadako, born June 25, 1884. The issue is four sons, the eldest of whom, Prince Hirohito, born April 29, 1901, is the heir to the throne.

## HISTORY

GENERAL SUMMARY. As an outcome of the Oura bribery affair, noted in the last record, the parliamentary session of December 18th was a stormy one. A motion was brought to impeach the ministry for attempting to escape the responsibility in that case and to throw all the blame on Viscount Oura. This was defeated by a vote of 222 to 132, after a sharp debate in which the Prime Minister, Okuma, was bitterly attacked. In January, 1916, a bomb-thrower made an unsuccessful attempt to assassinate Count Okuma. On March 30th, Lieutenant-General Oka, Minister of War, resigned and died a few months later, being succeeded in the War Office by Lieutenant-General Oshima. In a statement issued early in the year, Count Okuma declared that Japan could not dispatch a large army to Europe owing to the lack of adequate means of transportation, and that Japan's work would consist merely in aiding the Allies in the Far East and supplying them with munitions. As to the economic effect of the war on Japan, statistics published in 1916 indicated an increase in the total exports to Russia during the first three-quarters of the year of 1915, also to Great Britain. Japanese merchants were trying to supplant German traders in the Southern Pacific. The exports in 1915, while showing an increase over 1914, were considerably below those in 1913, and imports had fallen off still more in the same interval. The exports for 1915 were \$354,153,499 and the imports \$266,

224,969. An important measure carried in 1916 was the child labor prohibition. This provided that no young person between 12 and 15, and no woman should work more than 12 hours a day, and that there should be two holidays a month. Accident compensation was also voted. The attacks upon the Okuma cabinet caused its downfall and a new ministry was announced October 4th with Count Terauchi (q.v.), former Governor-General of Korea, as Premier. On the opening of the Diet on Dec. 27, 1916, the address from the throne declared the union with the Entente Allies was becoming stronger and referred with congratulations to the new agreement with Russia. See following paragraph.

JAPAN AND RUSSIA. Ever since the outbreak of the war relations between Japan and Russia had been friendly and there had been many instances of coöperation toward the common end. On July 6th a political convention between Russia and Japan, consisting of two articles, was signed at Petrograd. By the first article Japan and Russia had declared that they would not be a party to any political arrangement or combination directed against the other. By the second they declared that if the territorial rights or special interest of either in the Far East were threatened, they would take counsel together as to measures for the safeguarding of those rights. It was explained that the agreement was not directed against any other power, and that it would not prejudice the interests of other powers in the Far East. This accord was warmly approved by all the other members of the Entente. It was the culmination of arrangements which since the treaty of Portsmouth (1905) marked the progress of Russia and Japan toward closer relations. In the first place there had been the agreement of 1907, which was for the purpose of avoiding misunderstanding. Then came that of 1910, with a view to developing the previous agreement for the purpose of consolidating peace in the Far East.

JAUNDICE, HEMORRHAGIC. (INFECTIOUS JAUNDICE; WEIL'S DISEASE.) A specific organism has apparently been discovered in connection with this disease. Investigators now generally believe that every case of hemorrhagic jaundice with relapses, with or without hemorrhages, should be regarded as infectious. This disease seems to have an incubation period of seven days and is similar to the icteroid typhoid described by Larrey in Napoleon's day, and later by Landouzy and Lancereaux in 1882. The organism has been isolated by Martin and is apparently identical with the *Spirochaeta icterohemorrhagica* described recently by Inada and Ido.

To Professors Inada and Ido was awarded on April 4, 1916, the Asakawa prize for their discovery of this causative organism in Japan, where the disease prevails endemically. Inada's first report appeared in Fukuoka *Ika-Daigaku-Zasshi* (Journal of the Medical College of Fukuoka Imperial University) on Jan. 20, 1915, and is entitled "Preliminary Report on the Study of the Spirochetosis that Develops Icterus and Hemorrhages that Prevail in Japan."

Results reported by Hübener and Reiter, and Uhlenhuth and Fromme, who have been working independently, show that the disease is transmissible in laboratory animals, the guinea pig being especially susceptible. The virus is filterable through Berkefeld filters. In the tissues

and blood of infected animals, especially in the liver, are found the characteristic spirochetal organisms which seem to show an unusual variability in form and exhibit no constancy in their morphology. From the swellings and nodules which they often present, the name *Spirochaeta nodosa* is proposed for them. The reports quoted were published in October, 1915. It appears therefore that the causative agent of this disease has been discovered independently in Germany and Japan.

**JAVA.** An East Indian island, the most populous and most important of the Dutch colonial possessions. See DUTCH EAST INDIES.

**JELlicoe, Sir John.** A British naval officer, appointed First Sea Lord in December, 1916. He was succeeded as commander in chief of the grand fleet by Sir David Beatty.

**JESSUP, WALTER ALBERT.** An American educator, chosen in 1916 president of the State University of Iowa. Since 1913 he had been dean of the university's College of Education.

**JEWELRY WORKERS.** See STRIKES.

**JEWISH RELIEF.** See JEWS AND JUDAISM; RELIEF FOR WAR VICTIMS.

**JEWS AND JUDAISM.** It is still impossible to give exact figures of the number of Jews throughout the world. No census has been taken since the years 1910-11, and the figures quoted are those based on the returns of the census taken in the above mentioned years. The *Jewish Year Book*, the best authentic source available for Jewish statistics, repeats in its last issue (1916-17) the tables of the last two years, which are: Total number of Jews of the world, 13,777,542, distributed among the continents as follows: Europe, 9,988,197; America, 2,500,054; Asia, 356,617; Africa, 413,259; Australia, 19,415. The European countries having a large Jewish population are Russia with its 6,060,415, followed by Austria-Hungary with 2,258,262; Germany with 615,021; Rumania with 269,015; Great Britain with 245,000; the Netherlands, 106,309; and France with 100,000 Jews. In America over 95 per cent of the entire Jewish population are distributed in the three most important countries: United States with a Jewish population of 2,349,754, followed by Canada with 75,681, and the Argentine Republic with 55,000. In Asia, Turkey, 177,500, and Palestine, 7800, are the most important seats of the Jewish population. Morocco, 110,000, and Tunis, 108,000, lead in the number of Jews in the continent of Africa. That the figures quoted are not exact is self-evident. The natural increase of a population of over 13,000,000 for half a decade or more is quite considerable, and has undoubtedly raised the total population of the Jews by a high figure. Especially erroneous are the estimates made for Russia and the United States. The former is based on the 1905 census, and the latter on the 1910 census, which gave only the number of the Yiddish-speaking Jews. Accordingly, the latest estimates for Russia were 7,000,000, and for the United States, 3,000,000 or above. In view of all these facts, we can safely place, in spite of the havoc wrought in them by the war, the total number of Jews throughout the world to be 14,000,000.

**GENERAL EVENTS.** The central point in Jewish history in 1916 is still the great war and its effects. But, while economic misery and commercial ruin, occasioned by the duration of the war, have considerably increased among the Jews

of the war zones, and especially among those of Russia, Poland, and Galicia, the past year has not witnessed any great and shocking tragedies in Jewish life, such as the wholesale expulsion of half a million Jews from their homes which occurred during the preceding year. Excepting the two great events, the entrance of Rumania into the war and the invasion of the Bukowina and a great part of Galicia by the Russians, which added misery and suffering to more than 300,000 Jews, the great mass of east European Jews remained during 1916 in statu quo, and the course of their history has not been greatly deviated from that of the preceding year. On the contrary, the black cloud of the war has displayed its silver lining during the year. The remarkable vitality of the Jewish people has asserted itself. A great deal of constructive work has been accomplished during the year. The Polish Jewry under a new régime, enjoying full civil rights, has completely reorganized itself. Especially notable are the events of establishing a net of elementary and a number of higher schools where the languages of instruction are Yiddish and Hebrew, and the organization of charitable and social work. A number of conferences were held during the year in Warsaw and other cities which dealt with the regulation of Jewish life and brought good results.

Not less remarkable was the work of the Russian Jewry. In spite of the great disadvantages that beset the work of recuperation, the reconstruction of Jewish life went on regularly and continuously. The great mass of refugees, transferred to new places of habitation beyond the pale, were aided by their brethren outside of the war zone, and especially by the committees of Petrograd and Moscow in adjusting themselves to their new environment, in organizing their individual as well as their communal lives. Especially fruitful was the work in the field of education. Numerous schools were established for the children of the refugees in cities of inner Russia where a Jew has never stepped on their sacred soil. Loan societies and other coöperative institutions tending to alleviate the misery of the expelled were organized by the various committees and preparations made for a Jewish Congress after the war.

**RELIEF WORK AND CONGRESS MOVEMENT.** The effect of the war upon the Jews outside of the war zone tended to consolidate the various factions in Jewry and stimulate their Jewish consciousness. Accordingly, the work for the relief of their stricken brethren was very intense, and especially in the United States. Of the \$6,500,000 collected in this country during the last two and one-half years, about two-thirds of the sum was collected during the year 1916. The naming by the President of January 27th as the Jewish relief day and the complete organization of the various relief committees throughout the country, were the principal factors in the successful work.

The congress movement which originated last year had to face its difficulties and struggle its way towards realization. It almost threatened to divide American Jewry into two camps, but the crisis was finally averted. The bone of contention was the nature and character of the proposed assembly, whether it should be a congress, namely, a representative body elected by the people, or a conference of representatives

of certain organizations. The masses were for the former type, while the American Jewish committee advocated the latter type. In March, 1916, a preliminary conference attended by a large number of delegates was held at Philadelphia and adopted a resolution endorsing the calling of a congress. The other party called a meeting in June and decided in behalf of a conference. Negotiations for a settlement were begun, and after one compromise was rejected by the Philadelphia delegates, a final agreement was reached recently (Oct. 2, 1916), whereby the two principles laid down by the Philadelphia conference, namely, democratic representation and the demand from the future peace conference for the protection of Jewish rights in Palestine, were accepted by all. See also RELIEF FOR WAR VICTIMS, *Jewish Relief*.

**LABOR AND LEGISLATION.** The Jewish labor world in this country, which centres principally around the clothing industry, was stirred to its depths by the declaration of a strike in the most important branch of the industry, in the cloak and suit trade. The manufacturers refused arbitration and as a result a lockout was declared by them early in May, and as a subsequent result, the workers declared a general strike which affected 60,000 laborers, 80 per cent of whom were Jews. The strike lasted for 13 weeks and was finally settled. In addition there occurred also minor strikes, the most important of which was the tailor strike. See ARBITRATION AND CONCILIATION, INDUSTRIAL; STRIKES.

The most notable legislative matter affecting Jews was the attempt of Congress to impose a literacy test for immigrants, exempting the Russian Jews on the basis that they come from a land where educational opportunities are denied them. To the minor legislative events may be counted the passing by the New Jersey Senate of a law requiring the reading of passages from the Old Testament in the public schools as well as the defeat of a similar bill in the New York Legislature.

**PERSECUTIONS AND DISABILITIES.** The year on the whole presents a brighter aspect than the preceding year as far as this phase of Jewish life is concerned. Yet it has its quota of persecution, especially in Russia and Rumania. In the former, the real Russians were very active in the early part of the year in propagating hatred against the Jews, and spreading rumors that the Jews raise the prices of food, and are working against the success of the loans of the government, and as a result disturbances occurred against the Jews. These activities, however, were later checked by the government. A slight change in the statute affecting the promotion of Jewish lawyers occurred, and a percentage system was inaugurated. The educational restrictions were also extended to private schools. There occurred also some slight expulsions from frontier towns, but the orders for some were later revoked. In general, the policy of the Russian government towards the Jews was an unstable one. At times it tended to lighten their burden, but it soon relapsed to its former system of oppression. In Rumania, the Jewish situation was aggravated by a systematic expulsion of Jews from villages and frontier towns.

**LITERARY AND MINOR EVENTS.** The war has stimulated literary activity among the Jews of this country. The most important event of the

year is the establishment of a number of weeklies: *The American Jewish Chronicle* in English; the *Hatoren* (the 'Mast'), and the *Haiברי* (the 'Hebrew'), in Hebrew. The lovers of Hebrew and Yiddish literature throughout the world had their joys and sorrows during the year, the former in celebrating the 25th literary anniversary of the foremost Hebrew poet, Ch. N. Bialik, and the 60th birthday of Ahad Haam (Asher Ginzberg), the leading Hebrew thinker and essayist; the latter in mourning the deaths of Joseph Jacobs (q.v.), Scholem Aleichem (q.v.), and Simon Frug, a notable poet in the Russian, Yiddish, and Hebrew languages. Of the books issued during the year the most important was the translation of Dubnow's *History of the Jews in Russia and Poland*, published by the Jewish Publication Society. An important event for Judaism in this country is the dedication and the opening of the Rabbinical College, an orthodox seminary for training rabbis on a modern basis. Of minor events, there can be recorded the celebration of the 50th anniversary of the *Reform Advocate*, the leading organ of the reform Jews, and the celebration of the 70th anniversary of the congregation Shaare Tephila of New York City, and the 75th anniversary of the congregation Beth Ahaba of Richmond, Va.

**ZIONISM AND NATIONALISM.** The year 1916 saw the Zionist movement emerge from the difficulties imposed upon it by the war triumphantly. Not only was it not crushed, as it was predicted by some, but it took a new lease on life. Only a small number of the colonists left Palestine; the great majority became Ottoman subjects and, aided by the Zionists throughout the world, carried on their work as heretofore. The educational institutions in the Holy Land were reopened with full attendance. The movement as a whole increased during the year, both in the number of its adherents and in moral strength. The work was intense, especially in this country. The Provisional Committee, which is at present the central organization of the Zionists of the world, supported by Justice Brandeis (q.v.), has raised during the year large sums of money for the support of the Palestinian colonization. Two conventions, that of the Order of Sons of Zion and the Federation of the American Zionists, were held during 1916 in the months of June and July respectively, and both were attended by hundreds of delegates. Zionist activity was not limited to neutral ground only, but also the Jews of the belligerent countries contributed their share, especially those of Poland, where Zionist activity was recently revived at a conference of all the Polish Zionists at Warsaw. On the whole, Jewish national sentiment ran high during the year, and manifested itself even in such communities where it was least expected. To the latter belongs the formation of a league of the young Italian Jews under the name *pro causa Hebraica*.

**JOFFRE, JOSEPH J. C.** See FRANCE; WAR OF THE NATIONS.

**JOHNS HOPKINS UNIVERSITY.** A non-sectarian educational institution at Baltimore, Md., founded in 1876. In some departments both men and women are admitted, and in others men only. The university is best known for the opportunities for graduate work that it offers. In 1916, 2759 (less duplications,

2559) students were enrolled—1011 in regular courses, 1095 in afternoon and night courses, and 653 in summer courses. The faculty, in which there were no notable changes during the year, numbered 286. Gifts amounting to \$116,198 were received, the chief item being a bequest of \$106,825 from James N. Beall of Baltimore, to be used for general purposes. In the year 1915-16 the productive funds of the institution amounted to \$6,551,000, and the income to \$549,777. In the library were 193,000 volumes. President, Frank Johnson Goodnow. See also UNIVERSITIES AND COLLEGES.

**JOHNSON, HIRAM W.** Elected Republican United States Senator from California, Nov. 7, 1916. See CALIFORNIA, *Politics*; UNITED STATES, *Presidential Campaign*.

**JOHORE.** A native state located at the southern extremity of the Malay Peninsula, and under British control. Estimated area, 9000 square miles; population (1911), 180,412, about one-half Malays and one-third Chinese. Johore Bharu, the capital, has about 20,000 inhabitants.

**JOINT STOCK BANKS.** See AGRICULTURAL CREDIT.

**JONES, A. A.** Elected Democratic United States Senator from New Mexico, Nov. 7, 1916.

**JONES, HARRY CLARY.** An American chemist, died in Baltimore, Md., April 9, 1916. He was born at New London, Md., in 1865, and, except for a period of study at Leipzig, Amsterdam, and Stockholm, was connected with Johns Hopkins University from the time that he entered it as a student in 1885. There, after graduating and taking his Ph.D. (1892), he taught, rising to be professor of physical chemistry in 1904. It was in recognition of his distinction in this branch of science that the Franklin Institute awarded him its Langstreth medal in 1913. He was a research associate of the Carnegie Institution. Professor Jones was an associate editor of French, German, and American chemical journals, and besides translating an important German work, he wrote, among other volumes: *Elements of Physical Chemistry* (1902; 4th ed., 1915), translated into Russian and Italian; *Elements of Inorganic Chemistry* (1903); *Electrical Nature of Matter and Radioactivity* (1906; 3rd ed., rev., 1915); *Introduction to Physical Chemistry* (1910); *A New Era in Chemistry* (1913); *Conductivities and Viscosities in Pure and in Mixed Solvents* (1915).

**JONES, ROBERT EDMOND.** See DRAMA; MUSIC, *Ballet*.

**JORDAN, EBEN DYER.** An American merchant, died at his summer home at West Manchester, Mass., Aug. 1, 1916. The son and namesake of the founder of the drygoods firm of Jordan, Marsh, and Company of Boston, Mr. Jordan was born in Boston in 1857. After a course at Harvard College, unfinished because of ill health, he entered his father's store as a clerk, gradually rising until by 1880 he had become a member of the firm. Later he succeeded to the presidency. The store came to be one of the best known in the country. Mr. Jordan's interests outside business were varied. He established the Jordan Art Gallery, and made a collection of paintings notable for the care used in selecting as well as for intrinsic worth. Of musical organizations he was a liberal supporter, becoming president of the New England Conservatory of Music (to which he left \$100,000)

and of the Boston Opera Company, a director of the Metropolitan Opera Company of New York, and honorary director of the Royal Opera, London. For long he had a famous stud of hackney horses, the American Hackney Horse Society electing him its president in 1905. Besides his own business, he had various commercial interests in Boston. His father's estate, of which he was a trustee, consisted of about \$3,000,000.

**JUDAISM.** See JEWS AND JUDAISM.

**JUKES FAMILY.** See ZOOLOGY, *Heredity*.

**JUPITER.** See ASTRONOMY.

**JUSTICE.** A play by John Galsworthy. See DRAMA.

**JUTLAND, BATTLE OF.** See NAVAL PROGRESS; WAR OF THE NATIONS.

**JUVENILE COURTS.** Special courts for the hearing of cases growing out of violations of the law by boys and girls have now been established in all cities and are in process of extension to rural communities. These courts are based primarily on the belief that usual methods of dealing with youthful offenders harden their natures and that reform and prevention should be striven for. In place of trial by jury before an open court with newspaper publicity, there has been substituted private hearings by the judge alone. This affords an opportunity for an individual treatment of each case. In addition probation officers and social workers can be in personal touch with the youthful delinquent and seek to better the home life and the habits and attitude of parents as well. In some of these courts there have been established psychopathic clinics for the study and treatment of the feeble-minded or mentally defective. The most advanced step in this direction was taken by Chicago in 1916 in the establishment of the Chicago and Cook County School for boys. This school for delinquents will advance the work of the Juvenile Court in many respects. Some courts also maintain clinics for the correction of physical defects. So important is becoming the study of physical and mental disorders that the view of child and youth as willful law breakers, that is, as purposeful criminals, is being abandoned in favor of the view that they are abnormal, defective, or suffering from lack of proper education or home training.

**VARIOUS IMPROVEMENTS.** The New York Legislature in 1915 passed a law giving the children's courts of New York City a board of justices of their own and separating these courts entirely on the administrative side from any adult criminal courts. Experience under this change has shown that cases are handled more readily and effectively, judges acquiring greater experience and proficiency. In New York City the Commissioner of Police found that the organization of juvenile police, consisting of forces of 25 or more boys in any police precinct, such boys being between the ages of 11 and 15, proved an effective factor in the prevention of delinquency. In Seattle and San Francisco forward steps were taken in prevention of juvenile delinquency through cooperation of boards of education with the courts and the completion of new buildings.

Improvements in the Boston Juvenile Court resulted from the report of the State Commission on Probation provided by the State Legislature in 1915. This commission recommended

that the Juvenile Court be given jurisdiction of parents under many circumstances. They also further protected the children's sessions from publicity and excluded children from the trials of adult criminals. A new provision regarding appeals was proposed which would guarantee that every appeal of a juvenile case should be heard by the higher court and that the Supreme Court would hold special sessions for juvenile cases with separate trial list and docket. Previously a large proportion of appealed cases remained unheard.

In Maryland the Legislature gave the judges of the Circuit Court power to designate one of their number to sit in juvenile cases. This makes possible the extension of the juvenile court system to all the counties of the State.

In Chicago, Judge Victor Arnold succeeded Judge Merritt W. Pinckney as judge of the Juvenile Court, the latter withdrawing on account of ill health. During Judge Pinckney's seven years' term of office 11,819 delinquent boys and 4089 delinquent girls came before him. His administration achieved the appointment of probation officers by test of merit, appointment of a woman assistant to the judge of the court, the establishment of the first psychopathic laboratory, and the successful establishment and administration of funds for parents.

**DISTRICT OF COLUMBIA.** A new juvenile court law applying to the District of Columbia was passed by Congress. An amendment providing that juvenile offenders be assigned to correctional institutions by separation of race and that officers of institutions be assigned according to race, was defeated. The law provided that the Board of Children's Guardians shall be appointed by the judge of the Juvenile Court instead of by the judges of the Police Court as at present; that the court may in its discretion place children, if taken from their parents, under the guardianship of an individual, or an incorporated society or the Board of Children's Guardians (the previous law named only the latter agency); that the court shall continue to have jurisdiction over the child even though it be placed under the guardianship of another agency; and that the detention house shall be under the control of the juvenile court instead of the police. The old law made the Juvenile Court essentially a police court with procedure and terminology according to the traditions of the criminal law and criminal courts. Under it, for a slight misdemeanor, a child acquired a "record" which would forever disqualify him from jury duty, and perhaps from holding office or entering public service.

**KAISER-WILHELMSLAND.** That part of the protectorate of German New Guinea which is in the island of New Guinea. The estimated area is 70,135 square miles. The number of inhabitants is not definitely known, but is estimated at about 531,000. The country was taken by Australian military forces in October, 1914. See **GERMAN PROTECTORATES.**

**KALOGERPOULOS, NIKOLAS.** A Greek statesman, who became premier the middle of September, 1916. He had lived long in France, where he took the degree of Doctor of Laws at the University of Paris, and had been Minister of Finance and Minister of the Interior. He announced a policy of benevolent neutrality toward the Entente cause in the European war. His cabinet was overthrown within a month and  
Y. B. 16—13.

Prof. Spyridon Lambros (q.v.) became the next premier.

**KAMERUN.** A German protectorate of west central Africa, between Nigeria and French Equatorial Africa, occupied by the French and British in 1916. It extends north to Lake Chad and east, at one point, to the Ubangi River. The coast line is broken by the comparatively small Spanish colony of Rio Muni y Cabo San Juan. Kamerun has an estimated area of 790,000 square kilometers (305,000 square miles), which is about 46 per cent larger than the area of Germany. The protectorate was established by the Germans in 1884, but a considerable part of the country was ceded by France from French Equatorial Africa in 1911. The population of this ceded territory is supposed to approximate 1,000,000; the population of the remainder of the protectorate has been estimated at over 2,650,000, consisting of: native colored, 2,649,000; other colored, 2000; whites (Jan. 1, 1913), 1871, of whom Germans, 1643.

Imports and exports were valued in 1912 at 34,242,000 and 23,336,000 marks respectively; in 1913, 34,816,000 and 29,151,000. Imports from Germany in 1912, 27,216,000 marks; exports to Germany, 19,841,000. Leading imports include machinery and other manufactures of iron and steel, cotton fabrics, rice, provisions, and fish. Principal exports in 1912 and 1913 respectively, in thousands of marks: 11,473 and 12,122; palm kernels, 4406 and 6226; cacao, 3721 and 5718; palm oil, 1622 and 1961; cola nuts, 167 and 971; timber, 696 and 941; ivory, 536 and 824; bananas and banana meal, 18 and 68. Railway in operation at the end of 1913, 310 kilometers (193 miles); under construction, 133 kilometers (83 miles). The budget for 1914-15 was continued for 1915-16; it balanced at 32,490,409 marks, 14,094,091 marks being the estimated local receipts, 3,166,318 marks imperial contribution, and 15,230,000 marks loan. German administrative headquarters, Buëa.

Toward the close of 1915, after Buea, which had become the temporary capital for the Germans, was taken by the Entente troops, the town of Yaunde was declared the capital. This also was occupied by a British force on January 1st and the Germans retreated. The conquest of the country by the Allied forces was completed on February 18th. Operations had been begun in Kamerun on Aug. 25, 1914, when a British force advanced across the border and captured a few towns, but it soon met with reverses and was obliged to withdraw. On Sept. 27, 1914, British warships bombarded the port of Duala; on October 14th Jabassi fell into the hands of the British, who also captured Susa on October 19th; on October 26th, Edea was captured by the British and French, and by the close of the year 1914 the railway from Bonaberi was in the hands of the Allies. See **GERMAN PROTECTORATES; WAR OF THE NATIONS.**

**KAMIMURA, HIKONOJO.** A Japanese admiral, died Aug. 8, 1916. He was born in Satsuma in 1849. His first active service of importance was as commander of a cruiser in the Chino-Japanese War of 1894-95. As vice-admiral and commander in chief of the second squadron, he was prominent in the Russo-Japanese War. His failure to prevent the sinking of two transports loaded with Japanese troops, when responsible for checking the activities of the three vessels comprising the Russian Vlad-

vostok squadron, brought him temporary unpopularity, which was later overcome when in August, 1904, he defeated these three warships, sinking one and badly damaging the other two. Later he did notable service in the battle of the Sea of Japan, the last great battle of the war. Afterwards he received the title of baron, and was decorated. In 1910 he was promoted to full admiral, in command of the first squadron, and in 1911 was appointed supreme military counselor. Admiral Kamimura is also thought to have led the naval assault made in cooperation with the British squadron, against the German military base at Tsingtao, China, in 1914.

**KANSAS. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 1,840,707. The population in 1910 was 1,690,949.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16, were as follows:

	Acreage	Prod. Bu.	Value
Corn ..... 1916	6,950,000	69,500,000	\$62,550,000
..... 1915	5,550,000	172,050,000	87,746,000
Wheat .... 1916	8,174,000	98,022,000	160,756,000
..... 1915	8,525,000	106,538,000	94,819,000
Oats ..... 1916	1,550,000	36,425,000	20,034,000
..... 1915	1,500,000	39,750,000	14,708,000
Potatoes ... 1916	70,000	4,970,000	8,200,000
..... 1915	71,000	5,893,000	4,861,000
Hay ..... 1916	1,680,000	2,604,000	19,790,000
..... 1915	1,766,000	a 4,062,000	22,747,000
Rye ..... 1916	46,000	667,000	784,000
..... 1915	50,000	800,000	608,000
Barley .... 1916	800,000	4,800,000	3,696,000
..... 1915	270,000	8,370,000	3,515,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments..	3,435	3,136
Average number of wage earners.....	44,215	41,259
Capital invested.....	\$156,090,000	\$163,790,000
Wages.....	25,904,000	25,970,000
The value of materials used.....	206,004,000	261,148,000
The value of products.....	325,104,000	323,234,000

**MINERAL PRODUCTION.** The lead and zinc mined in the State in 1915 was valued at \$3,676,448, or about three times the value of the production of 1914. There were produced 1618 short tons of lead concentrates, and 27,753 short tons of zinc concentrates. The total crude ore in which the lead and zinc were produced amounted to 709,400 short tons.

The petroleum production of the State in 1915 was 2,823,487 barrels, compared with a production of 3,103,585 barrels in 1914.

**TRANSPORTATION.** The total number of miles operated by railroads in the State on June 30, 1916, was 9557. The roads having the longest mileage are the Atchison, Topeka, and Santa Fe, 2815; Missouri and Pacific, 2384; Chicago, Rock Island, and Pacific, 1167; the Union Pacific, 216. There was no railroad construction of great importance during the year. The Anthony and Northern, an independent road, added to its mileage 20 miles. The Silinia Northern

was completed to Lincoln Center, a distance of 35 miles, during the year, and has since been completed to Osborne. This road has now 80 miles in operation.

**EDUCATION.** The total school population of the State in 1915 was 507,605. The total enrollment was 394,823. The average daily attendance was 308,016. The teachers, male and female, numbered 15,015. The average monthly salary of male teachers was \$85.70, and of female, \$68.20.

**FINANCE.** The report of the State Treasurer for the fiscal year ending June 30, 1916, showed a balance in the treasury on June 30, 1915, of \$147,435. The receipts for the year amounted to \$11,243,757, and the disbursements to \$10,876,256, leaving a balance on June 30, 1916, of \$1,686,215. The State has no debt.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Topeka State Hospital, the Osawatimie State Hospital, the State Hospital for Epileptics, the Home for Feeble-Minded, State Orphans' Home, the Larnard State Hospital, the Parsons State Hospital, and the Tubercular Sanatorium.

**POLITICS AND GOVERNMENT.** The Legislature did not meet in 1916. The chief political interest in the campaign centred about the election of Governor. Arthur Capper was a candidate for reelection. In the election of November 7th Governor Capper received 354,549 votes, compared with 192,037 for Lansdon, his Democratic opponent. Although the Republicans elected their Governor and other State officers and a majority in the Legislature the State was carried by Wilson by a plurality of 36,930. The vote was: Wilson, 314,588; Hughes, 277,658.

**STATE OFFICERS.** Governor, Arthur Capper; Lieutenant-Governor, W. Y. Morgan; Secretary of State, J. T. Botkin; Treasurer, Walter L. Payne; Auditor, Fred W. Knapp; Attorney-General, S. M. Brewster; Superintendent of Instruction, W. D. Ross; Commissioner of Insurance, C. J. Wilson—all Republicans.

**JUDICIARY.** Supreme Court: Chief Justice, William A. Johnston; Associate Justices, Rousseau A. Burch, Henry F. Mason, Silas Porter, Judson S. West, John Marshall, and John S. Dawson; clerk, D. A. Valentine.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Republicans .....	33	103	136
Democrats .....	7	20	27
Socialists .....	..	2	2
Republican majority..	26	81	107

See also FLOODS.

**KANSAS, UNIVERSITY OF.** A co-educational State institution at Lawrence, Kan., founded in 1866. In the summer session of 1916, 817 students were enrolled and in the fall, 2716. The faculty, in which there were no notable changes during the year, numbered 240. No large gifts were received. The productive funds amounted to \$151,000 and the total income to \$625,000. There were 200,000 volumes in the library. Chancellor, Frank Strong.

**KAOLIN.** See DIPHTHERIA.

**KARAFUTO.** That part of the island of Sakhalin which lies south of latitude 50° N. It is a part of the Empire of Japan. The area is stated at 2208.9 square ri (13,155 square miles). The population is upwards of 50,000, mostly

Japanese. The Japanese government encourages migration to Karafuto, which has much soil suitable for agriculture and pasturage and large forests of fir and larch. An important industry at present is herring fishing. Coal and alluvial gold occur. Imports and exports in 1913 were valued at 5,202,605 and 4,371,970 yen respectively, as compared with 3,357,747 and 2,422,398 in 1912. The budget for 1915-16 balanced at 1,895,833 yen.

**KARELL DIET**, or **KARELL CURE**. This system of treatment for dropsical conditions is simple and easily carried out and offers probably the best results in combating this symptom. The technic consists in administering daily 200 c.c. of milk, raw or boiled, according to the patient's taste, at four-hour periods during the day, until he loses weight rapidly, this occurring usually at the end of a week. If hunger and thirst become urgent, a small piece of toast may be given with the milk, and the mouth may be rinsed out with water, none of this, however, being swallowed. The diet is gradually increased by adding an egg, unseasoned, and white bread or toast. This ration is gradually augmented until a full diet is attained, but not more than 800 c.c. of fluid in the form of milk should be given during this period. When the full diet is reached, cocoa and tea may be substituted for milk. Fluids are restricted to 800 c.c. daily for two to four weeks after the edema has disappeared. During the treatment the patient must remain in bed, and occasionally, when symptoms are urgent and there are dyspnea, oppression, restlessness, weak pulse, or signs of uremic poisoning, other measures must be taken, according to the indications.

**KARL**, **TOM**. An American operatic tenor, died at Rochester, N. Y., March 19, 1916. He was born in Dublin, Ireland, in 1846, and early studied in England under Henry Phillips, and later in Italy. When the oratorio of *Elijah* was first produced, Mr. Karl sang the title part. For some years he sang in the Italian cities, including a season at La Scala, Milan, and in 1871 came to the United States, where he first toured with the Parepa-Rosa English Opera Company, and later joined a noted light opera organization, the Boston Ideals. With this he made his first real hit, as Ralph Rackstraw in *Pinafore*. After some years, Mr. Karl formed, with W. H. MacDonald, H. C. Barnabee, and other well known singers, the Bostonians, and this company long was popular in Gilbert and Sullivan and other operas, their greatest success being DeKoven's *Robin Hood*. Mr. Karl is said to have had a repertory of 150 operas and operettas. In later years he taught music in Rochester.

**KAROLYI**, **COUNT MICHAEL**. See *AUSTRIA-HUNGARY, History*.

**KELLOGG**, **CLARA LOUISE**. An American prima donna, died at New Hartford, Conn., May 13, 1916. She was born in the South, at Sumterville, S. C., in 1842, but her parents were from the North, and when Miss Kellogg was 14 the family went to New York to live. For several years she studied there under Rivarde, making her professional debut in 1860 at Pittsburgh as member of a concert company. In 1861 she first appeared in opera at the Academy of Music in New York, as Gilda in *Rigoletto*, and two years later, when she was only

20, she created the rôle of Marguerite in Gounod's *Faust*. From the first, this was one of her greatest successes, abroad as well as in the United States; she was engaged to sing in this opera at Her Majesty's in London in 1867. For three years after her return she gave herself to concert and oratorio work, under the management of the brothers Strakosch; to Carl Strakosch she was married in 1887. Miss Kellogg sang much abroad, appearing often before royalty. Her repertory included 40 rôles. She was properly called a dramatic soprano, for her voice, the equal of that of any contemporary soprano singer, was but half her equipment. It is said that Edwin Booth was so impressed by her histrionic ability that he urged her to devote herself entirely to acting. For three years, from 1874, Miss Kellogg headed an opera company singing in English operas of all schools, and she was a pioneer in this field. From 1881 she appeared mostly in concert, and in 1887, after her marriage, retired. Nordica and Sembrich, active for so many more years, were among her intimate friends, and she had a large acquaintance in American musical and literary circles. Her reminiscences were published in 1913 as *Memoirs of an American Prima Donna*.

**KELLOGG**, **FRANK BILLINGS**. Elected Republican United States Senator from Minnesota, Nov. 7, 1916.

**KELP**. See *FERTILIZERS*.

**KENDRICK**, **JOHN B.** Elected Democratic United States Senator from Wyoming, Nov. 7, 1916.

**KENTUCKY**. **POPULATION**. The estimated population of the State on Dec. 31, 1916, was 2,386,866. The population in 1910 was 2,289,905.

**AGRICULTURE**. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	3,400,000	95,200,000	\$82,824,000
1915	3,500,000	105,000,000	68,800,000
Wheat . . . . . 1916	890,000	8,010,000	13,297,000
1915	900,000	9,900,000	10,395,000
Oats . . . . . 1916	800,000	6,300,000	3,780,000
1915	250,000	6,500,000	3,120,000
Potatoes . . . 1916	49,000	4,118,000	5,845,000
1915	51,000	6,428,000	3,534,000
Hay . . . . . 1916	1,080,000	1,415,000	17,829,000
1915	900,000	a 1,280,000	15,750,000
Tobacco . . . 1916	484,000	435,600,000	55,321,000
1915	440,000	b 356,400,000	27,799,000
Rye . . . . . 1916	22,000	246,000	317,000
1915	24,000	288,000	271,000
Barley . . . . 1916	6,000	156,000	140,000
1915	6,000	180,000	139,000

a Tons. b Pounds.

**MANUFACTURES**. The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . . . . .	4,776	4,184
Average number of wage earners . . . . .	65,400	64,586
Capital invested . . . . .	\$172,779,000	\$193,423,000
Wages . . . . .	27,888,000	31,880,000
The value of materials used . . . . .	111,779,000	114,829,000
The value of products . . . . .	223,754,000	230,249,000

**MINERAL PRODUCTION.** The coal production of the State in 1916 is estimated at 25,330,000 tons, an increase compared with 1915 of nearly 4,000,000 tons, or 19 per cent. The chief increase was in the eastern part of the State, and was largely a by-product for gas coals, but it was shared by the domestic and steam coals also.

The production of lead and zinc in 1915 was much greater than in 1914. The shipments of galena concentrates amounted to 370 tons, valued at \$17,103, compared with 26 tons valued at \$800 in 1914.

**TRANSPORTATION.** The railway mileage of the State in 1916 was 4027. The railroads having the longest mileage are the Louisville and Nashville, 1753; Illinois Central, 570; Chesapeake and Ohio, 463.

**EDUCATION.** The school population of the State in April, 1916, was 742,808. The enrollment in the schools in 1915-16 was 542,559. The average daily attendance in the public schools was 353,549. The number of teachers in 1914-15 was 12,288, of whom 8138 were women.

**FINANCE.** The report of the State Treasurer for the fiscal year 1916 shows a balance on July 1, 1915, of \$854,423. The total receipts from all sources were \$3,927,108, and the expenditures \$9,709,096. The total outstanding interest bearing warrants at the end of the fiscal year amounted to \$4,177,369. The chief sources of revenue are from insurance taxes, railroad taxes, franchise taxes, and corporation taxes. The chief expenditures are for Confederate pensions, State institutions, and State offices.

**CHARITIES AND CORRECTIONS.** The State Board of Control administers the charities and corrections. These include the Eastern State Hospital at Lexington, Central State Hospital at Lakeland, Western State Hospital at Hopkinsville, and the Feeble-Minded Institute at Frankfort.

**POLITICS AND GOVERNMENT.** The campaign in Kentucky in 1916 turned almost exclusively upon national issues. Neither in the campaign itself nor in the party conventions that preceded it did local questions arise in such a way as to overshadow the national questions. The voting on November 7th gave the Democrats a larger majority than had been the case in presidential elections in many years. This was a disappointment to the Republican leaders, who believed because of the small majority by which the Democratic State ticket had carried Kentucky in the preceding November that the State would be carried by Mr. Hughes. The Republican national committee made a special effort in Kentucky. Mr. Hughes spoke twice in the State, and Mr. Roosevelt once. As a result Mr. Hughes ran well in Louisville, but the rest of the State showed clearly the strength of Wilson and the Democratic ticket. The vote for electors was as follows: Democratic, 269,990; Republican, 241,854; Prohibition, 3036; Socialist, 4734; Progressives, 122. The Congressional election showed no changes in the Kentucky delegation. Democratic Congressmen were elected in all the districts but two.

The Democratic State convention preceding the national convention was without national contest, in that all the delegates favored the nomination of President Wilson. The anti-pro-

hibition wing of the Democratic party at that convention secured sufficient control to name the committee, but it developed during the course of the convention that this issue is yet to be fought out in the party.

At the Republican convention a new set of leaders secured control. The delegates went to Chicago instructed for Fairbanks for first ballots, but with three-fourths of them actually for Hughes. The control of the party was centered about Mr. A. T. Hert, who was made a member of the Republican national committee, and later became Western manager of Mr. Hughes's campaign. Following the election this wing of the Republican party came out strongly for State-wide prohibition. See also LIQUOR REGULATION and LEGISLATION in 1916.

On September 4th the Lincoln Memorial at Hodginsville, built over the log cabin birthplace of Abraham Lincoln, was formally presented to the nation by the Lincoln Farm Association. President Wilson delivered the speech of acceptance.

The State during the year entered upon a vigorous plan of forest conservation. The State forester took steps to acquire possession of small tracts of cheap land which had been cut over in order to demonstrate the need of conservation.

On January 25th, by a vote of 20 to 14, the State Senate defeated the Frost bill, which carried a constitutional amendment submitting State-wide prohibition to the people. It was one of the most bitterly fought contests in the Assembly in many years. The advocates of the bill lacked only 9 votes of having enough to carry the amendment.

**LEGISLATION.** The Legislature met in 1916, and amended many important measures. A record of these is given below:

The law imposing double time for second conviction of a felony, and life sentence for a third conviction was repealed. Provision was made for the employment of prisoners on roads, prison-farms, and within prisons, and for the payment of not exceeding 15 cents a day of the earnings to the prisoner's family. Cities having light or power plants are authorized to serve other cities and towns in the State. The militia law was recodified and provision was made for the calling out and organization of the reserve militia in case the national guard is unequal to an emergency. The enrollment of all able-bodied males between the ages of 18 and 45 years was authorized. The licensing of liquor dealers was regulated, and it was made a misdemeanor for physicians to divide fees. Provision was made for the analysis of food by State agencies for the enforcement of the pure food laws. An elective workman's compensation law was enacted. The laws relating to life insurance were amended, and a State insurance board was created to supervise fire insurance rates and rate-making bureaus. The jurisdiction of the railroad commissioner was extended over express, telephone, telegram, or boat companies. An anti-trust law permitting a compensation in restraint of trade was enacted.

**STATE OFFICERS.** Governor, Augustus O. Stanley; Lieutenant-Governor, James D. Black; Secretary of State, James P. Lewis; Treasurer, Sherman Goodpaster; Auditor, Robert L. Greene; Attorney-General, M. M. Logan; Superintendent

of Education, V. O. Gilbert; Commissioner of Agriculture, M. S. Cohen—all Democrats except Lewis, Republican.

**JUDICIARY.** Court of Appeals: Chief Justice, Warner E. Settle; Associate Justices, Shackelford Miller, John D. Carroll, Ernest Clarke, Gus Thomas, Rollin Hurt; Commissioner of Appeals, W. R. Clay; Clerk, R. W. Killmer.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Democrats .....	27	63	90
Republicans .....	11	37	48
Democratic majority..	16	26	42

**KENTUCKY, UNIVERSITY OF.** A State co-educational institution at Lexington, Ky. It was founded in 1866. In the fall of 1916 there were 1035 students and 100 instructors. The Peabody Fund of the university amounts to \$40,000. The library contains 31,000 volumes. President, Henry Stites Barker.

**KEPHALIN.** A preparation extracted from the brain which has the property of coagulating blood. Brain lipid, or impure kephalin, is an ether extract of the brain of the ox, or other mammal. It may be smeared on gauze sponges or pledgets and applied to bleeding surfaces. There is also a solution of brain extract known as Thromboplastin-Hess, an extract of ox brain in physiological salt solution. McLean of the Johns Hopkins University has attempted to ascertain whether the thromboplastic properties attributed to kephalin reside in the substance itself or in some impurities. The evidence presented indicates that impurities cannot account for the blood-clotting effect, for not only brain kephalin, but also a similar substance isolated from the heart and liver have the same action.

**KERENS, RICHARD C.** An American business man and ambassador, died in Merion, Pa., Sept. 4, 1916. He was born at Kilberry, County Meath, Ireland, in 1842, but was brought to this country as a child. After the Civil War, in which he served, Mr. Kerens became interested in transportation in the West. By 1872 he was moving passengers, mails, and express from the western railroad terminals across the plains to the frontier settlements, and by 1874 he had become contractor for the Overland Mail service of stage coaches. After living for some years at San Diego, Cal., he returned as far east as St. Louis, where he made his home thereafter, identifying himself with railway interests in the Southwest and with Republican politics. From 1884 he was active in the higher councils of the party, as member of the National Committee and of the National Executive Committee. After twice being defeated for a seat in the United States Senate, Mr. Kerens was appointed by President Taft ambassador to Austria-Hungary in 1909. This office he held for four years. The *Lætare* medal, conferred by the University of Notre Dame (Indiana) on distinguished American Catholic laymen, was awarded to him in 1904. He was reputed to be very wealthy.

**KEYES, HENRY W.** Elected Republican Governor of New Hampshire, Nov. 7, 1916.

**KIAOCHOW.** A German protectorate on the east coast of the Chinese province of Shantung occupied by the Japanese in 1914. It consists of

a harbor, town (Tsingtao), and district, which were seized by Germany in November, 1897, leased by Germany from China for 99 years from March 6, 1898, and declared a German protectorate April 27, 1898. The area, exclusive of the bay, is 552 square kilometers (213 square miles). Population, about 195,000, including: Chinese, about 187,000; other colored, 3000; white (Jan. 1, 1913), 4470, of whom Germans, 4256. In April, 1915, Japanese residents (exclusive of the military) numbered 9264. Imports and exports (including hinterland trade passing through Tsingtao) were valued at 14,938,000 and 80,295,000 marks respectively in the fiscal year ended Sept. 30, 1912; in the fiscal year 1913, 121,254,000 and 79,640,000. There came from China in 1912 imports to the value of 47,880,000 marks; in 1913, 32,439,000. Principal exports in the fiscal years 1912 and 1913, in thousands of marks: straw braid, 33,398 and 17,590; peanuts, 10,380 and 11,382; Shantung pongees, 4058 and 8009; yellow silk, 6479 and 7507; peanut oil, 7018 and 7187; raw cotton, 3425 and 5612; cattle hides, 1770 and 3169; bean oil, 2389 and 2756; cattle, 1511 and 2671; coal, 2573 and 2593; silk waste, 2185 and 1062. There were entered at Tsingtao, in 1913, 923 vessels (exclusive of junks), of 1,298,622 tons. The Shantung Railway, 434 kilometers (270 miles) in length, extends from Tsingtao to Tsinan, capital of Shantung, with a branch from Changtien to Poshan. The budget of the protectorate for 1914-15 was continued for 1915-16; it balanced at 18,411,590 marks, 8,064,601 marks being the estimated local receipts, 9,988,602 marks imperial contribution, and 1,358,387 marks treasury balance.

On Aug. 27, 1914, Japan began the blockade of Tsingtao, which surrendered to Japanese and British forces on November 7th following. The protectorate has since been administered by the Japanese. See GERMAN PROTECTORATES.

**KING, BASIL.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, American.

**KING, GRACE.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, American.

**KING, WILLIAM FREDERICK.** A Canadian surveyor and astronomer, died at Ottawa April 23, 1916. He was born at Stowmarket, Suffolk County, England, in 1854, came to Canada in early youth, and was educated at the University of Toronto. After working for some years on Dominion land surveys in the Northwest he became government inspector of surveys and chief inspector in 1886. In 1890 he became chief astronomer of the Department of the Interior, in 1905 director of the Dominion Astronomical Observatory, and in 1909 superintendent of the Dominion Geodetic Survey. In 1904-07 he was a member of the International Waterways Commission, and a commissioner for the international boundary between the United States and Canada under the several treaties relating thereto. In 1908 he was made a C.M.G. He was elected president of the Royal Society of Canada in 1911. He published *Astronomy in Canada* and many other scientific papers.

**KING, W. H.** Elected Democratic United States Senator from Utah. Nov. 7, 1916.

**KIRBY, WILLIAM FOSGATE.** Elected Democratic United States Senator from Arkansas, Nov. 7, 1916.

**KIRCHHOFF, CHARLES WILLIAM HENRY.** An American technical editor, died at his sum-

mer home in Asbury Park, N. J., July 23, 1916. He was born in 1853 in San Francisco. At 21 he graduated as mining engineer and metallurgist from the Royal School of Mines at Clausthal, Germany. From 1877, when he became assistant editor of the *Metallurgical Review*, until his retirement in 1910, he devoted himself to journalistic work, although at the same time serving as vice-president and general manager of the David Williams Company of New York. In earlier life he was connected with the *Iron Age* and the *Engineering and Mining Journal*, returning to the former periodical, of which he was editor in chief from 1889 to 1910. From 1883 to 1906 Mr. Kirchhoff was also a special agent of the United States Geological Survey for the collection of statistics on the production of lead, copper, and zinc. A recognized authority on the iron and steel industry of the country, he was often consulted by Andrew Carnegie and other leaders. Twice he held the presidency of the American Institute of Mining Engineers (1898-99 and 1911-12), and he was elected a member of the Iron and Steel Institute of Great Britain and honorary member of the Franklin Institute, Philadelphia. *Notes on Some European Iron Districts* was published by him in 1900.

**KIRCHWEY, GEORGE W.** See PENOLOGY.

**KITCHENER OF KHARTUM, HORATIO HERBERT**, first Earl. A famous British soldier and administrator, drowned at sea June 5, 1916, when the cruiser *Hampshire* was sunk by a German mine off the West Orkney Islands. He was on his way to Russia on a military mission. The son of a soldier, Lieut.-Col. H. H. Kitchener, Lord Kitchener himself was all his life identified with military affairs. After the death of Lord Roberts, he was without peer as the greatest British soldier of his time. Although both his parents were English, he was born in Ireland, in County Kerry, June 24, 1850. He studied under tutors in Switzerland and London, and at Woolwich Military Academy, obtaining a commission in the Royal Engineers in 1871. For a short time before this, he served in the French army under General Chanzy, in the Franco-Prussian War, having enlisted while on a visit to his father at Dinan. In 1874 he joined the staff of the Palestine Exploration Society, and for four years was engaged in survey work in the Holy Land. Later similar work in Cyprus resulted in a new map of that island.

During service in the Egyptian campaign against Arabi Pasha (1882), Kitchener was able to make himself so useful, partly because of his ability to speak Arabic, that he was soon second in command of the Egyptian cavalry. Two years later he accompanied part way the fruitless expedition under Sir Herbert Stewart, sent to the relief of General Gordon at Khartum. During the next few years, from 1886 as governor-general of the Red Sea littoral and commandant at Suakim, he was principally occupied in the suppression of the Emir Oman Digna. It was at this time, in the battle of Handub, that he received his first and only wound, a bullet wound in the neck. Colonel and aide de camp to Queen Victoria, adjutant-general (1892), sirdar (commander) of the Egyptian army, and knighted, K.C.M.G. (1894)—this is the record that leads up to the first great period in his career.

The feat for which Kitchener became best known was the reconquest of the Sudan, avenging the death of General Gordon, and rescuing the country from the despotic rule of the Mahdists, with the Khalifa at their head. His march through the desert to Khartum, building a railroad as he went, is one of the most extraordinary achievements in British military history. Obstacles generally supposed fatal to such an expedition were surmounted, and the whole enterprise proved to be the best example of Kitchener's relentless energy, executive genius, and power to grasp a situation in all its aspects, economic and social as well as military. His preparatory work began in 1896; Khartum fell Sept. 2, 1898. During all this time the dervishes were gradually being driven back. They were surprised at Firket, and battles were fought at Hafir and Dongola, and the latter place occupied. A railroad was to be pushed 230 miles across the desert from Wady Halfa to Abu Hamed, and then on still farther. After 130 miles had been built, a flying column advanced and captured Abu Hamed and Berber. The first great battle was that of the Atbara, April 8, 1898. The dervishes lost 1700 killed, and of their leaders, Osman Digna and Mahmud, the latter was captured. The Anglo-Egyptian casualties numbered only 551. As the British came within sight of Khartum, they were engaged by the enemy, 52,000 strong, at Omdurman, on the bank of the Nile. In the spectacular battle that then took place (September 2nd), 10,700 dervishes were killed and twice as many wounded, while the British lost only 386 men. The Khalifa escaped but was slain in a later battle. Khartum was occupied, and the next day a memorial service was held in the garden of Gordon's house.

Immediately thereafter, Kitchener had to do his part to relieve the embarrassing situation caused by the fact that General Marchand had arrived from the West at Fashoda, up the river, and expected to claim the country for France. Upon his return to England the conqueror of the Sudan was acclaimed a hero. He was made Baron Kitchener of Khartum (he was afterward often spoken of as "K. of K."), received the thanks of both houses of Parliament, and the G.C.B., and was given a public grant of £30,000.

With but a short rest, and after merely beginning important constructive work in the Sudan, he was sent, at the end of 1899, to South Africa, to be chief of staff to the newly appointed commander in chief, Lord Roberts. During this period he showed that even with a great achievement to his credit, he could serve as a subordinate. Little was heard of him till it was supposed that the Boers had been effectually subjugated. The command was handed over to him in November, 1900. From then till the final peace of May 31, 1902, as it turned out, Kitchener had to use all his energy and resourcefulness to get the upper hand. Raids by guerrilla bands continued to be troublesome. The army had to be brought to a higher state of efficiency, and the commander was inexorable, as he always was, in his discipline. The Boers, under De Wet and other leaders, invaded Cape Colony early in 1901. The final British victory was achieved not by great battles, but by the creation of a chain of blockhouses, which eventually trapped the

enemy as in a net. Of this scheme of campaign Kitchener was the author. When he returned to England, he was promoted to viscount, and given the Order of Merit and a grant of £50,000.

Within a few months the government again called on him, this time to be commander in chief in India. During the seven years that he held this post, he put through a series of notable reforms in the organization, disposal, and equipment of the army, bringing it to a condition where it would be ready for efficient service in case of war. Only after journeys of inspection that covered 1500 miles and many consultations with army officers, was the commander convinced of the need for rigorous revision of the system. His plan brought him into sharp conflict with Lord Curzon, the Viceroy, when Kitchener insisted on a new army department that would leave him a freer hand. The British cabinet upheld Kitchener and Curzon resigned in 1905.

In 1909, on giving up his Indian post, Kitchener was made a field marshal. Before returning to England, he visited Australia, having been invited to give his advice regarding the defense of that commonwealth. His lengthy report on conditions evidenced the thoroughness that was his chief watchword. It was the highest praise that he could find for the United States Military Academy at West Point, which he visited shortly afterward, that it was "thorough," superior in that quality to any military school in Europe. On his advice it was taken as the model for a new Australian academy.

Except that for a short time he held a sinecure, which he never desired, the post of high commissioner and commander in chief in the Mediterranean, Lord Kitchener's next work was again in Egypt, whither he went in September, 1911, as British agent and consul-general. The country at that time was in a state of unrest, because of a religious controversy, political plots, and seditious newspapers; but it soon found that Kitchener would tolerate no disorders. A particularly delicate situation had to be met during the Turco-Italian War and the two Balkan wars, because of colonies of Italians and Greeks in Egypt, and sympathy of Egyptian Mohammedans for their Turkish coreligionists. Kitchener's blunt and dictatorial control, tempered when necessary by an effective diplomacy, saved the day. More than this, he saw the need for constructive reforms, and at once entered on a scheme for far-reaching improvements in irrigation and agriculture. He also greatly furthered the increase of military facilities, roads, etc.

When the European war broke out in the summer of 1914, Kitchener had come to England to accept an earldom. On the entrance of Great Britain into the war, a great popular demand was made for him as Secretary for War. On August 5th he received the appointment, the first soldier with no cabinet experience ever to hold the post. From this time till his death, the building up of an army able to save the country was his whole concern. The story that he had no sooner been appointed than he hurried over to the War Office and demanded that a bed be brought in so he could be there night and day, is significant. It shows the way he did things. Probably better than any other man in the British Empire he realized what the war would mean. He was not to be stampeded into

hasty measures that might bring quick victories and then swift collapse. He seems to have seen that only the deliberate, unflagging, cumulative organizing methods that he had always relied on would bring permanent results. He stated that he believed the war would be likely to last three years. His was the problem of building up at home out of raw material a great army that could effectively support the 200,000 men first sent to France. He long relied wholly on volunteers, and it was only as a supplementary measure that conscription was finally resorted to. Eventually much criticism was aroused, especially by disclosures that the British army in France was not being adequately supplied with munitions. It became evident that more than any one man could carry and more than any other man would have tried to carry had been placed on the shoulders of the War Secretary. Lloyd George was then made Minister of Munitions, and Lord Derby was given charge of recruiting. That Kitchener raised and trained for service some 5,000,000 men, secured the immense sums of money necessary for equipment and the myriad expenses of such an enterprise, and whipped industrial England into a condition capable of meeting, later if not sooner, the demands upon it—these achievements will never be forgotten.

Kitchener visited France several times and even journeyed to Gallipoli, which, on his advice, was afterward evacuated. When he lost his life, he was on his way to Petrograd to discuss important military and financial questions with the Emperor Nicholas. In being made Knight of the Garter in 1915, he received the highest honor that can be bestowed on an Englishman. His loss caused profound sorrow throughout the British Empire. Various memorial services were held, the chief one (in St. Paul's, London) attended by the King and Queen and Queen-Mother. Kitchener's title passed to his brother.

It is impossible in a short sketch to say more than a few words about the personality of this remarkable man. His imposing physique and carriage, his uncompromising face, and his brusque manner had combined to build up a popular idea of him as a "machine," calculating, unresponsive. This view may do him injustice. He was also generally thought to be a "woman hater"—he never married, nor would he tolerate married officers under his command, and he did not care for social life. He never spared himself and he never spared his soldiers. Consequently, he won admiration but not affection. Even when, as on several occasions, he narrowly escaped death, twice at the hands of assassins and once in the first line of trenches in France, people were not greatly moved. At last, however, his tragic death seemed to crystallize in the public mind a conception of what "K. of K.," in his 48 years of devoted and distinguished service had done for the British Empire, and he was mourned as a friend as well as a hero. In 1916 was published *Lord Kitchener*, by Ernest Protheroe (London). A noted book on Kitchener, recently reprinted, is G. W. Stevens's *With Kitchener to Khartum*.

**KNAPP, CHARLES WELBOURNE.** An American newspaper owner, died in New York City Jan. 6, 1916. Of a family noted for distinction in journalism, he was born in St. Louis in 1848, and after graduating from St. Louis University in 1865, taking his A.M. there, and graduating

in law from the University of Kentucky, he became a reporter on the *Missouri Republican*, his father's paper. Later he edited the *Weekly Republican*, then had charge of the *Republican's* Washington bureau, and in 1887, shortly before the name was changed to *St. Louis Republic*, became president of the corporation publishing the paper. This post he held until December, 1915, when he resigned to accept the office of treasurer of the *New York Times*. Mr. Knapp had just taken up his new duties the following month, when he died of apoplexy at his desk. While he was publisher of the *Republic*, it led in a campaign to force the Union and Central Pacific railroads to keep faith with the government in the matter of certain contracts (1894 and 1897). A founder, and member of the board of directors and of the executive committee, of the Associated Press, Mr. Knapp had been president of this organization in 1900; and he had also been president of the Newspaper Publishers' Association, which he helped to found.

**KNIGHT, WILLIAM ANGUS.** A British philosophical and literary scholar, died at Keswick March 4, 1916. He was born at Modrington, Scotland, in 1836, was educated at Edinburgh University, and from 1876 to 1902 was professor of moral philosophy at St. Andrews, serving also as examiner to that and other universities. Glasgow gave him the honorary degree of LL.D. Professor Knight published a large number of works, of which many have to do with William Wordsworth, including editions of the poet's works, transactions of the Wordsworth Society, works of Dorothy Wordsworth, a history of Dove Cottage, letters of the Wordsworth family, and biographical contributions. He wrote, besides, many volumes on philosophical, literary, and religious subjects, and the year before he died had published two series of *Poems on the War*.

**KNOX, PHILANDER CHASE.** Elected Republican United States Senator from Pennsylvania, Nov. 7, 1916.

**KOERBER, ERNEST VON.** See AUSTRIA-HUNGARY, *History*.

**KOREA, or CHOSEN.** Formerly an independent monarchy of eastern Asia occupying the peninsula between the Yellow Sea and the Sea of Japan; now a part of the Empire of Japan. The Japanese established a protectorate over Korea March 2, 1906, and annexed the country Aug. 29, 1910. Capital, Seoul.

**AREA, POPULATION, ETC.** The area is stated at 14,123 square ri (84,606 square miles). Estimated population in 1914, about 15,509,000. The urban prefecture of Seoul has over 300,000 inhabitants, as compared with 256,381 in 1911. Fusan had, in 1911, 81,438 inhabitants; Kwangju, 42,910; Pingyang, 39,769; Haisyōng, 38,025; Taiden, 32,822; Taiku, 31,140; Chemulpo (the port of Seoul), 26,187; Wōnsan, 20,093. The Japanese population at the end of 1913 numbered 271,591 (146,215 males, 125,376 females), and the foreign population, mostly Chinese, 17,349 (15,892 males, 1,457 females). In recent years there has been a considerable immigration of Japanese, while numerous Koreans have withdrawn to neighboring Russian and Chinese territory. Ancestor worship prevails throughout the country although Christian missions have made noteworthy progress.

Schools in 1914: Japanese: primary, 199 schools, with 826 teachers and 24,915 pupils; other, 21, with 204 teachers and 2465 pupils.

Native: 388 public schools, with 1705 teachers and 49,232 pupils; other schools for natives, 1298, with 3323 teachers and 59,855 pupils.

**PRODUCTION, COMMERCE, ETC.** The only important industry is agriculture, but cultural methods are primitive. Transportation facilities are inadequate although under Japanese administration improvements are being made. The leading crops include rice, wheat, millet, and other cereals, beans, peas, tobacco, hemp, cotton, and ginseng. The reported area under rice in 1913 was 1,044,667 cho (1 cho = 2.45 acres); wheat, 694,960; millet, 464,650; cotton, 57,879; tobacco, 19,641. Sericulture is practical, and stock raising is of some account. The number of cattle in 1913 was 1,211,011; horses, 50,652; goats, 10,456; swine, 761,186. The mineral output was valued at 6,640,171 yen in 1912 and 8,110,412 in 1913, including: gold, 4,579,963 and 5,639,437; coal, 546,388 and 574,526; silver, 15,089 and 18,237. Fisheries products in 1912, 12,619,356 yen; in 1913, 11,056,283.

Imports and exports of merchandise have been valued as follows, in thousands of yen:

	1911	1912	1913	1914	1915
Imps. ....	54,088	67,115	71,580	63,231	51,604
Exps. ....	18,857	20,986	20,879	84,389	61,370

The largest import is cotton cloth and yarn, amounting to 23,010,444 yen in 1913 and 20,025,032 yen in 1914. Rice and other food grains constitute the chief export, valued at 20,691,710 yen in 1913 and 21,757,933 yen in 1914. The gold export in 1913 was 9,972,515 yen. Imports from and exports to Japan in 1914, 39,046,962 and 28,587,019 yen respectively; China, 7,760,909 and 4,518,021. Imports from the United States in 1914, 6,127,035 yen, and from the United Kingdom, 5,434,130.

The railways in Korea are state owned and are controlled by the Railway Bureau of the Government General of Chosen. The total length open to traffic in 1916 was 1006 miles, of which 366 miles had been constructed since the annexation. The Seoul-Antung Line (309.7 miles) and Seoul-Fusan Line (247.9 miles) formed the trunk line while the other lines were branches and served as feeders to bring the trunk line into connection with important coast towns. The railways are of standard gauge, and rails weigh 76 pounds per yard in the case of the main line and 65 pounds in that of the branches. Telegraph line, in 1914, 4734 miles, connecting with the Japanese and Chinese systems. Post offices, in 1913, 559; in 1914, 583.

The monetary unit is the Japanese yen; its par value is 49.846 cents. Revenue and expenditure in the fiscal year 1914 amounted to 62,359,686 and 53,454,484 yen respectively. The budget for the fiscal year 1915 balanced at 59,412,966 yen; for 1916, 59,370,500 yen. Deficits in local receipts are covered by loans or by contributions from the Japanese government.

Korea is administered by a Japanese governor-general.

**KULPE, OSWALD.** A German philosopher and psychologist died in Munich in 1916. He was born at Candau in 1862 and in 1879 graduated from the gymnasium at Libau, where he was an instructor for the next two years. He afterward studied in the universities of Leipzig, Berlin, Göttingen, and Dorpat, returning to Leipzig University, where he took the degree of

Ph.D. in 1887, and four years later was made privat-docent in philosophy. In 1894 he was appointed professor of philosophy and æsthetics at Würzburg, in 1909 professor of philosophy at Bonn, and in 1913 professor of philosophy at Munich. He was the leading expositor of the act-psychology of the Würzburg school, and made important contributions to the theory of knowledge and to the psychology of feeling and thought. He wrote: *Grundriss der Psychologie* (1893; Eng. trans., 1895 and later); *Einleitung in die Philosophie* (1895; 6th ed., 1913; Eng. trans., 1913); *Philosophie der Gegenwart in Deutschland* (1902; 5th ed., 1911); *Immanuel Kant* (1907; 3rd ed., 1912); *Psychologie und Medizin* (1912); *Die Realisierung* (1912).

**KUWDISTAN.** See WAR OF THE NATIONS.

**KWANGCHOW-WAN.** A territory on the coast of the Chinese province of Kwantung, leased by China to France for 99 years from April 11, 1898. It forms a division of French Indo-China.

**KWANTUNG, or KWANTO.** A Japanese leasehold in the southern part of the Liaoting Peninsula, Manchuria. Area, 1221 square miles. Population at the end of 1913, 595,594, as compared with 570,421 at the end of 1912. These figures include residents of Kwantung who were in Manchuria. In 1913 there were 27 Japanese primary schools, with 213 teachers and 6745 pupils, 33 other Japanese schools, with 317 teachers and 3626 pupils, and 7 public schools for natives, with 69 teachers and 2215 pupils. Since July 1, 1907, Kwantung has formed a customs district under the Chinese Maritime Customs, Dairen (formerly Dalny) being the chief port. Trade, which is largely with Japan, amounted in 1913 to 49,401,831 yen imports and 60,292,497 yen exports; in 1914, 48,250,553 and 56,943,093. There are about 80 miles of railway open to traffic, connecting with the Manchurian systems. The budget for 1914-15 balanced at 4,444,319 yen; for 1915-16, 4,324,012 yen. Kwantung is administered by a governor-general, resident at Ryojun (formerly Port Arthur).

**LABBÉ, Léon.** A French surgeon and legislator, died in Paris March 21, 1916. Born at Merlerault, Orne, in 1832, and a graduate, in 1861, of the Faculty of Medicine, Paris, Labbé became surgeon to various hospitals, and was actively engaged in practice for about 30 years. In 1892 he entered political life, serving as Senator for the Department of Orne, and as president of the Department Council. He was a member of the Institute of France and of the Academy of Medicine, of which he was president in 1909, and a commander of the Legion of Honor. Labbé advanced various hygienic measures, the most important being that making compulsory in the army anti-typhoid vaccination. One of his notable achievements was the removal of a fork from a man's stomach.

**LABOR.** Like its predecessor, the year 1916 was marked by continued improvement of wages and hours of labor in the United States. The same may be said in a general way of most other countries, even those at war, and industrial conditions were particularly favorable in Japan and Australia. While there was consequently less marked agitation by the extremely radical labor groups, such as the Industrial Workers of the World (q.v.) and the advocates of Syndicalism, the year was nevertheless marked by

some very momentous labor disputes. (See STRIKES AND LOCKOUTS.) In consequence of a threatened railway strike during the fall the subject of compulsory arbitration of labor disputes, particularly those relating to interstate commerce and the public utilities, was extensively discussed. For this and other proposals for the maintenance of industrial peace see ARBITRATION AND CONCILIATION, INDUSTRIAL. In line with the agitation of the last few years the entire subject of SOCIAL INSURANCE (q.v.) was considered in its various aspects as treated under LABOR LEGISLATION, AMERICAN ASSOCIATION FOR; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; UNEMPLOYMENT; WORKMEN'S COMPENSATION. The subjects of MINIMUM WAGE (q.v.) and PENSIONS FOR MOTHERS (q.v.) made less progress as regards legislative results than in the two years preceding. In the article on TRADE UNIONS will be found a statement of the progress of the organized labor movement throughout the world. For other matter relating to labor problems, see AGRICULTURE; CHILD LABOR; LABOR, AMERICAN FEDERATION OF; LABOR LEGISLATION; PRICES; and WOMEN IN INDUSTRY.

**SEARS ROEBUCK AND COMPANY.** A profit-sharing scheme with some unique features was inaugurated July 1st by Sears Roebuck and Company of Chicago. The plan provided that the company would contribute annually 5 per cent of its earnings before dividends were declared to an Employees' Savings and Profit-sharing Fund. Any one employed three years in the company's service may participate. The plan thus was very democratic in scope, affecting 6000 or more employees. Each participant must deposit 5 per cent of his salary, neither more nor less, except that no employee can contribute more than \$150 per year. The contribution of the company will be apportioned among the participants in the proportion which their contributions individually bear to their total contribution. The fund will be administered by a board of five trustees, two of whom shall be employees. The company reserves the privilege of discontinuing the arrangement upon six months' notice. After 10 years of service a participant may withdraw his share of the accumulations. The same privilege is extended to women who, after five years' service, resign to get married, and to the heirs of any participant who dies. Employees who do not complete 10 years of service may withdraw their own contributions plus interest at 5 per cent compounded semi-annually. It was estimated that the contribution of the company would approximate \$550,000 per year; and of employees \$287,406. An employee earning \$20 per week and contributing \$1 per week to the fund would have to his credit at the end of 15 years \$3428; after 20 years \$5253; and after 30 years \$10,556.

**UNITED STATES.** The developments of greatest interest to labor in the United States were included in the enactment of the eight-hour day for railroad employees by Congress (see *Adamson Law* under ARBITRATION AND CONCILIATION, INDUSTRIAL), and other less notable achievements of the eight-hour day partly by strikes and partly through the extension of State eight-hour laws; the very considerable and wide-spread advance in wages taken in conjunction with steady employment with much overtime and a complete removal of unemployment (q.v.) as a pressing

social problem; the very marked advancement in public opinion with reference to social insurance (q.v.); and the continued progress in legislation protecting women and children in industry. The wage advances reached every employment and in many cases were fairly substantial, amounting for many hundred thousands of laborers to at least a 10 per cent increase. Many of these increases came toward the close of 1916 and were accompanied by special bonuses at Christmas time, benefiting at least several million workers, and by an unprecedented volume of group insurance (see under INSURANCE). Thus in November the United States Steel Corporation announced a 10 per cent advance for about 250,000 workers; the American Woolen Company a similar advance for 35,000 employees; various cotton mills in New England paid an equal advance to 33,000 operators; other steel companies employing at least 60,000 men announced 10 per cent increases in November. In December bonuses of 4, 5, to 10 per cent were announced by leading railroads, banks and trust companies, paper manufacturers, and numerous other employers. The American Telephone and Telegraph Company about December 1st announced that it would distribute \$6,000,000 among its employees, directly in proportion to length of service and inversely as to size of wages. The Eastman Kodak Company announced a distribution of \$1,000,000 among 8000 of its employees, this being 3½ per cent of annual pay for each year of service up to five years. The Crane Company of Chicago announced a distribution of \$700,000. The Standard Oil Company of New Jersey made successive advances in wages totaling 37 per cent from August, 1915, to December, 1916. The foregoing are only a few instances of a very widespread movement. For organized labor in the United States see LABOR, AMERICAN FEDERATION OF; and TRADE UNIONS.

DEPARTMENT OF LABOR. An important modification was sought in the organization of the Department of Labor by the bill introduced by Congressman Casey of Pennsylvania and Senator Jones of Washington providing for the establishment of a woman's division. The bill required this division to investigate matters pertaining to the welfare of working women, their competitive influence, and the effects of industrial employment on their health and home-life. The bill was endorsed by Secretary of Labor Wilson, who stated his belief that many phases of the employment of women could be more effectively handled under the direction of women than under the direction of men.

The Bureau of Labor Statistics continued its extensive investigations and its informing publications. The *Monthly Review* begun in 1915 contained information regarding labor conditions throughout the world. In addition publications were made in the following series of bulletins: *Wholesale Price, 1890-1915*; *Retail Prices 1907-December, 1915*; *Street Railway Employment in the United States*; *The British System of Labor Exchanges*; *Dressmaking as a Trade for Women*; *Proceedings of the Third Annual Conference of, and Proceedings of the Conference called by, the International Association of Industrial Accident Boards and Conferences*; *Causes of Death by Occupations*; *Anthrax as an Occupational Disease*; *Hygiene of the Printing Trades*; *Collective Agreements in*

*the Men's Clothing Industry*; *Labor Legislation of 1916*; *Vocational Education Survey of Minneapolis*; and *Profit-sharing in the United States*.

GREAT BRITAIN. In the early part of the war there was most bitter criticism of the attitude of British labor toward the tremendous problems raised by the international conflict. Trade unionists especially were accused of shirking, sabotage, drunkenness, engaging in strikes to delay and disorganize production, and otherwise conducting themselves in an obstinate manner. However, through legislation and tactful management on the part of Lloyd George and other governmental officials the favor of trade union leaders was won and gradually a greatly improved attitude became evident throughout the ranks of labor. The various charges against labor were thereafter widely refuted. Thus from Glasgow, Birmingham, Newcastle, Barrow-in-Furness, Sheffield, and other great industrial centres came uniform reports that drunkenness had diminished, that both men and women were coöperating loyally in production, that they were generally working long hours with much overtime, and otherwise showing full appreciation of the great responsibilities which national safety imposed upon them. This change was reflected by the pledge of the 850 delegates to the Trade Union Congress at Bristol in September to assist the government so far as was within their power with the successful prosecution of the war.

The munitions ministry instructed its committee on health of munitions workers to investigate and report on various aspects of employment in munitions factories. Ten of these reports were issued on the following subjects: Sunday labor; welfare supervision; industrial canteens; employment of women; hours of work; canteen construction and equipment; industrial fatigue and its causes; special industrial diseases; ventilation and lighting; sickness and injury. In various of these reports it was made evident that the hours and continuity of labor required by war industries were as great as those in the early days of the factory system. Large numbers of workers were found to be employed more than 70 hours per week; 12-hour shifts were common; in some cases shifts of 18 hours were found, while shifts of 13 and 14 hours were not unusual; Sunday labor was the rule. The great influx of workers in some sections had overtaxed housing accommodations so that the same beds were used night and day; family life was almost completely destroyed; large numbers of boys and girls as well as unprecedented numbers of women were employed; and excessive fatigue and undernourishment were pictured as widely existent. One report stated that the consumption of liquor in some places was directly connected with an insufficiency of cheap good food. In consequence of these conditions inefficiency was universal. It was indicated that, although many women were employed in 12-hour shifts, managers generally believed four hours to be the longest period during which a woman could work continuously at full vigor. Consequently three shifts of eight hours each were recommended. In this connection it was pointed out that the excessive night employment of women constituted a return to conditions long since abolished by law during times of peace. Industrial injuries were astonish-

ingly frequent. These reports indicated that the problems of English labor in war time involved not merely far-reaching problems of national, industrial, and military efficiency, but also the future health and vigor of the working population. That the gravity of the situation was largely appreciated was shown by numerous rules and regulations for the care of all classes of workers, and especially for women and children. See **WOMEN IN INDUSTRY**.

**LABOR, AMERICAN FEDERATION OF.** This organization, founded in 1881, has long been the largest and most powerful body of organized labor in the United States, and one of the largest in the world. At its annual convention at Baltimore, Nov. 13-25, 1916, its membership was reported as 2,072,702, organized in 21,711 local unions. Most of these unions were grouped under 111 national and international (United States and Canada) unions; there were 717 central bodies, 45 State federations, 705 local trade or federal labor unions, and 417 local department councils. These latter were organized under the five major departments of the Federation, namely, building trades, metal trades, mining, union label, and railroads. Nearly 1800 organizers were in the field to strengthen trade union bodies and to organize new groups. The income for the year ending September 30th was \$334,275; expenses, \$315,047. The organizations comprised granted during the year the following benefits: for death of members, \$2,264,611; for death of members' wives, \$163,662; for sickness, \$1,068,609; for unemployment, \$120,771. The strikes of the year included 1135 that were won, 133 compromised, 49 lost, and 305 pending; their total cost was \$2,708,789 expended in strike benefits by unions on strike plus \$154,010 in financial aid from other unions.

The annual convention approved a report of the executive council, in which the movement for social insurance was reviewed and the recommendations made that all unions give this movement extended consideration, and that, wherever established such insurance be voluntary rather than compulsory. Vigorous resolutions condemned compulsory insurance of any kind and the entrance of private companies into any sort of industrial, health, or social insurance. A movement was begun in favor of the enactment of old-age pension laws by Congress and by the various legislatures; in the same connection other resolutions called upon the executive council to review the old-age pension experience of Germany and Great Britain, and to urge the establishment of a retirement system for Federal civil employees "which will not either directly or indirectly cause them to suffer a reduction in wages during employment."

The convention favored the establishment in the Department of Labor of a bureau of safety to include not only industrial accidents but also vocational diseases. It asked Congress to investigate the subject of speculation in foods, and to place an embargo on food exports. The executive council was requested to appoint a committee to study and report on methods of cooperative production and distribution. Resolutions were adopted urging equal pay for equal work regardless of sex and the enactment of the Nolan bill providing a minimum wage of \$3 per day for every one after two years in the Federal civil service. While there was much favor expressed in the discussion for securing the eight-

hour day by legislative enactment, and while all unions were urged to work for this length of day by union methods, the convention referred the question of the eight-hour day by legislation to a special committee to be appointed by President Gompers. The latter had on various occasions expressed opposition to the use of political methods in securing the eight-hour day, preferring to secure it by industrial pressure. President Wilson's legislative programme, set forth at the time of the enactment of the Adamson Law (see **ARBITRATION AND CONCILIATION, INDUSTRIAL**) was fully reviewed and strenuous opposition taken to any measure of compulsion. This viewpoint was later expressed by various leaders in their discussion of the proposal for compulsory investigation of trade disputes.

For many years the Federation has sought the enactment of laws prohibiting the application of anti-trust legislation to trade unions. Consequently the convention urged the importance of securing the enactment of State laws "supplementing the freedom and rights established under the Clayton Antitrust Act." In this act it was declared that "the labor power of a human being is not a commodity or article of commerce"; while the exact bearing of this clause has not yet been judicially determined, the Federation leaders look upon it as a great safeguard of the freedom of labor to organize. Another matter of first importance in the recent history of the Federation has been its unrelenting opposition to the unrestrained use of injunctions in labor disputes. A report was unanimously approved in which was reviewed a decision of the Massachusetts Supreme Court declaring unconstitutional an anti-injunction law of that State; in which was urged either constitutional amendment or the right of recall of judicial decisions to secure redress in such cases; and in which it was declared "that any injunction dealing with the relationship of employer and employee and based upon the dictum that 'labor is property' be wholly and absolutely treated as usurpation and disregarded, let the consequences be what they may." The action of the Federation officials in preventing the application of the Taylor system to government shipbuilding yards was commended. Other resolutions declared in favor of an extension of industrial training, free text books, popular election of school boards, the right of teachers to organize, to permanent tenure on the basis of merit, to higher salaries, and to retirement pensions. Steps were taken to cultivate friendly relations with organized labor in Mexico, South America, and Japan.

On March 28th President Gompers sent a circular letter to the "Organized Labor Movement of all Countries" proposing that a world's labor congress be held at the time of peace deliberations at the close of the European war. The 1915 convention had voted to set aside Jan. 27, 1916, as Hatters' Day, on which each of the 2,000,000 members would devote one hour's wage to meet the fine of \$252,000 imposed by the courts upon the Danbury Hatters' Union for prosecuting an illegal boycott. However, only \$132,000 was paid in; hence the officials on May 9th issued an urgent appeal for the collection by local bodies of the remainder of this fund.

**LABOR EXCHANGES.** See **UNEMPLOYMENT**.

**LABOR LEGISLATION.** During 1916 only

a few State legislatures met, consequently the volume of labor legislation was relatively small. The more important labor laws will be found mentioned under the following headings, ARBITRATION AND CONCILIATION, INDUSTRIAL, where is treated the *Adamson Law*; CHILD LABOR; MINIMUM WAGE; OLD-AGE PENSIONS; SOCIAL INSURANCE; UNEMPLOYMENT; WOMEN IN INDUSTRY; and WORKMEN'S COMPENSATION.

**ADMINISTRATION.** The most important changes in labor law administration were those effected in Maryland and New Jersey. In the former State a Board of Labor and Statistics succeeded the Bureau of Statistics and Information. The new board is composed of three commissioners appointed by the Governor for two years. The chairman will receive \$2500 per year, and the other two, who are advisory members, \$500, in addition to necessary expenses. The new board is given the powers of the former bureau, including the collection of information regarding labor troubles, agricultural developments, mining and manufacturing, trade and transportation. It is to enforce the law regarding the employment of women, regarding health regulations, and regarding mothers' pensions. It is required to establish employment agencies and to investigate unemployment. In Massachusetts the State Board of Labor and Industries was given sole responsibility for the prevention of industrial accidents and occupational diseases, duties formerly shared with the Industrial Accident Board. The minimum wage law was so amended as to require that the commission must be composed of one employer of women, one woman, and one representative of labor. New Jersey reorganized its Department of Labor. The new department consists of a commissioner, assistant commissioner, bureaus of instruction, structural equipment, electrical equipment, hygiene and sanitation, engineers' and firemen's licenses, industrial statistics, and employment. The commissioner is appointed for five years at \$6000 a year; the assistant heads and investigators receive variously \$1500, \$2000, and \$2500. A Workmen's Compensation Aid Bureau was created, and various modifications were made in the rules for granting child labor certificates.

In New York City supervision of building operations was given to the Borough Superintendents of Buildings, subject to a Board of Standards and Appeals; and the Tenement House Department was given the regulation of bakeshops and confectioneries in tenement houses, this authority having been previously exercised by the Health Department.

**HOURS.** Massachusetts and New York passed very minor modifications in laws relating to the labor of public employees and persons engaged on public works. Louisiana eliminated from the law regarding the work of women and children, the exception in favor of mercantile establishments for the 20 days before Christmas, and limited Saturday night exemptions to stores employing more than five persons. In Maryland the posting of those sections of the child labor law relating to children under 16, together with the hours of commencing and stopping work and hours for meals, was required, penalty of not over \$10 being enacted for violation. The hours of children under 16 were limited to eight hours per day, between 7 A. M. and 7 P. M., for six days per week. Moreover, the law stated that the

presence of a child in an establishment during working hours shall be prima facie evidence of its employment therein. Women were permitted to work on Saturdays and on Christmas Eve and the five days next preceding Christmas Eve as much as 12 hours per day in retail stores outside of Baltimore, provided that on each such day at least two rest intervals of not less than one hour each be given, and provided that during the remainder of the year the working day shall not exceed nine hours. In Massachusetts the State Board of Labor and Industries was given power to determine what employments are seasonal and hence properly favored with the exemptions in favor of such employments. In Mississippi slight modifications were made in the 10-hour law for women and in the law relating to night workers, but all such modifications were subject to the 60-hour week limitation.

Numerous modifications of the 10-hour day and 60-hour week law for cotton and woolen mills were made in South Carolina. It was made a criminal offense for an employer to require or permit any one to work longer hours; the 60-hours a year excess time which the law permits in order to make up for losses from accidents must be within the same calendar year in which such loss of time occurred; and such loss of time must be made up within three months; a complete record of all lost time by days, hours, and minutes must be kept. Inter-urban railroads are prohibited from requiring employees to work more than 10 hours a day, except in case of accidents and unavoidable delay. In Massachusetts the State Board is required to investigate hours and conditions of labor in hotels and restaurants, and to report by Jan. 19, 1917. In Virginia the Sunday rest law was declared to permit the delivery on Sunday of ice cream provided same be made on another day.

**LABOR LEGISLATION, AMERICAN ASSOCIATION FOR.** This is a branch of the International Association for Labor Legislation, which has established branches in the important industrial States. It holds conferences on leading problems of industry and has been an important factor in drafting bills and forwarding progressive labor legislation. Its headquarters are at 131 East 23d Street, New York City; its secretary is John B. Andrews. It publishes quarterly the *American Legislation Review*, which during 1916 contained not only a review of labor legislation but reports of conferences on social insurance. During 1916 this organization promulgated standards for health insurance and carried on agitation for the enactment of model bills in Massachusetts and New York (see SOCIAL INSURANCE). At the same time it worked for the advancement of workmen's compensation, the establishment of adequate provisions against unemployment, and the reduction of accidents and occupational diseases, together with insurance against their consequences.

**LABRADOR.** A peninsula in British America, between Hudson Bay and the Atlantic Ocean; also, a strip along the northeast coast of the peninsula which forms a dependency of Newfoundland. Excepting this strip the peninsula is within the Canadian Province of Quebec.

**LABUAN.** A small island off the northwest coast of Borneo, administratively attached to Singapore, Straits Settlements (q.v.).

**LACAZE, ADMIRAL.** See FRANCE.

**LAFAYETTE COLLEGE.** An institution for the education of men at Easton, Pa. It was founded in 1826 and is controlled by the Presbyterian Church. The enrollment for the fall of 1916 was 632. There were 58 instructors. The following new appointments to the faculty were made: Eugene C. Bingham, professor of chemistry; J. Hunt Wilson, assistant professor of chemistry; Francis W. Dickey, professor of economics and government; and Harold McAfee Robinson, professor of biblical literature and college pastor. During the year Lafayette College received by bequest of Albert M. Seip \$250,000, and a gift of \$60,000 to endow the Helen H. P. Manson chair of biblical literature. Also, a conditional grant of \$200,000 was made by the General Education Board. Productive funds amounting to \$630,000 yielded last year an income of \$32,000. The library contains 42,000 volumes. President, John Henry MacCracken.

**LA FOLLETTE, ROBERT MARION.** Re-elected Republican United States Senator from Wisconsin, Nov. 7, 1916.

**LA FONTAINE, PETER, CARDINAL.** See ROMAN CATHOLIC CHURCH.

**LAKE WASHINGTON CANAL.** See CANALS.

**LAMAR, JOSEPH RUCKER.** An American jurist, Associate Justice of the Supreme Court of the United States, died in Washington Jan. 2, 1916. He was born at Ruckersville, Ga., in 1857, and lived in the South most of his life. He was educated at the University of Georgia and at Bethany (W. Va.) College, and in law at Washington and Lee. Admitted to the Georgia bar in 1878, he practiced at Augusta from 1880 to 1903. During this period he served in the State House of Representatives (1886-89) and in 1895 as commissioner to codify the laws of Georgia; of this code he prepared the text. Justice Lamar was appointed, in 1901, an associate justice of the Supreme Court of Georgia, to fill a vacancy, and two years later was regularly elected to this office. Ill health forced him to resign in 1905, when he again took up law practice. His appointment to the United States Supreme Court bench came in 1910 from President Taft, and was something of a surprise, the justice being a Democrat. In 1914, by appointment of President Wilson, he served as one of the two representatives of the United States at the conference at Niagara Falls, in which the representatives of Argentina, Brazil, and Chile endeavored to mediate the differences of this country and Mexico.

**LAMBROS, SPYRIDON P.** A Greek historian and political leader, chosen, according to announcement of Oct. 8, 1916, to head a new cabinet succeeding Premier Nikolas Kalogeropoulos (q.v.). He is the author of numerous historical works and a member of learned societies, and at the time of his appointment held a chair of history in the University of Athens. See GREECE, *History*.

**LAMPS, ELECTRIC.** See ELECTRIC LIGHTING.  
**LAND RECLAMATION.** See DRAINAGE; IRRIGATION.

**LANDS, PUBLIC.** Approximately 150,000,000 acres of Oregon and California land were thrown open to entry and settlement in the fall of 1916. These lands, which were granted originally to the Oregon and California Railroad Company, have been in litigation many years on

account of the refusal of the company to carry out the terms of the grant. The government sued to enforce the terms, and won the case in the United Supreme Court. Congress passed an enabling act to restore the lands to entry, but the Southern Pacific Railroad, which succeeded to the interest of the Oregon and California Company, served notice that it would refuse to abide by the act, and that it intended to fight the case anew through the courts.

The announcement was made by Secretary Lane in August, that over 250,000,000 acres of land remained in the public domain. This land is in 25 different States, extending from California to Michigan, and from Florida to Washington. All but 2290 acres are in the Far West, with the highest acreage in Nevada, 55,375,077. Twelve of the extreme Southern States alone held more than 250,000,000 acres. The exact amount uninhabited and unreserved is 250,945,589. Of this amount about 92,000,000 acres are unsurveyed. The less amount of vacant land is 952 acres, which is in Missouri. There are in Alabama 42,680 acres, in Florida 135,237, in Mississippi 30,374, in Louisiana 44,804, in Michigan, 90,540, in Wisconsin 5782. In the Pacific States there are in California 20,025,990 acres of vacant land, in Oregon 15,337,809, and in Washington 1,132,571. In the Southwestern States, Arizona 23,597,219 acres, Nevada 55,375,077, New Mexico 26,338,379, and Utah 32,968,837. In South Dakota there remain 2,382,588 acres and in North Dakota 381,199. Of the Northwestern States there are in Idaho 15,510,561 acres, in Montana 16,659,725, and in Wyoming 28,528,492. The vacant acres in Kansas are 56,080, in Nebraska 146,256, and in Colorado there remain 14,927 acres vacant. A large portion of the vacant land in these States is worthless for any purpose, either because it is extremely mountainous, or is desert land. In the Southern States a large portion is swampy land, which may be reclaimed, but only after drainage work, on a very large scale.

**LANDSCAPE GARDENING.** See HORTICULTURE.

**LAND SLIDES.** See GEOLOGY.

**LANSING, ROBERT.** See UNITED STATES; UNITED STATES AND THE WAR.

**LAOS.** See FRENCH INDO-CHINA.

**LAURENCE, SIR GEORGE.** An English anthropologist, died in London, Feb. 24, 1916. Born in London in 1853, and educated at the City of London School, he became known especially for his interest in folklore—he was a founder of the Folklore Society, had been its president and later its vice-president, and had edited the *Folklore Journal*. In addition, he had been editor of the *Antiquary* and the *Archæological Review*, and had written much on subjects in his field.

**LAW, ANDREW BONAR.** A British statesman, appointed Chancellor of the Exchequer in Lloyd George's cabinet, formed December, 1916, also a member of the War Council and a government leader in the House of Commons. Since 1900, except for short intervals, he has been a member of Parliament. From 1911 to 1915 he was leader of the Unionist Opposition, and in November of the latter year he became Colonial Secretary in the Asquith Coalition cabinet. See GREAT BRITAIN.

**LAW, RUTH.** See AERONAUTICS.

**LAWN TENNIS.** See TENNIS.

**LEAD.** The lead industry in 1916 made gains in output both in mining and smelting. The lead content of ore mined in the United States in 1916 was about 622,000 short tons, compared with 561,039 tons in 1915, an increase of 60,000 tons, or over 10 per cent. The average price of lead in 1916 was so much greater than in 1915 that the increase in value of the mined output of lead was about 50 per cent.

The State showing the largest gain in the output of lead was Missouri, which made an increase of over 25,000 tons. Good gains were also made by California, Idaho, Nevada, Utah, and New Mexico.

The production of refined lead desilverized and soft from domestic and foreign ores in 1916 was 579,600 tons, worth at the average price \$78,826,000, compared with 550,055 tons, worth \$51,705,000 in 1915. The figures for 1916 do not include an estimated output of 21,800 tons of antimonial copper, worth approximately \$4,283,000. Of the total production desilverized lead of domestic origin inclusive of silver soft lead is estimated at 324,000 tons, compared with 301,564 tons in 1915. Desilverized lead of foreign origin is estimated at 21,400 tons, compared with 43,029 tons in 1915. The production of soft lead chiefly from Mississippi Valley ores is estimated at 234,200 tons, compared with 205,462 tons in 1915, and 201,725 tons in 1914. The total production of desilverized and soft lead from domestic ores was thus about 358,200 tons, valued at \$75,915,000, compared with 507,026 tons, valued at \$47,600,000 in 1915.

In consequence of the great demand for lead a considerable quantity of secondary lead, about 7000 tons, and secondary antimonial lead, over 5000 tons, was recovered at the regular smelters.

**IMPORTS AND EXPORTS.** The import of lead was 20,600 short tons, in ore valued at \$1,575,000; 9200 in base bullion, valued at \$1,091,000; and 6000 tons of refined and old lead valued at \$803,000; a total of 35,800 tons, valued at \$3,468,000, compared with 51,491 tons in 1915. Of the imports of 1916 about 19,500 tons came from Mexico, compared with 47,124 tons in 1915. The exports of lead of foreign origin smelted or refined of the United States showed a great decrease in 1916. There were estimated 9350 tons, valued at \$3,468,000, compared with 38,445 tons in 1915. For the last three years large quantities of domestic copper have been exported to Europe, and the total for 1916 was estimated at 108,200 short tons, valued at \$14,787,000, compared with 87,092 tons, valued at \$7,796,998, in 1915.

**PRICES.** At the beginning of the year the price in New York was 5.5 cents a pound. It rose to eight cents early in April, this being the maximum figure. A decline carried the price

to 5.95 cents a pound in the early part of August. It rose again to seven cents about the middle of September, and remained stationary until early in December, when it advanced to 7.5 cents, and closed at the end of the year at about that figure. See also CHEMISTRY, GENERAL; METALLURGY.

**LEAGUE TO ENFORCE PEACE.** See INTERNATIONAL PEACE AND ARBITRATION.

**LEATHER.** The abnormal conditions due in large part to the war continued in 1916 in the leather industry, and the production and use of this commodity were the subject of much economic and technical discussion. During the year there was an increased slaughter of cattle both in North and South America and with the decrease in the European production of leather, American manufacturers were able in part to respond to the extraordinary demand and to secure extraordinary prices. So inadequate was the supply of leather that an embargo was seriously proposed. The production of leather in both Americas also was stimulated by the great war demand for beef which had involved the slaughter of many cattle without a corresponding increase in their number. And so far as the United States is concerned there was actually a progressive decrease in the number of beef cattle. The increased number slaughtered held not only for the United States but also for South America, and while it served to increase the supply of hides for the year, yet it gave rise to the question as to whether a gradual extermination of the cattle of the world was not actually taking place.

Of course, in such belligerent countries as Germany there had been a net decrease of more than 3,000,000 head of cattle since the beginning of the war, and the same condition held in other countries. Therefore with the vast numbers of cattle killed by neutral nations it was believed that with the end of the war there would be not only a decreased number to be slaughtered with the lessened demand for beef, but an even more general shortage of animals. Thus in the United States the exports of beef in the fiscal years 1915 and 1916 were 277,558,928 and 319,692,447 pounds respectively, or a total of 597,251,375 pounds for the two years ended June 30, 1916. Similar figures for 1913 and 1914, or just prior to the war, were 40,059,355 and 33,625,111 pounds respectively, or a total of 73,684,466, the war period increase representing the great total of 521,566,919 pounds. The beef exports from Canada and South America also showed corresponding gains.

The actual number of cattle slaughtered at the principal markets of the United States in 1915 and 1916 are given in the accompanying table

LIVE STOCK SLAUGHTERED AT PRINCIPAL POINTS, YEARS 1916 AND 1915

	Cattle		Calves		Sheep		Hogs	
	1916	1915	1916	1915	1916	1915	1916	1915

Wichita and Omaha count calves as cattle. St. Louis figures not available at end of 1916.

and indicate the sources of American leather, for the fundamental consideration must be observed that leather is but a by-product in the slaughter of animals for food.

But this increased production did not satisfy the demand and where the imports of cattle hides into the United States in the fiscal years 1913 and 1914 had been 7,814,659 and 7,220,417 respectively, in 1915 and 1916 they had grown to 8,839,360 and 12,840,713 respectively, or an increase of 6,644,997 for the two-year war period ended June 30, 1916. Correspondingly the war period exports of leather, shoes, etc., were for 1915 valued at \$120,727,156, and for 1916 at \$146,613,815, as compared with \$63,893,351 in 1913 and \$57,466,261 in 1914, or an increase of \$145,981,350 for the corresponding two war years, or 120.28 per cent, while the increase in the imports of hides amounted to 44.20 per cent. Such conditions naturally influenced hide prices in 1916 and the market for both Chicago packer and country hides made new records, with a maximum average in December of 33.33 for heavy native steers at the packers' and 26.63 for the same line of country hides, with calf skins reaching a figure of 54.17 and kipskins 35.66. The accompanying table indicates the comparative values by years. In leather, hemlock sole leather during the year increased from 32 to 58 cents; oak sole leather from 54 to 88 cents; belting butts from 76 to 89 cents; Union sole leather from 52 to 85 cents; chrome tanned side leather of dull black finish from 28 to 55 cents; colored calf skins from 36 to 85 cents; black calf from 34 to 75 cents; and in similar proportions throughout the list.

army shoes did not last over a month in field service and other leather goods in the same proportion. In both belligerent and neutral countries the governments were forced to act to supervise the leather industry and trade. In Denmark the export of raw horse hides, horse hair, and cow hide was prohibited, while in Switzerland the leather trade and especially the shoe factories were placed under the control of the Department of Agriculture and the War Office, with power to fix maximum prices and to issue regulations to tanners. By issuing licenses the government endeavored to enable merchants and manufacturers to buy at fair prices, and the withholding of stocks was prevented. In Germany, owing to the absence of foreign sole leather hides, there was a dearth of sole leather, all existing stocks being held for the army, and various substitutes were employed. Pig skins and deer skins were being worked into sole leather and thin splits were being pasted together with a thin piece of grain leather to form a substitute that was said to be fairly waterproof. For upper leathers Germany was better off, as raw calf skins were being imported from Holland. There was less kid than was needed, while all harness leather was being taken by the military authorities. There was a serious scandal in the government institution which looked after the requisition and the division of hides among manufacturers, one of the officials having been bribed to show favoritism in the selection of hides. In Russia tanning and boot manufacturing industries were being organized and supervised under the direction of an imperial councillor in order to work up the raw

The leather situation in Europe involved not only the demand for boots and shoes, harness, and other equipment for vast armies, but a constant destruction of this material and a lack of sources for its replacement. As an indication of this vast destruction it was said that

material of the Empire. An embargo was placed upon exports but in 1916 750,000 calf skins were shipped to the United States in exchange, it was said, for sole leather. American imports, especially leather, were securing a good foothold in Russia. In Great Britain at the end of the year

it was announced that the Army Council intended to requisition all leather in a series of specified schedules which included vegetable tanned bends, butts, and backs of certain requirements, chrome tanned bends, butts, and backs of specified substance, kip and vegetable, and other upper leathers. See **BOOTS AND SHOES**.

**LEAVITT, ERASMUS DARWIN.** An American mechanical engineer, died at Cambridge, Mass., March 11, 1916. He was born at Lowell, Mass., in 1836, and was connected with various engine works in New England until 1861, when he became an assistant engineer in the United States navy. He served throughout the Civil War and until 1867, when he returned to private practice. Perhaps his most important work was done as consulting engineer of the Calumet and Hecla Mining Company from 1874 till his retirement 30 years later; he designed the machinery in use at the Hecla Mine. In addition, Mr. Leavitt was consulting engineer to the cities of Boston and New York. Equipment designed by him was installed by the Bethlehem Steel Company and by South African mining concerns. Besides holding membership or honorary membership in many scientific societies, he was president of the American Society of Mechanical Engineers in 1883.

**LEE, SIR SIDNEY.** See **LITERATURE, ENGLISH AND AMERICAN, Works of Reference, etc.**

**LEeward ISLANDS.** The Leeward Islands (so called in contrast to the Windward Islands, which are most exposed to the N. E. Trade, the prevailing wind in the West Indies) form the most northerly group of the Lesser Antilles, the whole of which are included among the Windward Islands as the term was used by the Spaniards. Some of them belong to Denmark (part of Virgin Islands), Holland (St. Eustatius, Saba, a part of St. Martin), France (Guadeloupe, Martinique, St. Bartholomew, and part of St. Martin), and the United States (Vieques and Culebra). The English Leeward Islands, composed of the presidencies of Antigua (with its dependencies, Barbuda and Redonda), Montserrat, St. Kitts and Nevis (including Anguilla), Dominica, and the Virgin Islands, were constituted a single federal colony by an act passed in the Imperial Parliament in the session of 1871. The total area of the colony is 704 square miles, and its population about 131,964. The island of Sombrero was added to the colony by order in council under the Colonial Boundaries Act, on Aug. 10, 1904.

The table below gives area in square miles, population (1911), imports and exports for 1914, revenue and expenditure for 1914-15, of Antigua (A), Montserrat (B), St. Kitts and Nevis (C), Dominica (D), and the Virgin Islands (E):

	Sq. m.	Pop.	Imps.	Exps.	Rev.	Exp.

E	58	5,562	9,081	6,905	4,903	5,554

**LEGISLATION IN 1916.** This article is intended to cover the most important legislative measures passed by the State legislatures in 1916. Federal legislation is covered in the section *Congress*, article **UNITED STATES**, and in other articles dealing especially with the sub-

jects to which the measures relate, as **BANKS AND BANKING, RAILWAYS, TAXATION, TRUSTS, etc.** See also **LABOR LEGISLATION**.

Regular sessions were held during the year in Georgia, Kentucky, Louisiana, Maryland, Massachusetts, Mississippi, New Jersey, New York, Rhode Island, South Carolina, and Virginia. Special sessions to consider emergency consideration were held in California, Illinois, Oklahoma, South Dakota, and Tennessee. In the regular sessions in the several States there were introduced over 15,000 bills; the majority of these, however, failed to become a law. The most important measures from a national standpoint are noted in the following subdivisions.

**ADMINISTRATION OF JUSTICE.** The Mississippi Legislature inserted in the State constitution amendments adopted by the people in November, 1914, increasing the number of Supreme Court judges to six, requiring them to be elected by the people, and fixing their term at eight years. In Massachusetts the criminal and civil jurisdiction of district courts or municipal courts was so extended that their process runs throughout the State, and makes them courts of superior and general jurisdiction. In Virginia court clerks are authorized to appoint as deputies women over 21. In Georgia also the civil code was amended to make women eligible as clerks. A juvenile court was created in Maryland in any county where all the judges of the circuit deem it necessary. In Mississippi a constitutional amendment adopted in 1914 was inserted in the constitution permitting the Legislature to provide that in all civil cases in circuit or chancery courts nine or more jurors may return a verdict. In Maryland it was provided that a jury may add to a first degree murder verdict the words "without capital punishment," in which case the courts shall impose a life sentence and not a death penalty. Practically the same legislation was passed by the Legislature of New Jersey. In Mississippi public hangings are prohibited. In Massachusetts the board of prison commissioners was abolished and a bureau of prisons created instead.

**ORGANIZATION AND ADMINISTRATION OF STATE GOVERNMENTS.** The budget system was established in New Jersey. This requires the Governor to make his recommended appropriations on the basis of estimates submitted by the departments. All appropriations are required to appear in the general appropriations bill. The New York Legislature also provided the budget system, which required the Governor to submit recommended appropriations and authorizes him to submit estimates of revenue. The Maryland Legislature proposed a constitutional amendment which would put the finances of the State on a budget system. (See **MARYLAND**.) In Louisiana a board of State affairs was created. In New Jersey there was created a central purchasing agency controlled by the commission consisting of the Governor, treasurer, and comptroller, to purchase all supplies for State departments and offices, except for construction work. In Massachusetts the economy and efficiency commission was abolished and a supervisor of administration created instead. The Virginia Legislature created an economy and efficiency commission to investigate the possibility of a more efficient and economical organization and administration of the State and local governments. The Virginia Legislature proposed a constitu-

tional amendment authorizing the Legislature to submit to cities the choice of several forms of governments. City planning was provided for in Massachusetts.

**EDUCATION.** In New Jersey the conferring of degrees by any institution not licensed by the State Board of Education was prohibited. In New York there was incorporated an Institute for Public Service to conduct a training school to place men for the public service by doing field work in cooperation with public officials. In Mississippi there was created a uniform commission to study and eliminate adult illiteracy. A training school for delinquent children was also established. The Kentucky Legislature provided for a census paid illiteracy commission for adult illiteracy. In New Jersey appropriations were made for vocational education. In Massachusetts cities whose voters accept the act by referendum may establish day or night schools in agriculture or horticulture under the supervision of the board of education. In Maryland for the first time compulsory education was made State wide. Children between 7 and 13 must attend during the entire year. In Louisiana a compulsory school attendance law applying to children between 7 and 14 years of age was enacted. In Georgia the Legislature enacted a compulsory school attendance law requiring children between 8 and 14 to attend school, but making many exceptions. In Maryland the entire school system was reorganized. The act was drawn by a commission in cooperation with the Rockefeller Foundation. In Louisiana a State board of education was created.

Other legislation will be found noted under the articles **ELECTORAL REFORM; FOOD AND NUTRITION; LIQUOR REGULATION; MILITIA; TAXATION;** etc.

**LEHIGH UNIVERSITY.** A nonsectarian institution for the education of men at South Bethlehem, Pa., founded in 1866. In the fall of 1916 there was a total student enrollment of 775 and the faculty numbered 81. During the year there were no important changes in the faculty and no noteworthy benefactions. The productive funds of the institution amounted in 1916 to \$1,181,871. The library contains 140,884 volumes. President, Henry Sturgis Drinker.

**LELAND STANFORD JUNIOR UNIVERSITY.** A non-sectarian co-educational institution at Palo Alto, Cal., the post office address of which is Stanford University, Cal. It was founded in 1891 by Leland Stanford and his wife in memory of their son. The total number of students enrolled in all departments in the fall of 1916 was 2010. The faculty numbered 199. In January Dr. Ray Lyman Wilbur was transferred from the deanship of the Medical School to the presidency of the university, succeeding Dr. John Casper Branner, who retired as president emeritus. Dr. Albion W. Hewlett, of the University of Michigan, was appointed to Dr. Wilbur's former office, and Prof. Charles A. Huston was promoted to be dean of the Law School, in succession to Dr. Frederick C. Woodward, resigned. Chester G. Vernier, of the University of Illinois, became professor of law. To take the place of Dr. Oliver P. Jenkins, who retired, Ernest G. Martin of Harvard University was appointed to the chair of physiology. During the year also, Dr. David Starr Jordan retired as chancellor emeritus and Dr. Lillian J. Martin as emeritus professor of psychology.

Dr. Alvin S. Johnson, formerly professor at Cornell and an editor of the *New Republic* (New York), was appointed professor of political science. The principal benefaction of 1916 was a gift of \$80,000 made by Thomas Welton Stanford, trustee of the university, for the erection of an art gallery, nearly completed at the end of the year. Ground was broken for a new library building to cost about \$500,000, and work was begun on a \$500,000 hospital building to be connected with the medical school of the university, in San Francisco. During the year, military drill was established and made compulsory on students for two years of their course. Maj. Jens Bugge, U. S. A., retired, was appointed professor of military science and tactics. It was decided to maintain the university in continuous session throughout the year, which will be divided into four quarters. In productive funds, Leland Stanford has \$24,534,941, and in 1916 it had an income of \$1,031,069. On July 31, 1916, there were 276,251 volumes in the library.

**LEONARD, ADNA W.** See **METHODIST EPISCOPAL CHURCH.**

**LEPROSY.** Argentina is the latest country to come under notice as harboring considerable numbers of lepers, who are practically uncontrolled. Penna, chief of the National Public Health Service and professor at the University of Buenos Aires, says that there are no ordinances preventing lepers from traveling about and no institution in which to segregate them.

The House of Representatives on May 5th, passed house bill No. 103, an act to provide for the care and treatment of persons affected with leprosy, and to prevent the spread of leprosy in the United States, in which it asks the concurrence of the Senate. Illinois opened on May 22, 1916, a leprosarium on the grounds of the Watertown Hospital.

The diagnosis of leprosy has been shown by Neve to be made more certain, particularly in doubtful cases, by the X-ray. Examination by this agent demonstrated well the bony lesions, namely, a clubbing of the fingers, of which the terminal joint lacked symmetry. In the toes of Neve's case there was almost entire disappearance of the terminal phalanges of several of the toes.

Takane used a preparation of copper and potassium cyanide, called cyanocuprel, in six cases of leprosy, with what appeared to be beneficial results. See **TUBERCULOSIS.**

**LEBOY-BEAULIEU, (PIERRE) PAUL.** A French economist, died at Paris, Dec. 10, 1916. He was born at Saumur in 1843, was educated at Paris and at Bonn and Berlin universities, and afterward contributed to French publications. He was a firm believer in free trade. His first important book, *L'Influence de l'état moral et intellectuel des populations ouvrières sur le taux des salaires*, was published in 1867. He was appointed professor of finance at the Ecole Libre des Sciences Politiques in 1872, and professor of political economy at the Collège de France in 1880. In 1873 he founded the *Economiste Français*. He was made a member of the Legion of Honor and of the Academy of Political and Social Science, and received honorary degrees from several foreign universities. His works include: *La colonisation chez les peuples modernes* (1873); *Précis d'économie politique* (1888); *L'Etat moderne et ses fonctions* (1889);

*Traité théorique et pratique d'économie politique* (1895); *La Sahara, le Sudan et les chemins-de-fer transsahariens* (1904); *L'Art de placer et gérer sa fortune* (1906); *La question de population* (1913); *Première année de guerre: l'août, 1914—31 juillet, 1915* (1915).

**LEUKEMIA.** This form of anemia, characterized by an immense multiplication of the white blood corpuscles, is believed by Dias to be the work of a fungus, which he names *Adenomyces leukamiae*. Dias injected the blood and lymph of three patients into laboratory animals and all of them died, showing pathological lesions similar to those of human leukemia.

**LEVITZKI, MISCHA.** See **MUSIC, Artists, Instrumentalists.**

**LEVY-LAWSON, EDWARD.** See **BURNHAM, E. LEVY-LAWSON, first BARON.**

**LIBERIA.** An independent negro republic on the west coast of Africa, founded in 1822 by America philanthropists for the settlement of freed slaves. The area is variously estimated at from 35,000 to 41,000 square miles and has a population of between one and two millions, including about 10,000 Americo-Liberians. The indigenous negroes, with the exception of the Mandingo tribe (Mohammedan), are mainly pagans, and there are said to be cannibals in the interior. The development of the country is hindered by lack of roads, impassable forests, and by laws preventing the acquisition of land by any but Liberians or (until 1909) trading by foreigners in any part of the country excepting at official ports of entry. A concession obtained by Lever Bros., Ltd., embracing 12,000 square miles and intended to open up the country, was rejected by the Senate. The mineral wealth is unexploited except for the operation of a native company. The products for export are palm oil, coffee, rubber, and ivory. Cotton is indigenous but little cultivated. Imports, 1913, \$1,150,491; exports, \$1,112,187—palm oil and kernels, piassava fibre, coffee, rubber, and ivory.

Seventy per cent of the trade is with Germany. In 1914 vessels entered to the number of 371, of 845,901 tons. Monrovia (6000 inhabitants) is (since 1910) a cable station on the route from Germany to Brazil. The Government of French West Africa obtained permission to establish a wireless station there. The budget for 1913-14 balanced at \$531,500. Restriction of revenue due to the European war prevented the preparation of a 1914-15 budget. The debt stood, Dec. 31, 1914, at \$1,510,000; of which internal floating debt, \$200,000. A president (1912-16, Daniel Edward Howard) elected for four years is the executive.

**LIBERTY, STATUE OF.** See **ELECTRIC LIGHTING.**

**LIBRARY ASSOCIATION, AMERICAN.** The 38th annual meeting of the Association was held at Asbury Park, N. J., June 26th-July 1st. There were present 1386 members out of a total of more than 3100. Miss Mary W. Plummer (q.v.) was to have presided but an illness, which terminated fatally, prevented her from being present. Her paper on "The Public Library and the Pursuit of Truth" was read, and the titles of other papers were: "How the Community Educates Itself," by Arthur E. Bostwick; "Children's Books," by John Jay Chapman; "Democracy in Modern Fiction," by Mary Ogden White; "The New Poetry and Democracy," by

Jessie B. Rittenhouse; "Modern Drama as an Expression of Democracy," by Robert Gilbert Welsh; "Some of the People We Work For" (the foreigners of our large cities), by John Foster Carr; "Leadership Through Learning," by William Warner Bishop; "The Public Library as Affected by Municipal Retrenchment," by Frederick C. Hicks; "Possible Book Results of the European War," by Walter Lichtenstein; "Library Preparedness in the Fields of Economics and Sociology," by Adelaide R. Hasse; "Library Work with Children," by Henry E. Legler; "The Place of the School Library in Modern Education," by James Fleming Hosc; "Americanizing Books and Periodicals for Immigrants," by J. Maud Campbell; and "An Americanization Program for Libraries," by H. H. Wheaton.

The officers elected at the annual meeting were as follows: President, Walter L. Brown, Public Library, Buffalo, N. Y.; first vice-president, Harrison W. Craver, Carnegie Library, Pittsburgh, Pa.; second vice-president, George H. Locke, Public Library, Toronto, Canada. The executive board consists of these officers and in addition six other members. The secretary is George B. Utley, 78 East Washington Street, Chicago, and the treasurer, Carl B. Roden, Public Library, Chicago. Special committees, appointed or re-appointed for 1916-17, are studying among other things: Library extension in Europe after the war; expansions of the Decimal Classification; certification of librarians and standardization of libraries; investigation of insurance rates for books and library buildings and equipment; library publicity methods; library work in hospitals and charitable and correctional institutions; code of practice for inter-library loans; book-binding for libraries; library training; library administration; etc.

The American Library Association conferences are divided into a system of sections as follows: College and Reference; Trustees; Catalogue; Library Work with Children; Professional Training; Agricultural Libraries Section; School Libraries Section.

Four national organizations are affiliated with the American Library Association: National Association of State Libraries; League of Library Commissions; American Association of Law Libraries; and Special Libraries Association.

The Publishing Board of the Association publishes the *A. L. A. Booklist* (edited by May Massee) and the official *Bulletin*, and also, in 1916, put out *Brief Guide to the Literature of Shakespeare*, by H. H. B. Meyer; *Lists of Material Which May be Obtained Free or at Small Cost*, by Mary J. Booth; *Subject Headings for Use in Dictionary Catalogs of Juvenile Books*, by Margaret Mann; *Selected List of Russian Books*, compiled by J. Maud Campbell; *Recent French Literature: An Annotated List of Books Recommended for Libraries*, by Sarah Graham Bowerman; *Manual for Libraries in Hospitals, Prisons, Reformatories, and Other Institutions*, by Carrie E. Scott; *Collection of Social Survey Material*, by Florence R. Curtis; *List of Books on Scientific Management*, by C. Bertrand Thompson; and a new edition of the *Handbook of the League of Library Commissions*, edited by Henry N. Sanborn.

**LIBRARY BUILDINGS.** See **ARCHITECTURE; LIBRARY PROGRESS.**

**LIBRARY OF CONGRESS.** The library contained, at the close of the fiscal year 1916, 2,451,974 books, a gain of 88,101 over 1915; 154,200 maps and charts, a gain of 6647; 770,248 volumes and pieces of music, a gain of 42,440; and 392,905 prints, a gain of 7148. There was a considerable decrease in the net accessions as compared with 1915. This was accounted for in part by the practical closing of the sources of supply in continental Europe and in part by unusually large deductions of material through consolidation in binding and through exchanges, transfers, and returns. The eliminations, though considerably above the average of recent years, were greatly exceeded in 1906, 1908, and 1909. While no considerable collection of books was received by gift, the aggregate of gifts from thousands of sources—private, corporate, and official—reached the considerable total of 28,285 volumes. Among these may be mentioned *The Collection of Arms and Armor of Rutherford Stuyvesant, 1845-1909*, by Bashford Dean; a copy of *The Royal Commission on the Losses and Services of American Loyalists, 1785-1785*, from Mrs. Whitelaw Reid; a set of *Japanese Temples and Their Treasures*, consisting of portfolios of plates, with text, from Mr. H. Yamawaki, Commissioner-General of Japan to the Panama-Pacific Exposition; a fine copy of his work entitled *L'armée du duché de Varsovie*, from the artist Jan V. Chelminski; and a number of books in the Hindi language, given on behalf of the Nagri Pracharni Sabha, a literary research society in Benares. Mr. P. Lee Phillips, Chief of the Division of Maps and Charts, gave a valuable supplement to Cushing's *Initials and Pseudonyms*, in five folio manuscript volumes, the result of many years of research by the giver. Dr. Walter T. Swingle, of the Bureau of Plant Industry, added to the East Asiatic collections of the library by the purchase of 271 Chinese works, 176 Japanese works, 3 Korean works, 2 sets of Chinese and 9 sets of Japanese periodicals. The accessions in the manuscript division in 1916 had kept up well with the average of recent years, both in volume and importance. Among them may be mentioned such collections as the papers of Alexander Hamilton, General Sumter, W. L. Marcy, J. C. Bancroft Davis, S. F. B. Morse, and others.

**LIBRARY PROGRESS.** The year 1916 was not marked by any unusual undertakings or great events in the library world. The continuance of the European war prevented the execution of any international bibliographical work, and the difficulty of importing books from central Europe diminished to a marked degree the annual additions to most libraries of the scientific and research type.

**LIBRARY BUILDINGS.** The extreme prosperity of the United States and the resultant cost of materials delayed several important buildings, chiefly the new structures for the Brooklyn Public Library and the John Crerar Library of Chicago. Cleveland's \$2,000,000 bond issue for its Public Library building has at last become available by a court decision, and a competition has been held to select an architect. This library is to form part of the notable group of city buildings on the lake front.

**LIBRARY LEGISLATION.** Only a small number of State legislatures were in session in 1916, and

an unusually small amount of general library legislation was passed. New York "exempted from taxation all real estate owned by a free public library situated 'outside of a city,' the income from which is needed and used for the purposes of the library." A bill, however, exempting from taxation all the property, real and personal, owned by a public library was defeated, as a similar bill had been before.

**LIBRARY LITERATURE.** Among the important publications of the year were the various classification schedules of the Library of Congress. The greater portion of the classification scheme of this library is now in print, with adequate indexes to the several parts. The remaining classes should be out in 1917, when a complete index to the whole classification should be a possibility. The 1916 report of the Librarian of Congress notes libraries which have adopted this scheme of classification despite difficulties due to its incomplete state.

The Virginia State Library issued Mr. Earl G. Swem's *Bibliography of Virginia*, part I, one of the most valuable bibliographies of recent years. This is the first of four volumes. The New York Public Library performed a distinct service in reprinting the report made at the Berkeley Conference of the American Library Association on *Library Facilities for the Blind in the United States*. Perhaps the most valuable technical contribution of the year was Arthur L. Bailey's *Library Bookbinding* (White Plains, N. Y., H. W. Wilson Co.). Mr. Bailey has been for several years the chairman of the Library Association's committee on binding, and has embodied in this book the results of his labors in a trying and difficult field.

The Shakespeare tercentenary produced a crop of bibliographical works on that poet, among which the best was H. B. Meyer's *Brief Guide to the Literature of Shakespeare* (Chicago, A. L. A. Publishing Board). The Bodleian Library of Oxford University and the New York Public Library issued valuable catalogues descriptive of exhibits of Shakespeare material.

Perhaps the most important change in policy occurring during the year was the decision of the British Museum to print a much larger edition of its *Catalogue of Accessions* and to sell the publication for a moderate sum (£3 per year). This opens up to the whole library world a record previously published only in some 40 copies and available only to certain very large libraries.

Of more general interest was the publication of Mr. John C. Dana's collected addresses and essays under the title *Libraries* (White Plains, H. W. Wilson Co.). This volume contains a series of stimulating public addresses, beginning with the author's presidential address before the American Library Association in 1896. The relations of libraries and schools were presented from a local, but fairly typical, point of view in the brochure by Mr. L. P. Ayres and Miss A. McKinnie, *The Public Library and the Public Schools*, published in the Cleveland Education Survey. For the use of high school students, Miss F. M. Hopkins published *Reference Guides* (Detroit, Willard Co.), and Mr. L. O. Wiswell, *How to Use Reference Books* (New York, American Book Co.). Miss Corinne Bacon brought out two lists of books for children, one of 1000 titles, and the other of 2000 (White Plains Wilson Co.).

**NECROLOGY.** Shortly after the completion of her term of office as president of the American Library Association, Miss Mary W. Plummer died. She was easily the foremost woman in library work, having been for many years director of the Pratt Institute Library School, and for five years before her death, principal of the Library School of the New York Public Library. Dr. John Thomson, the veteran head of the Philadelphia Free Library, and Prof. J. C. Schwab, librarian of Yale University, were also among the year's losses by death.

**AMERICAN LIBRARY ASSOCIATION.** The annual conference was held late in June at Asbury Park, N. J., and was the largest in point of attendance in the association's history. The programme emphasized the service of libraries in a democracy. The proceedings have been published by the Publishing Board (Chicago, 78 E. Washington Street). See **LIBRARY ASSOCIATION, AMERICAN.**

**LIBYA.** An Italian possession on the Mediterranean coast of Africa, composed of Tripoli and Cyrenaica, both under a common governor (since July 15, 1916, Lieut.-Gen. Giovanni Ameglio). The area is estimated at 405,800 square miles, and the population at about 1,000,000. The city of Tripoli, with 75,000 inhabitants, is the capital of Tripoli; Bengazi, with 30,000, of Bengazi; both Mediterranean ports.

Railways are building, but the trade is mostly by the great caravan routes. Imports are reported for 1913 at £1,021,340 and exports at £137,101. Colonial revenue for 1915-16 was estimated at 15,100,300 lire; state contribution, 44,221,100; extraordinary, 2,250,000—total, 70,896,000 lire. Civil expenditure, 19,393,200; military, 39,928,206; extraordinary, 11,525,300—total, 70,896,700. The treaty of Ouchy provides for the retention by the caliph of religious authority.

**LIGHTHOUSES.** The number of aids to navigation maintained by the United States Lighthouse Service on June 30, 1916, as compared with 1915 is given in the accompanying table:

Class	Total June 30	
	1915	1916
<b>Lighted aids:</b>		
Lights (other than minor lights) . . .	1,661	1,706
Minor lights . . . . .	2,887	2,920
Light-vessel stations . . . . .	58	58
Gas buoys . . . . .	479	512
Float lights . . . . .	124	182
Total . . . . .	5,154	5,825
<b>Unlighted aids:</b>		
Fog signals . . . . .	527	532
Submarine signals . . . . .	50	52
Whistling buoys, unlighted . . . . .	86	88
Bell buoys, unlighted . . . . .	287	288
Other buoys . . . . .	6,488	6,659
Day beacons . . . . .	1,993	2,060
Total . . . . .	9,381	9,624
<b>Grand total . . . . .</b>	<b>14,535</b>	<b>14,947</b>

During the fiscal year ended June 30, 1916, there was a net increase of 412 in the total number of aids to navigation maintained by the Lighthouse Service, including 45 lights above the order of minor lights, 5 fog signals, 2 submarine

bells, 67 daymarks, 33 lighted buoys, 171 unlighted buoys, and 91 minor lights (including 7 float lights). The Commissioner also reported that at 49 stations fixed lights were changed to flashing or occulting lights, and that oil vapor light was installed as an illuminant for 19 lights, acetylene for 44 lights, including two light vessels, and incandescent electric lights were substituted at 13 lights. New fourth-order light stations, each with fog bell, were placed at Rondout North Dike, Hudson River, N. Y., and at Point au Fer Reef, Atchafalaya Entrance, La. In the place of the light-vessel formerly placed at Shovelful Shoal, Nantucket Sound, Mass., a light-vessel was placed at Stone Horse Shoal in the same locality. An important event of the year was the completion of the system of lighted aids in the channel leading to Baltimore, Md.

The work of the Lighthouse Service in Alaska continued, and the total number of aids to navigation on June 30, 1916, was 388, as compared with 338 in 1915. This total included 147 lights, or an increase of 110 lights since June 30, 1910. An important work in Alaska reaching completion in 1916 was the Cape St. Elias lighthouse and fog signal, for which Congress appropriated \$115,000 in 1913. The Cape St. Elias lighthouse is a concrete and hollow tile structure with a double flashing white light and a powerful fog signal. The complete parapet deck, watch room, and helical bar lantern, a massive metal structure, alone some 29 feet in height and weighing about 44,000 pounds, previous to their installation formed a part of the exhibit of the United States Lighthouse Service at the San Francisco Exposition of 1915.

**LINTON, SIR JAMES DROMGOLE.** An English painter, died at Haverstock Hill, Oct. 3, 1916. He was born in 1840 in London. His studies at St. Martin's Art School were supplemented by further training under Leigh. Especially in the field of water-color painting he achieved a leading place among the artists of his time. The South Kensington Museum, London, possesses a series of his productions in this medium. He served as president of the Royal Institute of Painters in Water Color from 1884 to 1889 and from 1909 to his death, and as honorary president of the Royal Society of Miniature Painters; and he was honorary or corresponding member of other art societies. Linton was knighted in 1885 and received the Jubilee Medal in 1897. Besides his water-colors, he was known for genre, historical, and decorative paintings in oil.

**LIQUOR REGULATION.** On Jan. 1, 1916, in seven States the prohibition of the sale of intoxicating liquor either by statute or by laws enforcing constitutional amendments went into force. These States were Iowa, Colorado, Oregon, Washington, Idaho, Arkansas, and South Carolina. Local option laws were already in force, but this was now succeeded by State-wide prohibition. In these seven States more than 3000 saloons, breweries, wholesale liquor houses, and distilleries went out of business. This addition brought the total number of States under prohibition to 18. The law which went into force in Idaho was especially drastic. It

PROHIBITION IN THE UNITED STATES

William Engeling Co., N. Y.

makes the possession of spirituous or malt liquors a crime, exception being made in the case of wine for sacramental purposes, and pure alcohol for use in medicine or scientific work. A court order, however, is necessary for obtaining wine or alcohol for these purposes.

The inauguration of a new law ended the dispensary system in South Carolina. This system was in force in 15 of the 44 counties of the State. In this State individuals are permitted to obtain by shipment one gallon of spirituous liquor each month. The Washington law permits residents to buy from dealers outside of the State two quarts of spirituous liquor or 12 quarts of beer every 20 days. In Oregon drug stores are not permitted to sell liquor with or without a doctor's prescription, but in any period of four weeks a family may import two quarts of spirituous liquors or 24 quarts of malt liquor for personal use.

Nearly all the legislatures in session in 1916 enacted measures affecting liquor regulation. In some cases the existing enactments were strengthened, and in others provision was made for submitting the question to the people in the November election. The Legislature of Georgia added amendments to the law, which had already been amended in 1915, providing for a more rigorous enforcement of the prohibition laws. The amendments of 1916 regulated the shipment and receipt of limited quantities of liquor. They also authorized the importation of alcohol for use in manufacturing articles of commerce, and provided regulations in reference to such importations. The Virginia Legislature enacted a comprehensive prohibition law forbidding the manufacture, sale, advertisement, etc., of liquors, creating the office of commissioner of prohibition for its enforcement, and in various ways including a simple form of indictment, liability for damages done by intoxicated persons, etc., to discourage the violation of its provision, providing also for local option on the question of permitting intra-State or interstate shipments. The Mississippi Legislature made liquor advertisements criminal, and also authorized injunctions to restrain them. It also forbade the transportation into the State or reception therein of liquors contrary to law. The penalties and provisions for the enforcement of these laws are very rigorous. The Kentucky Legislature regulated licensed liquor dealers, and forbade screen or other obstruction interfering with the full view from the street of rooms where liquor is sold. In Louisiana the Legislature prohibited the keeping or selling of malt liquor whether or not intoxicating or containing alcohol in municipalities where the sale of intoxicating liquor is prohibited. It also made it unlawful to ship or carry any vinous liquors into any portion of the State where the sale of such liquors is prohibited by law or ordinance except as provided in this act. In South Carolina it was made a misdemeanor to sell any formula or distilling apparatus for making intoxicating beverages except those containing less than 2 per cent alcohol or preparation for medicinal purposes.

As a result of the election on November 7th, four additional States voted for prohibition, Michigan, Montana, South Dakota, and Nebraska, making in all 23 States under prohibition laws at the end of 1916. In addition to this the Legislature of Utah will doubtless for-

mulate a prohibition law early in 1917, as the Governor and Legislature practically pledged to this enactment were elected. The same condition applies to Florida, where the Governor and Legislature pledged to prohibition were elected in November. The votes of Colorado, Oregon, and Washington defeated beer amendments of November 7th, and in Arkansas and Arizona proposals for licensing were defeated. At the end of 1916 there were but six States west of the Mississippi where liquor could be sold. These were Missouri, Texas, New Mexico, Wyoming, Nevada, and California. Missouri and California were saved from voting prohibition on November 7th only by the votes of their largest cities, St. Louis and San Francisco. Indications point to Texas, Ohio, Indiana, and Minnesota as likely to vote for prohibition within a year.

Even in the States which are nominally under license or local option, there are large sections where liquor cannot be sold. California is largely dry, and Indiana, Kentucky, Louisiana, Minnesota, Missouri, New Hampshire, Texas, and Vermont are from 50 to 90 per cent dry.

The movement for prohibition by constitutional amendment continued to be agitated in 1916, and although no definite action was taken by Congress, it was generally conceded that such an amendment would again pass the Lower House, and had strong possibility of passing the Senate. One of the most important instances of the year as relating to the enforcement of prohibition was the action of the Supreme Court in declaring constitutional the Webb-Kenyon law, which prohibits the transportation of liquor into prohibition States through interstate commerce.

**LIQUORS.** The course of events during the year 1916 did not tend to raise the gloom which had been gradually overcasting the liquor industry and situation in either the United States or the world at large. In the United States five more States were voted "dry," Michigan, Montana, Nebraska, South Dakota, and Utah—making the total number of prohibition States 24, with an approximate population of 32,500,000. California and Missouri voted "wet," as did the city of Boston after a particularly vigorous fight. As the year closed a constitutional amendment was introduced in Congress for national prohibition, and Senator Sheppard's bill for prohibition in the District of Columbia without a referendum had strong support. The prohibition forces felt that they were coming into their own; the "antis" while downhearted, seemed not to be discouraged, feeling that history would only repeat itself; calling attention to the period from 1857-60 when about the same proportion of the country went "dry," but the pendulum swung back. The Commissioner of Internal Revenue in his report for 1916 stated that there had been no abatement in the illegal sale of liquors by "bootleggers" in the various States and localities where prohibition laws exist. In view of the progress of prohibition the leaders in Congress were making plans to provide revenue to take the place of the one hundred and thirty odd millions of dollars annually collected from the tax on distilled spirits.

Congress repealed the War Emergency Act on wines, etc., and passed an act defining wine and legalizing the fermentation of a solution of sugar added to the must to correct natural deficiencies, to the extent of 35 per cent of the must used, and allowing the addition of sugar

to a dry wine, and the fortification of this product. The new law placed a graded stamp tax on vermouth and imitation wines in proportion to the percentage of alcohol contained up to 24 per cent, beyond which the product was classed as distilled spirits.

It was difficult to ascertain the exact situations abroad. The French Chamber of Deputies seriously was considering the abolishment of the alcohol industry. Russia had so far modified its recent and severe decrees as to allow the making of a small quantity of liquor. The revenues from the manufacture and sale of vodka (the national beverage) dropped from \$500,000,000 to about 4 per cent of that sum. Where drunkenness was the rule it is now the exception. In Great Britain, the restriction in the hours of sale seems to have made but little difference in the quantity sold.

**WINES.** The vintage in France in 1916 was expected to be about three times larger than in 1915, and the quality fair. As would be expected, conditions in this war-stricken wine country were far from satisfactory. The wines could not be given the proper attention on account of the scarcity of labor, and after the harvest the uncertainty of shipping facilities, by reason of the governmental use of the railroads, resulted in the spoiling of many tons of grapes and hogsheads of wine. Prices were firm, because the reserves are almost negligible. In Italy the estimated production of wine was 1,030,264,800 U. S. gallons, about twice as large as in 1915 but less than the average. As the reserve stocks had been depleted there was a very active demand for the 1916 vintage. In Spain and Portugal the situation had prospered considerably during the last year, due to the fact that France was expending her activities in another direction. As both countries produce far more than they consume, prosperity depends largely on the export demand. Spain exported to France five times as much red wine, and to France and England about twice as much sherry as in 1915. In Portugal the value of the exports of white and red wines almost trebled during the year. In some instances brandy sold for prices five times as high as in 1914. Crop reports from Spain indicated an excellent yield of good quality. The indications for Portugal were for a vintage larger than 1915, probably the largest on record.

**American Wines.** In California the sweet wine vintage was thought probably to be above the average of recent years, and the dry wine

**FERMENTED LIQUORS.** The following table shows the production and per capita consumption of fermented liquors in the United States for the years 1915 and 1916:

Year	Bbls. Beer	Per capita Gallons	No. of Breweries	Retail Dealers
1915	59,808,210	18.24	1,845	18,740
1916	58,688,624	....	1,818	12,716

The production decreased about 2 per cent—a very small reduction in consideration of the increased number of States which are supposedly “dry.” Many of the breweries which were forced out of business were producing the so-called near-beer, a product which when it contains less than 0.5 per cent alcohol is not called a fermented liquor by the Bureau of Internal Revenue. An enormous amount of this product was being sold, the supervision of which entailed considerable expense and annoyance to the Bureau of Internal Revenue, as it was a frequent occurrence for real beer to be sold by the retail in bottles bearing the near-beer label.

Figures were lacking as regards the beer production in Germany, but it would hardly fail to be less than in 1915, on account of the scarcity of grain and the requisitions for the army. It was reported at the end of the year that “beer cards” soon would be issued, limiting the amount to be consumed by each holder. In many places the size of the glass had been reduced, while the price had trebled. In Munich beer was only served for two hours mid-day and three hours during the evening.

The Society Islands had established their first brewery, and Egypt was producing all the beer the population could consume—in 1916 about 3,430,000 gallons.

**DISTILLED SPIRITS.** The following are the amounts in proof gallons produced and consumed in the United States during 1915 and 1916:

Year	Produced proof gallons	Tax paid for consumption	Per capita consumption
1915	140,656,108	124,155,178	1.25
1916	253,288,278	186,226,568	...

The spirits bottled in bond were as follows:

1915	9,748,978 proof gallons
1916	12,578,452 proof gallons

The comparative statistics of denatured alcohol for 1915 and 1916 are given herewith:

Fiscal year	Number of denaturing warehouses	Completely denatured	Specially denatured	Wine gallons	Total Proof gallons
1915	23	5,386,646.96	8,599,821.81	13,986,468.77	25,411,718.8
1916	33	7,871,952.82	38,807,153.56	46,679,106.88	84,532,253.1

less than the average. When the vintage is over, however, these forecasts may not prove true, as the new wine law gives the vintner the privilege of making a sweet wine out of a dry wine by adding sugar—and, if the grapes are naturally deficient, about 25 per cent of water may be added to the must. The vintage in New York and New Jersey was probably about normal. In Ohio and Missouri advantage was taken of the new law and about 35 per cent more “wine” might be expected than the normal production.

The number of retail dealers in the United States were as follows: 1915, 190,469; 1916, 184,718.

It is evident that prohibition is not decreasing the output of the distilleries, as 1916 was a banner year, about 12,000,000 more gallons being taxpaid than in the year preceding. The market was firm throughout the year, spirits selling for a higher price than for many years, due to heavy demands for alcohol, not only from Europe and South America, but for use in the manufacture of explosives in the United States.

None of this industrial alcohol paid any revenue to the government, that used in the United States being denatured and that exported being tax free.

Several whiskey distilleries were either entirely converted into spirit houses or ran part of the time on the production of alcohol for "war orders." The figures given for denatured alcohol are abnormal, as over 50 per cent of the total was used in the manufacture of explosives.

**LISTER, ERNEST.** Relected Democratic Governor of Washington Nov. 7, 1916. See WASHINGTON.

**LITERATURE.** See articles on French, German, Italian, Russian, Scandinavian, and Spanish Literatures; also LITERATURE, ENGLISH AND AMERICAN.

**LITERATURE, ENGLISH AND AMERICAN.** Again in 1916 the war cast its shadow over all the fields of English literature, and left its marks, too, upon not a few works of American literature. During the year, the English-speaking world showed a growing interest in serious books, somewhat to the detriment of fiction, serious and other, and especially in historical books bearing upon the present conflict. The increasing demand for books indicated a return towards normal reading habits, even in the face of a still absorbing preoccupation with the news from the front. Once more in 1916 writers of

fall properly within this survey, are duly noted below.

In fiction, most of the best living English and American novelists were active. The average of quality was good, but few works of commanding importance appeared on either side of the sea. War novels abounded, but were on the whole disappointing. The widespread tendency of the novelists to grapple seriously and to practical purpose with social problems was a pronounced characteristic of fiction in 1916. Deeper seriousness and sincerity, and steadier, more sustained, and more successful attempts at the interpretation of American life would seem progressively to mark the development of the novel in the United States. Both English and American letters sustained a great loss in the death of Henry James (q.v.). The poets in the last few years have been heard with increasing enthusiasm, and in the year 1916 there was certainly no abatement in the cordial reception of poetry. Despite the war, the contributions in the fields of the essay, literary criticism, history, biography, and travel were generous in quantity, and often excellent in quality. A great body of scholars and men of letters continue to pursue their labors.

The following comparative statistics, which appeared in the *Publisher's Weekly* for Jan. 27, 1917, are of interest as an indication of the preferences of the reading public:

RECORD OF AMERICAN BOOK PRODUCTION FOR 1916 \*

\* These figures include pamphlets, of which 1941 were recorded in 1916: 1532 in 1915.

distinction in all branches of literature were moved to express, each in his chosen form, their thoughts and feelings about the struggle, and the works of such authors, or such of them as

**FICTION.** *English.* Novelists whose earlier achievements entitle them to special attention have not been idle. Joseph Conrad offered tales of the Eastern seas and exotic isles and

shores, published as *Within the Isles*. H. G. Wells's *Mr. Briling Sees It Through*, if not one of its author's best novels, may still advance a good claim to being second to none of the novels due directly to the war. *The Lion's Share*, telling of the adventures of a naïve young heroine, suddenly become an heiress, was Arnold Bennett's contribution to the fiction of 1916. By virtue of its style and its beguiling narrative interest, and as a curious literary expression of the personality of its author, George Moore's *The Brook Kerith* is one of the most notable novels that falls within the bounds of this review. It is Mr. Moore's account in the form of fiction of the life of Christ, in which the teachings of Christ are expressed in terms of the author's easy-going naturalism—an account true neither to the letter nor the spirit of the Gospels, and by no means void of offense to the orthodox, the reverent, and the scholarly. W. J. Locke, with his commonplace and melodramatic novel *Viviette*, sank far below the level of his best; nor did he reach that level in his *The Wonderful Year*, which tells of a young Englishman's experiences in France, and gives a glimpse of the great war. Mrs. Ward added *Lady Connie* to the list of her achievements in fiction. Out of fragments of a story discovered among the papers of her father, Charles Kingsley, his daughter, "Lucas Malet" (Mrs. Mary H. St. Leger Harrison) composed a novel entitled *The Tutor's Story*, concerned with English country life in the 1830's. In addition "Lucas Malet" published *Damaris*, which presents Anglo-Indian life in the 'sixties of the last century. May Sinclair, in *The Belfry*, told the story of a perfect lady who with difficulty reconciles herself to her "bounder" husband. Eden Phillpots turned from the potteries and slate quarries of his recent novels to the hop-fields: of life there his *The Green Alleys* is a transcript. Maurice Hewlett, in the tortured style that attracts one and repels another, told a tale of married life entitled *Love and Lucy*. Canon Hannay ("George A. Birmingham"), in his latest novel, *Gossamer*, made a great financier his hero, and concerned himself with problems of international finance. Eden Phillpots made the schoolboy his hero in *The Human Boy and the War*, and E. F. Benson chose school life as a setting for his *David Blaze*, a study of boy friendship of rare sincerity and insight. Mr. Benson also wrote a somewhat incongruous blend of village comedy and serious romance entitled *The Oakleyites*. From J. D. Beresford, author of the Jacob Stahl trilogy, came *These Lynnekers*, a novel of which the critics speak handsomely. Archibald Marshall, in *Watermeads*, again dealt with a transition stage of country life.

Abounding in travel-description is Frank Harris's entertaining story of a gentleman chauffeur and a fair heroine, entitled *Love in Youth*. W. Pett Ridge's *The Kennedy People* is an unvarnished realistic tale of every-day English people. Miss F. Tennyson Jesse, a grand-niece of the poet from whom she takes her middle name, would probably have somewhat startled her great-uncle with certain of the stories—tales of terror and tales of an erotic tinge, published as *Beggars on Horseback*—had that poet been fated to peruse them. There is good entertainment to be had from the finely told stories in Barry Pain's *Collected Tales*. In Sylvia Lind's *The Chorus* is met one of those philandering gen-

uses to whom fiction nowadays is so partial. W. E. Norris wrote a quiet, well-bred, leisurely novel of English life entitled *Troubled Tranton*. Dartmoor is again the scene of a new story by John Trevena, *A Drake by George*. In E. V. Lucas's *The Vermilion Bow*, love, war, and a family chronicle are blended. Algernon Blackwood was again in his favorite field of the mystical-supernatural with *Julius Le Vallon*. Horace Annesley Vachell was represented by *The Triumph of Tim*; Viola Meynell by *Narcissus*; Gilbert Cannan by *Three Sons and a Mother*; Warwick Deeping by *Bridge of Desire*, a study of marriage and the sex question; Maxwell Gray by *The World-Mender*; Charles Marriott by *Davenport*; and Coningsby Dawson by *Slaves of Freedom*. That John Masefield the novelist is not on a par with John Masefield the poet was attested by the novel *Multitude and Solitude*, where the scene shifts from London to the African jungle and back again, and by another novel noted below. The late Mrs. Frankau—"Frank Danby" (q.v.)—ended her literary career with *Twilight*, a morbid but impressive story. The tragedy of a man who married "beneath him" was strongly presented by W. L. George in *The Stranger's Wedding*. In Ethel Sidgwick's *The Accolade* there is a good love story and keen psychological analysis, and in her *Hatchways*, a story of English country life, dextrous structure and brilliant writing are distinctive features. Canada came into the year's fiction with Sir Gilbert Parker's *The World for Sale*, and Australia with a prize-winning novel *The Pioneers*, by Katharine S. Prichard. From the Malay Peninsula Sir Hugh Clifford gathered material for the vivid stories in his *The Further Side of Silence*. Edward C. Booth's *Fondie* is a story of a Yorkshire town, and Miles Lewis's *Chapel* a tale of Welsh country life.

John Masefield's *Captain Margaret* is a romance of the Spanish Main in the seventeenth century. A story with scenes on land as well as on the sea, and a notable novel of the year, is William McFee's *Canales of the Sea*. J. C. Snaith, in *The Sailor*, develops a rude, unlettered sailor into a literary master; and Edward C. Noble in *The Bottle-Fillers* endeavors to show what is wrong with the British merchant marine. A group of the year's authors chose themes bound up more or less with feminist problems. A woman shattering conventional standards is at the centre of "J. E. Buckrose's" (Mrs. Falconer Jameson's) *The Roundabout*; an insurgent feminism underlies Madge Mearn's *The Sheltered Sea*; in W. Dane Buck's *An Average Woman*, a factory girl, married to the factory-owner's son, successfully meets the problems involved in a difficult situation; in *The Guiding Thread*, Beatrice Harraden led her fine heroine out of a Doll's House of a sort; in Stella Benson's *I Pose*, something of an extravaganza, the suffragette keeps well to the fore; and in Stacy Aumonier's *Olga Bardell* we meet a heroine of pronounced modernity engaging in repeated matrimonial experiments.

Differing in kind and quality, but of a romantic and adventurous stripe, are Rider Haggard's South African story *The Ivory Child*, E. Phillips Oppenheim's *An Amiable Charlatan* and *The Kingdom of the Blind*, and Lord Dunsany's fantastic *The Book of Wonder*.

**FOUR PROMINENT LITERARY FIGURES OF 1916**

Historical fiction was not forgotten in 1916. C. E. Robinson attempted a picture of Athenian life in the stories or sketches entitled *The Days of Alkibiades*; Maurice Hewlett wrote a vaguely historical Norse story, *Frey and His Wife*; Justin Huntly McCarthy aimed to revive the days of Queen Bess with *In the Spacious Times*; Baroness Orczy would transport the readers of her *Leatherstocking* to the period of Alva and the Prince of Orange; Marjorie Bowen offered sombre romantic tales of different lands in her stories of the seventeenth and eighteenth centuries published as *Shadows of Yesterday*; and Agnes and Edgerton Castle turned out a light romance, *Wind's Will*, that has to do more or less with Anglo-French relations in 1816. A number of the year's novels were concerned with the war. Among these are: Hugh Walpole's *The Dark Forest*, which stands high among the stories which the great conflict has produced; Patrick MacGill's *The Great Push* and *The Red Horizon*, where we read of the author's own experiences, cast into fictitious form, at the front with the London Irish Regiment; Mrs. Belloc Lowndes's ingeniously complicated *Good Old Anna*, concerned with the activities of German spies; John Palmer's *The King's Men*, which illustrates the all-pervasive influence of the war on English life; "Captain Charles de Creapigny's" *Where the Path Breaks*, the hero of which is a kind of military Enoch Arden; and the short stories of Guy Fleming's *Half Lights* and Sir Henry Newbolt's *Tales of the Great War*.

*American.* A curious interest attaches to Mark Twain's posthumously published novel, *The Mysterious Stranger*—the setting, Austria in the late sixteenth century—which strikes a pessimistic note, and reveals in our arch-humorist a sense of the futility of mortal things. From William Dean Howells, friend of Mark Twain, and dean of American letters, came *The Leatherstocking God*, based upon characters and incidents known to Mr. Howells's youth, and notable as a study of the psychology of a latter-day prophet, and as a picture of the life of a frontier Ohio settlement. From the same author came *A Daughter of the Storage*, a thoroughly characteristic miscellany, finished and delicate in its art, including verse and prose, sketch, dialogue, and story. In a very different vein is Hamlin Garland's *They of the High Trails*, faithful to the spirit and the letter of Western life, and to be contrasted with the dozens of theatrical "shilling shockers" that make free with similar material. James Lane Allen's *A Cathedral Singer* is a carefully wrought book, but it keeps sinking from sentiment to sentimentality as it idealizes maternal love and turns the Cathedral of St. John the Divine into a symbol. *Enoch Crane*, a novel left in a fragmentary state by the late Frank Hopkinson Smith, was completed by his son, F. Berkeley Smith, who made an earnest, if not very successful, endeavor to perform a delicate and difficult task. Mrs. Gertrude Atherton, in *Mrs. Balfame*, wasted talents, that might have been better spent, upon a murder and mystery story. Mrs. Margaret Deland departed as far from her accustomed field in *The Rising Tide* as did Mrs. Atherton in *Mrs. Balfame*. The former book presents a feminist heroine, and sets her off against the womanly woman, with her softer charms. A distinguished contribution to the literature of the

year was Mrs. Edith Wharton's *Xingu*, a collection of brilliant and finished short stories.

The books just named are from the pens of old favorites, highly valued, and justly so. Nor do these names complete the list of those who by earlier work have proved themselves worthy of special attention. To Mary S. Watts we have come to look for arresting interpretations of American life and character—an expectation which her latest novel, *The Rudder*, does not disappoint. Genuine interpretation in like fields characterizes the work of Dorothy Canfield, who is represented by the short stories in *The Real Motive*. Kathleen Norris, changing her usual scene for New York and a country colony adjacent thereto, would seem to be presenting through an interesting novel, *The Heart of Rachel*, a conviction that painless divorce is a social fallacy. Twice during 1916 Theodore Dreiser appeared. The sincerity and power of a naturalist, who, by his sympathetic insight and his art, has illuminated various phases of life and character, are evident, not only in his *Plays of the Natural and the Supernatural*, but also in *The Bulwark*, where we watch the strenuous efforts of Quaker parents to keep the younger generation from backsliding from the old doctrine and discipline. Booth Tarkington, in *Penrod and Sam*, gave his readers the pleasure of meeting again as genuine a youngster as has found his way into American literature of the last decade, and, in *Seventeen*, recounted with comic effect, and with truth to the tender sensibilities of adolescence, the puppy-love of a youth of seventeen summers. Meredith Nicholson, another Hoosier novelist, in *The Proof of the Pudding* reclaims a young wastrel in a story whose realistic integrity is diluted, as this writer's work is apt to be, by the tricky spirit of romance. A critical interpretation of American town life is wrought into Miss Alice Brown's *The Prisoner*, which is a kind of parable of prisoners of the conventions. Less fresh and authentic than the stories in which the late Jack London (q.v.) presented his sailors, miners, and titanic drinkers and bruisers is that author's *The Little Lady of the Big House*, where we are plunged into a world of motor cars, country houses, fine clothes, diamonds, and champagne. To Jack London's credit also the year has added a volume of short stories, *The Turtles of Tasman*. Penetrating portraiture, thoughtful analysis of social types, and good artistry mark Juliet Wilbur Tompkins's *The Seed of the Righteous*. Over against the rather rose-tinted picture of the plutocrat in Canon Hannay's *Gossamer* may be set the dark figure of the high financier in William Allen White's *God's Puppets*. There is good characterization and a good sea-story in Oswald Kendall's *The Martin Connor*. In Arthur Sherburne Hardy's *Helen* we meet an interesting group of people and are introduced to good cosmopolitan society. Anna Katharine Green, faithful practitioner of the detective story, produced in 1916 the tales assembled in *To the Minute*—in which she is by no means at her best. From Fannie Hurst came the short stories published as *Every Soul Hath Its Song*; from Eliza Calvert Hall the Kentucky stories *Clover and Blue Grass*; from Don Marquis the lightest and brightest satirical sketches that have appeared for many a day—the chronicles of the fair and indescribably cultured *Hermione*, and her "little group of seri-

ous thinkers." Rupert Hughes concerned himself to good purpose with the life of the hour in his *The Thirteenth Commandment*, where we meet a feminist heroine who combines a passion for fine clothes with a passion for economic independence; and in *Clipped Wings* wrote a novel concerned with the actor's calling. Mirth-provoking comedy and a good love story combine to commend Alice Duer Miller's *Come Out of the Kitchen*. In Nathan Kussy's *The Abyss*, the story of a Jewish lad in the underworld, there is marked power and sincerity. A Jewish boy, come from the Russian Pale to America, is the protagonist of Elias Tobenkin's *Witte Arrives*, a story good so far as its picture of Jewish-American life goes. Life in a New England village that hangs upon the skirts of a large city gives its material to Basil King's *The Side of the Angels*. Thoroughly American in style, theme, and character are Irvin Cobb's *Old Judge Priest*, and his short stories, grave and gay, entitled *Fiddle, D.D.!* and *Local Color*. Love, disillusionment, divorce, and love once more are all a part of Ellen Glasgow's *Life and Gabriella*. In *The Real Adventure* Henry Kitchell Webster posed the problem confronting a married couple who early discover that all they have in common is sex-instinct; and in *The Painted Scene* told faithfully realistic stories of theatrical life. Powerfully conceived and skillfully constructed is Sidney L. Nyburg's *The Conquest*, in whose hero love of power and love of a woman contend for the mastery. Ernest Seton Thompson offered a volume of stories—*Wild Animal Ways*; and beguiling stories of quite a different stripe are assembled in H. G. Dwight's *Stamboul Nights*. In Beatrice Forbes-Robertson Hale's *The Nest Builders* the home-making woman and the freedom-loving artist are at cross purposes.

Again in 1916, the historical novelists were busy with novels of the past, remote or near. T. Everett Harré attempted with dubious success, in his *Behold the Woman*, a tale of the fourth century, to write a novel of Christian edification. Faithful to the facts of history, if anachronistic in motivation and characterization, is Clarice M. Cresswell's romance of the Spanish Moors of the tenth century, *The Making and Breaking of Almansur*. Narrative interest, and a mass of romantic historical fact, borne buoyantly on the stream of the story, characterize Edward Lucas White's *El Supremo*, a tale that borrows its name from the title of Francia, the dictator of newly born Paraguay. Frank Sumner Townsend found a happy way to vitalize a page of history in his *Hugh Graham*, an historical novel of pre-Revolutionary days; Emerson Hough, in *The Magnificent Adventure*, told of Aaron Burr's conspiracy, and the Lewis and Clark expedition. John W. Appel's *The Light of Parnell* carries the reader from John Brown's raid through the Civil War; and Grace King's *The Pleasant Ways of St. Medard* deals with New Orleans in the Reconstruction period. With Zane Gray's *The Border Legion* one is set down in the Idaho of a half-century since, while Rex Beach's *Rainbow's End* plunges into the desperate doings in Cuba of the days of Weyler and Gomez.

Close appraisal of comparative values is here, as elsewhere in this article, difficult or impossible. Of the books now to be mentioned some should doubtless receive more, some less attention. In one group, romance and adventure

are the chief stock in trade: here stand Robert W. Chambers's *The Girl Philippa*; Frank H. Spearman's Wild-Western *Man of Music Mountain*; Harold Bell Wright's Southwestern story, *When a Man's a Man*; James B. Connolly's *Head Winds*, tales of adventure on sea and land; Rex Beach's stories, northern and tropical, *The Crimson Gardenia*; Richard Matthews Hallett's *Trial by Fire*, a novel of the Great Lakes; James Oliver Curwood's *The Haunted Woman*—the scene in the Northwest; and Stewart Edward White's *The Leopard Woman*—African in setting. All compact of Wall Street are the *Wall Street Stories* of Edwin Lefevre and the same author's *The Plunderers*, and Frederick Orin Bartlett's *The Wall Street Girl*. A sentimental prettifying of life is achieved in Eleanor Porter's *Just David* and *Six Star Ranch*, Anne Warwick's *The Unpretenders*, Harriet Comstock's *The Vindication*, and Rachel Sweet Macnamara's *Drifting Waters*. George Barr McCutcheon's popularity will not be diminished by *From the Housetops* and *The Light that Lies*, nor Mary Roberts Rinehart's by *Tish*, nor Harry Leon Wilson's by *Somewhere in Red Gap*, nor George Madden Martin's by *Emmy Lou's Road to Grace*, while Owen Johnson's *The Woman Gives*, a story of Bohemian New York, will hardly enhance either his popularity or his literary prestige. From Robert W. Chambers came, in addition to the book of his above named, the Adirondack and Florida stories entitled *The Better Man*; from Gouverneur Morris *We Three*; from Justus Miles Forman the posthumously published international novel *The Twin Sisters*; from Peter Clark Macfarlane the autobiographic *Held to Answer*; from Sherwood Anderson the Middle-Western novel *Windy Macpherson's Son*; from James Willard Schultz *Blackfeet Tales*, a noteworthy contribution to Indian lore; from Helen R. Martin the Pennsylvania-Dutch novel *Her Husband's Purse*; from Corra Harris *A Circuit Rider's Widow*, a novel telling of the life of a small Georgia town; from Grace Livingston Lutz *A Voice in the Wilderness*, which tells of the experiences of a young Eastern college girl who teaches a school in the wilds of Arizona; from Reginald Wright Kauffman *The Mark of the Beast*, in which an unsavory theme is poorly handled, and *The Silver Spoon* with a wealthy New Yorker for protagonist; from Sarah Clegghorn *The Spinster*, which considers in the form of fiction the place of the spinster in modern life; from Olive Higgins Prouty *The Fifth Wheel*, where we meet a heroine who turns from an empty fashionable life and brilliant match to the work-a-day world; from Mildred Aldrich nine stories, under the title *Told in a French Garden*; from Prof. Edwin Herbert Lewis a first novel, *Those About Trench*, incoherent in structure, but variously interesting.

POETRY. *English*. Maurice Hewlett in 1916 brought together, under the title *Gai Saber, Tales and Songs*, verses on varied themes, not forgetting themes connected with the war. John Masefield's *Good Friday and Other Poems* presents a phase of that poet's gift quite different from that which produced the realism of *The Widow in the Bye Street*: it contains a long dramatic poem in couplets, together with sonnets and a miscellany of short poems. In *Wolf's-Bane*, John Cowper Powys presented a group of his verses remarkable, among other qualities, for their command of old-fashioned me-

ters, and for the diversity of their moods and themes. The war poems and other lyrics, and the plays, with their fine blank verse, of Wilfrid Wilson Gibson's *Battle and Other Poems* were a notable contribution to the year's poetry. So also were the poems of Gordon Bottomley—*Laodice and Danæ*—with their splendidly picturesque quality, and their note of the morbid and exotic. In *The Listeners* of Walter de la Mare appeared a volume of good promise. Notable, also, in the poetry of the year were: Francis Ledwidge's *Songs of the Fields*—the author a poet in the Royal Enniskillen Fusileers; James Stephens's *Green Branches*, which laments the tragic ending of the three young Irish poets who were leaders in the recent Irish rebellion; William Butler Yeats's *Responsibilities and Other Poems*; and Padraic Colum's *Wild Earth, and Other Poems*.

An important poetic anthology of the year, though not of the year's verse, was that edited by Robert Bridges, and entitled *The Spirit of Man*. A second anthology, *Georgian Poetry*, a judicious collection of contemporary verse, evinces a quickened inspiration in the British Muse, and offers much to reward a reader.

*American*. Edward Arlington Robinson, second to none among living American poets, sustained his reputation with *The Man Against the Sky*, verses that hold to the classic forms, and are essentially original enough to dispense easily with the novelties of free verse or shackled prose. Percy Mackaye was represented by selections from his work in the two-volume *Poems and Plays* and by the Shakespeare masque, *Caliban by the Yellow Sands*. Dramatic force and strong human interest, as well as more purely poetic qualities, distinguish Hermann Hagedorn's *The Great Maze and The Heart of Youth*. In *Songs and Satires*, Edgar Lee Masters is more varied in theme and manner than he was in his *Spoon River Anthology*. Paul Shivel, a farmer-poet, raises the simple realities of rural life to the poetic level in *Stillwater Pastorals*. Cale Young Rice's *Earth and New Earth* contains poems both lyric and dramatic. A distinctive imaginative quality and his own original way of expressing himself poetically mark the verses of Benjamin de Caseres, published as *The Shadow-Eater*. Carl Sandburg showed himself a vers librist of power in *Chicago Poems*, which pity the poor and lash selfish and plutocratic wasters. Notable also among the poems of the year were: Walter Conrad Arensberg's *Idols*, Louis Untermeyer's "*—and Other Poems*"; Charles O'Donnell's promising *The Dead Musician*; the pleasant rhymes of Charles Hanson Towne's *To-day and To-morrow*; the late Madison Cawein's *The Cup of Comus*; Benjamin R. C. Low's *The House That Was and Other Poems*; William Alexander Percy's *Sappho in Levkas and Other Poems*; Newbold Noyes's tuneful *Echo*; Geoffrey C. Faber's *Interflow*; the uneven but often fine work in George Sterling's *Beyond the Breakers*; Dana Burnet's *Poems*; Arthur Stringer's *Open Water*; Vachel Lindsay's *General William Booth Enters Heaven and Other Poems*; the *Poems* of Alan Seeger, a young American who served in the French Foreign Legion and was killed in a recent Allied drive; Clinton Scollard's *Italy in Arms and Other Poems*; Louis V. Ledoux's *The Story of Eleusis*, remarkable for its evenly fine poetical texture and its ex-

pression of fresh emotion through classic myth and imagery; and Miss Amy Lowell's *Men, Women, and Ghosts*, in free verse.

The ladies did their part in the poetry of 1916. Miss Edith Thomas arraigned war in her *The White Messenger and Other War Poems*, and with that volume and her *The Flower from the Ashes* sustained the enviable reputation she has won. Musical quality, happy phrasing, and, occasionally, vigor and distinction, characterize Mabel Parker Hudson's *Script of the Sun*. In Ruth Comfort Mitchell's (Mrs. Young's) *The Night Court and Other Poems*, there are sincerity and power; and in the posthumously published *Verse* of Adelaide Crapsey genuine inspiration and a finished art. Ruth McEnery Stuart was represented by a volume of dialect verse—*Plantation Songs and Other Verse*. In 1916—more than a decade after the author's death—appeared Alice Freeman Palmer's *A Marriage Cycle*, remarkable for its depth and glow of feeling, and for its fine, though far from flawless, art. There is poetic beauty as well as glowing sympathy for the poor and the unfortunate in Margaret Widdemer's *Factories and Other Lyrics*. An arresting quality draws one to the poems—*Songs to Save a Soul*—of Irene Rutherford McLeod, a young poetess, for whose future this volume promises well.

During the year the anthologists were at work. Alfred Noyes edited, under the title *A Book of Princeton Verse, 1916*, a collection of poems by Princeton undergraduates; Alfred Kreymborg made an anthology of the newer free verse "formless forms" of American poets, entitled *Others*; the indefatigable William Stanley Braithwaite aimed to cull the choicest poetic blossoms from the periodicals of the year in his *Anthology of Magazine Verse for 1916 and Year Book of American Poetry*; Charles G. Blanden and Minna Mathison edited the *Chicago Anthology*; Mrs. Waldo Richards assembled the collection *High Tide*; and J. W. Cunliffe published *Poems of the Great War*.

REFERENCE WORKS. The year saw the completion of a second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA, in 24 volumes, publication of which was begun in 1913. *The Cambridge History of English Literature* was further extended by the appearance of vol. xii, dealing with "The Nineteenth Century."

ESSAYS, LITERARY CRITICISM, AND LITERARY BIOGRAPHY. *English*. The tercentenary of Shakespeare's death was honored by a variety of appropriate publications. A new edition of Sir Sidney Lee's *Life of Shakespeare*, incorporating the latest results of scholarship, appeared. This book, all critical deductions made, still holds its place as the standard biography. From Sir Sidney came also a clear survey of the influence of the renaissance in Italy on the English bard—*Shakespeare and the Italian Renaissance*. An imposing volume of miscellaneous studies, entitled *A Book of Homage to Shakespeare*, and edited by Israel Gollancz, was a distinguished book in its field. Mrs. C. C. Stopes, in *Shakespeare's Industry*, made a series of studies designed to show what antecedent long labor must have conditioned the writing of the plays and poems. Those whose convictions impel them to attempt an uprooting of faith in the Shakespearean authorship of the plays were of course not slumbering through the tercentenary, as G. G. Green-

wood's *Is There a Shakespeare Problem?*, which would rob Shakespeare to the advantage, not of Bacon, but of some unidentified poet, and as James Phineas Baxter's Baconian *The Greatest of Literary Problems* bear witness.

In 1916 George Earle Buckle continued W. P. Monypenny's interminable *Life of Disraeli* by the addition of a fourth volume covering the years 1855-1868. In the *Correspondence of Gray, Walpole, West, and Ashton (1734-1770)* 100 unpublished letters were collected. Edmund Gosse's enlightening and urbane essays, *Inter Arma*, were concerned with French topics bearing upon the war. In entitling his volume of essays *The War for the World* Israel Zangwill intended to indicate as his central theme the war of reason and justice against force and greed. It was on the war, largely, that John Galsworthy reflected in the papers published as *The Sheaf*, and the same concern occupied G. K. Chesterton in his *The Crimes of England*, and H. G. Wells in *What Is Coming: A European Forecast*. The interest attaching to the book of a man who has been a part of the history of his time belongs in full measure to Earl Curzon's *Subjects of the Day*. An illuminating study of Blake as a mystic, *Vision and Vesture*, came from the hand of Charles Gardner. And from the hand of John F. Harris came *Samuel Butler*, a critical biography of the author of *Erewhon*. Edward Lewis wrote a sympathetic study of a many-sided and interesting man in his *Edward Carpenter*. Other critical biographies were: R. Thurston Hopkins's workmanlike and comprehensive *Rudyard Kipling*; Harold Child's *Thomas Hardy*; Julius West's lively *G. K. Chesterton*; Hugh Walpole's valuable *Joseph Conrad*; Ford Maddox Hueffer's *Henry James*, which can hardly hope, be it said by the way, to be accepted as a standard study of its subject, and Rebecca West's *Henry James*. Interesting for what it tells of the "poet of democracy" and his friends and thought-provoking at many points are Edward Carpenter's reminiscences in his *My Days and Dreams*. In *English Poets and the National Ideal*, Prof. E. De Sélin-court studied the great expressions of the national spirit from Shakespeare on; in *Old Familiar Faces* Theodore Watts-Dunton reminisced richly and delightfully; in *The Peace of the Augustans* Prof. George Saintsbury made a study of eighteenth-century literature, which is not up to the best standard of the work of that *doctor universalis*; in *The Poets Laureate of England* W. Forbes Gray was adequate, critically and biographically. Wide learning, stimulating freedom of thought, and gusto in the writing are qualities of Joseph McCabe's discussion of several present-day leading questions in his *The Tyranny of Shams*. Interesting for the light it threw upon the moods and ideas of its author was W. B. Yeats's *Reveries Over Childhood and Youth*. Remarkable for their rare literary quality, the fertility of their thought, and in other ways, were the essays of "Æ"—George W. Russell—entitled *Imaginations and Reveries*. Subtle studies of a strangely ill-sorted company were assembled in Arthur Symons's *Figures of Several Centuries*. E. V. Lucas published a volume of essays, in which he was graver than his wont, appropriately entitled *Cloud and Silver*.

American. American, as well as English, scholarship fitly observed the Shakespeare tercentenary, and the *Shakespearian Studies*, con-

taining 18 essays, by members of the Department of English and Comparative Literature of Columbia University, was probably not surpassed by any critical publication called forth by the occasion. There is fine scholarship, too, in the *Shakespeare Studies*—13 of them there are—made by members of the English Department of the University of Wisconsin. Prof. George Lyman Kittredge's address on Shakespeare, published by the Harvard University Press, was an admirable performance, as was, also, in a very different way, Prof. Ashley H. Thorndike's comprehensive survey of the Elizabethan theatre in his *Shakespeare's Theatre*.

Prof. J. B. Fletcher of Columbia, in his *Dante* (Home University Library) wrote a volume sure to rank with the best interpretative criticism in English of the great poet—a book, however, for the initiated. The neophyte in Dante study will find *Dante: How to Know Him*, by Prof. Alfred M. Brooks, a helpful volume containing translations, summaries, and notes preceded by an introduction. A genial and pleasant study of *Wordsworth*, though no way remarkable, was written by Prof. C. T. Winchester for the *How to Know Him* series. To the same series Prof. W. P. Trent of Columbia contributed an informational volume on Daniel Defoe. Some new light is thrown on the closing years of Poe by *Poe's Helen*, the life of Mrs. Sarah Helen Whitman, who was engaged to Poe—a book from the pen of Caroline Ticknor. A startling feature of Prof. C. Alphonso Smith's biography of "O. Henry" (Sydney Porter) was its revelation of the fact that the popular short-story teller served a term in the Ohio State Penitentiary—and unjustly, Professor Smith contends. A careful and life-like little sketch was drawn by Clara E. Laughlin in her *Reminiscences of James Whitcomb Riley* (q.v.), the Hoosier poet whose death is to be recorded with sorrow. Bright sidelights were thrown upon a number of men who were doing a noteworthy part of the world's work in art and letters in the last quarter of the nineteenth century in Mrs. Elizabeth Pennell's *Nights*. Rich in varied interest was William Winter's *Vagrant Memories*, a companion volume to his earlier *Other Days*, and the same is true of *The Letters of Richard Watson Gilder*, edited by Miss Rosemund Gilder—a record of the influential part Mr. Gilder played in American letters, art, and civil life. Sure of a place of honor in its field is W. D. Howells's *Years of My Youth*, an autobiography devoted to the author's boyhood and young manhood in Ohio. An interesting epistolary collection was *The Letters of Henry Brevoort to Washington Irving*, edited by George Hellman.

The history of recent tendencies in fiction was written by Prof. William Lyon Phelps in his *The Advance of the English Novel*. A new theory of the sentimental drama of the eighteenth century was advanced in Dr. Ernest Bernbaum's stimulating analytical study, *The Drama of Sensibility*. The dramatic critic of the New York *Evening Post*, Mr. John Ranken Towse, wrote a valuable volume of theatrical criticism and reminiscence—*Sixty Years of the Theatre*.

John Burroughs's contribution of the year was a volume of studies of nature and philosophical reflections, *Under the Apple Trees*. Nimbly written, humorous, and in familiar vein are the essays by Prof. Dallas Lore Sharp entitled *The*

*Hills of Hingham.* From Woodrow Wilson came this year a substantial volume of essays, well worthy of attention—*On Being Human*; and from Elihu Root came a notable book, *Addresses on International Subjects.*

**HISTORY, GENERAL BIOGRAPHY, AND MEMOIRS.**  
*English.* Prof. T. F. Tout centred his attention upon a turning point in the constitutional and administrative history of the realm in *The Place of the Reign of Edward II in English History.* In writing his *History of France* (3 vols.), J. R. Moreton Macdonald met a need, and made a book of distinctive merit. It is a valuable synthetic collection of documentary material relating to the years between 1756 and 1858 that Prof. J. Ramsay Muir offered in *The Making of British India.* A Boer revolt and its suppression under Botha is a chapter of contemporary history set forth by P. J. Sampson under the title *The Capture of De Wet*, and William Charles Scully's *A History of South Africa* is a good account of development in South Africa. That vigorous and versatile writer, Joseph McCabe, in his *Crises in the History of the Papacy*, followed the careers of representative popes, and filled in the gaps with summaries of intervening periods. A tragic page of contemporary history was written by John Masefield in his *Gallipoli*, which is also a moving *apologia* for a colossal failure. In a monograph devoted to clearing up certain important points in Roman and ancient German history, William A. Oldfather and Howard Vernon Cantor collaborated.

Malcolm William Wallace's *Life of Sir Philip Sidney*, a book of 1916, will probably take its place by Fox-Bourne's *Memoir* as an authority on Sidney's life and character. With Sir Edward Cook's *Delane, of the Times* the *Makers of the Nineteenth Century Series* opened auspiciously. Lord Charnwood's *Lincoln* was a notable biography. Alfred Russel Wallace, scientist and close friend of Darwin, was the subject of a *Life* by James Marchant. Quite ample justice was done to the character and career of R. H. Benson in *The Life of Monsignor R. H. Benson*, by C. C. Martindale, S. J. Connected by blood and friendship with aristocratic and politically important families, Shane Leslie, invalided from his regiment, was in a position to write, and did write, a sketchy, anecdotal, and interesting book under the title *The End of a Chapter.* Diplomat, sportsman, author, and other things besides, Lord Redeadale tells of his acquaintance with many of the men and women who made history, literature, and art in Europe for half a century, in his two-volume *Memories.* A good biography, sweeping between its covers much South African history, was Harold Spender's *General Botha.* A deal of more and less significant personalia was brought together in *The Journals of Lady Knightley of Fawsley*, edited by Julia Cartright. Completing in this third volume entitled *The Widowhood of Queen Victoria* his study of the Queen's life and character, Clare Jerrold, faithful biographer, leaves his reader well aware that, if Victoria is to be idealized, the process must be left to purblind patriotism, and not entrusted to a clear-eyed and conscientious chronicler and analyst. *The Life and Letters of Sir John Henniker Heaton, Bart.*, was published by his daughter, Mrs. Adrian Porter. The career of a witty and dashing gentleman and gallant lover was entertainingly presented in *The Chevalier de Boufflers*, by Neta

H. Webster. In *A Noble Woman*, Ernest Protheroe wrote the story of Edith Cavell's life and tragic death. He also wrote a book on Lord Kitchener. To the endless making of books on Napoleon was contributed in 1916 *Letters of Captain Englebert Lutyens*, which Sir Lee Knowles edited, and which tells of the last days of the Emperor. British men in various walks of life are discussed by George W. E. Russell in his *Portraits of the Seventies.* *Jeffrey Amherst*, by Lawrence Shaw Mayo, is a biography of the English Baron who is associated with the conquest of the French in Canada.

*American.* A valuable contribution, alike to local and continental history, was made by Dr. Charles Edward Chapman in *The Founding of Spanish California.* *The Mastering of Mexico*, by Kate Stephens, is a condensed version of the account one of the chief soldiers of Cortez, Bernal Díaz del Castillo, gave of his part in the conquest of Mexico. An important book, composed largely of letters written between 1542 and 1706, entitled *Spanish Explorations in the Southwest*, and well edited by Edward Eugene Bolton, was this year added to the *Original Narratives of American History* series. Prof. Robert Granville Caldwell embodied no little valuable material of his own unearthing in his *The Lopez Expeditions to Cuba, 1848-1851.* A study of Reconstruction in Arkansas was made by Gov. Powell Clayton in *The Aftermath of the Civil War in Arkansas*, and a kindred study, *Reconstruction in Georgia*, by Dr. C. Mildred Thompson. In Dr. John W. Burgess's good study, *The Administration of President Hayes*, the eulogistic note is everywhere struck. H. C. Wright's *History of the Third French Republic* carries French history from 1870 to 1914 in a brief and compact chronicle. From Francis Hackett came *Ireland: A Critical Examination.* Strong on the documentary side, if not very strong on the interpretative side, was Dr. Raymond du Bois Cahill's *The Sovereign Council of New France*, a Columbia doctoral thesis. *England and Germany, 1740-1914*, by Prof. Bernadotte Everly Schmitt, is an important study in international history involving an analysis of conditions that led up to the great war. A noteworthy book in its field was Prof. Knut Gjerset's *History of the Norwegian People* (2 vols.). Free from any bias of the hour is Prof. R. H. Fife's *The German Empire Between Two Wars.* The year added to the *Harvard Historical Studies* Robert Howard Lord's *The Second Partition of Poland.* From first-hand study and observation came John Foster Fraser's *Russia of To-day.* *Columbia University Studies in History* were increased by the appearance of Dr. Paul H. Clements's *The Bower Rebellion*, while from the pen of Jefferson Jones came *The Fall of Tsingtau*, and from Gardner L. Harding *Present-Day China.* Herbert Adams Gibbons has to his credit *The Foundation of the Ottoman Empire*, which together with William Warfield's *The Gate of Asia*, provides informative material on the peoples and political conditions of the past in regions now the Eastern theatre of the great war. In *Our Military History* Maj.-Gen. Leonard Wood pleaded vigorously for American adaptation of Swiss or Australian systems of compulsory military service. Into *American Diplomacy* Charles Russell Smith skillfully condensed a century and a quarter of diplomatic history and, in *America's Foreign Relations*,

Prof. Willis Fletcher Johnson made a substantial contribution to this subject. Of the varied relations between Jew, Greek, and Roman, an admirable, scholarly account was given in Dr. Max Radin's *The Jews Among the Greeks and Romans*.

Interesting biographies and memoirs abounded in 1916. More remarkable for comprehensiveness than for literary quality was Allen C. Clark's *The Life and Letters of Dolly Madison*. With charming simplicity, Maud Howe Elliott, assisted by Florence Howe Hall, told the whole story of their mother's life in *Julia Ward Howe, 1819-1910*. A good study of Lincoln as lawyer was made by John T. Richards in *Abraham Lincoln, the Lawyer-Statesman*. Charles S. Olcott wrote a popular biography, the *Life of William McKinley* (2 vols.); Charles G. Washburn, a study of Colonel Roosevelt's character and career in *Theodore Roosevelt*; Prof. Eugene Brooks the eulogistic *Woodrow Wilson as President*; George Creel—with unstinted admiration—his *Wilson and the Issues*; Prof. Henry J. Ford a study of the man and his career—*Woodrow Wilson: The Man and His Work*; and Judge William M. Ransom a campaign document, *Charles E. Hughes, the Statesman as Shown in the Opinions of the Jurist*. In *Booker T. Washington: Builder of a Civilization*, Lyman Beecher Stowe and Emmett J. Scott collaborated. A good life of the distinguished Governor of Massachusetts was written by Lawrence B. Evans in his *Samuel W. McCall*, and Gamaliel Bradford published penetrating studies of men of the Civil War Period in his *Union Portraits*. The filibuster William Walker is the protagonist of Prof. William O. Scroggs's absorbing *Filibusters and Financiers*. Interesting biographically and socially was the *Life, Diary, and Letters of Oscar Lovell Shafter*—the subject of the book an Associate Justice of the Supreme Court of California. Sketches of important actors in contemporary Mexican life and records of recent notable diplomatic episodes constitute the more arresting pages of Mrs. Edith O'Shaughnessy's *A Diplomat's Wife in Mexico*. Frank and sprightly is the brief autobiographic sketch, *Geraldine Farrar: the Story of an American Singer*. Under the title *A Master Builder*, Bishop Charles H. Brent wrote the life of Bishop Satterlee. *Francis Asbury*, by Dr. Ezra Squier Tipple, is a biography of the real organizer and founder of the Methodist Episcopal Church in America. Stephen Chalmers wrote an appreciation of Edward Livingston Trudeau (see also below) entitled *The Beloved Physician*. Among reminiscences and journals should be mentioned: *The Journals of Captain Meriwether Lewis and Sergeant John Ordway, Kept on the Expedition of Western Exploration, 1803-1806*, containing material which escaped Dr. Thwaites; the valuable *Diary of James Galatin: Secretary to Albert Gallatin: 1813-1827*; *Reminiscences of Frederick W. Seward*; Richard Whiteing's *My Harvest*, containing delightful recollections of London, of Paris, of Spain in revolution, of Russia; Everett P. Wheeler's *Sixty Years of American Life*; and the *Autobiography of Dr. E. L. Trudeau*, founder of Saranac sanitarium, and pioneer in the open-air treatment of tuberculosis—an extraordinary life history.

RELIGION. *English*. The proper relation of Church and State was the theme of Dr. Peter

Taylor Forsyth's *Theology in Church and State*. Sprung, no doubt, from that fertile seed of trouble, the Kikuyu incident, appeared Canon A. J. Mason's *The Church of England and Episcopacy*, which occupies itself with the nature of the Episcopacy, the validity of ordination, the sacraments, etc., and aims, surely, at the Kikuyu fraternizing that so offended Anglican regularity. J. Estlin Carpenter contributed to *American Lectures on the History of Religion* his *Phases of Early Christianity*. Lectures by nine eminent Churchmen, written from the Anglican angle, were assembled in *Our Place in Christendom*. Canon Driver's fine, illuminating scholarship was displayed in his *The Ideals of the Prophets*. The heart-searching induced by the war was at work in Rev. William Temple's *Church and Nation*, in Dean H. Henson's *War-Time Sermons*, in Charles E. Osborne's *Religion in Europe and the World Crisis*, in Prof. Percy Gardner's *The Faith and the War*. The adaptability of the ethical ideal of Christ to present-day problems was Hastings Rashdall's theme in *Conscience and Christ*. The ideal of Christian romanticism as St. Francis understood it is what Father Cuthbert set himself to expound in his *The Romanticism of St. Francis*. A sound account of Hindu metaphysical and religious thought was offered by R. W. Frazer in *Indian Thought Past and Present*, and a collection of interpretative studies in Hindu life and religion in *Religion and Dharma*, by Margaret E. Noble (Sister Nivedita). Henry Louis Jordan wrote a book—*Comparative Religion: Its Adjuncts and Allies*—on a subject which he has made his special province. With the two volumes of his history of Modern English Catholicism published this year—their title *The Sequel to Catholic Emancipation*—Monsignor Bernard Ward brought his chronicle down to the reestablishment of the hierarchy in 1850. The well-known historian of religious philosophy, Clement C. J. Webb, collected lectures he delivered at Oxford in *Studies in the History of Natural Religion*, treating his subject with the sure familiarity of a master.

*American*. A book dealing with social questions from the religious point of view—*Faith and Social Service*—came from the pen of Dean Hodges. Prof. I. J. Peritz wrote an admirable survey of Hebrew history entitled *Old Testament History*; Prof. F. L. Strickland attempted to harmonize science and Christian convictions in *Foundations of Christian Belief*; Bishop Frederick De Land Leete, from the view-point of one who regards the churches as the proper leaders in civic purification, presented his *The Church in the City*; and Dr. William DeWitt Hyde gathered into a book—*The Gospel of Good Will as Revealed in Contemporary Scriptures*—his Yale lectures. Adhering closely to current orthodoxy, Bishop E. H. Hughes wrote *The Bible and Life*, W. Davison *The Chief Cornerstone*, C. W. Laufer *The Incomparable Christ*. Broader in view were Joseph M. M. Gray's *The Old Faith in the New Day*; Mrs. Katrina Trask's *The Mighty and the Lowly*; H. S. Coffin's *Some Christian Convictions*; W. Elsworth Lawson's *The Master Light*; Frank H. Decker's *Christ's Experience of God*; Dr. Galusha Anderson's *Science and Prayer*, and Cyril Hopher's *The Fruits of Silence*. *The Religion of Experience* was by Horace J. Bridges of the Chicago Ethical Society. Dr. Joseph K. Greene's *The Levant* made

the benefit of Christian missions to the Turks its theme. A book of importance in its field was James Pratt's *India and Its Faiths*, a critical study of modern faiths in India. Julian K. Smyth championed the faith that is in him, as official head of the New Church (Swedenborgian), in *Certainties of Belief*. S. M. Zwemer's *Mohammed or Christ* is a book of special pleading, while *Mohammedanism* is a scholarly treatise on the relation of the faith of Islam to Christianity written by C. Snouck Hurgronje, a Dutch scholar, and published in the United States. A sane interpretation of mysticism to the average man was Prof. John Wright Bucham's *Mysticism and Modern Life*. A brief account of a cult killed by Christianity came from J. Pythian-Adams, its title *Mithraism*. Dr. Francis J. Hall, in *Creation and Man*, contends that science has not affected the Catholic doctrines concerning his theme.

TRAVEL AND DESCRIPTION, *English*. Prof. J. Y. Simpson, as a result of his travels and of his reflections upon probable *post-bellum* effects, wrote *Russia's Self-Discovery*; Stephen Graham in *Through Russian Central Asia* foresees Russian regeneration following upon the war, and great strides toward liberalism, and has much of interest to record upon a miscellany of subjects; and William Barnes Stevni blended history, description, and anecdote in *Petrograd, Past and Present*. In prose appeared *Our Summer in the Vale of Kashmir*, by F. Ward Denys, a description of the scenes which Moore presented poetically in romantic colors in *Lalla Rookh*. Marvellously vivid in description of the Great Bushmanland Desert of South Africa, its flora, fauna, and natives, is W. C. Scully's *Lodges in the Wilderness*; descriptively effective also, is *A City of the Dawn*, by the Rev. Robert Keable, an Anglican missionary, evidently at home amid east African scenes. Griffith Taylor, in his *With Scott: the Silver Lining*, told of Captain Scott, of the brave company he led, and of the scientific results of the Antarctic expedition. Primarily, though far from exclusively, of anthropological interest was Capt. Thomas Whiffen's *The North-West Amazons*. In *On Alpine Heights and British Crags*, George D. Abraham appeared as a scaler of numerous perilous mountain slopes.

*American*. Fresh, graphic, and substantial, especially, perhaps, where it is concerned with the Arizona journeys, South America, and the Indians, is Colonel Roosevelt's *A Book-Lover's Holidays in the Open*. Vivacity, humor, and a zest for rough travel made Mary Roberts Rinehart's *Through Glacier Park* a very readable book. The descriptions of splendors and beauties in Ruth Kedzie Wood's *The Tourist's Northwest* made this volume a potent lure to those free to roam the regions of which it tells. George Wharton James took a panoramic sweep over the West and Southwest in *Our American Wonderlands*. Millionaire residences are represented with appropriate sumptuousness in Porter Garnett's *Stately Homes of California*. A young Easterner turned ardent Westerner, George Palmer Putnam, wrote buoyantly of a section of the West now in the making in *In the Oregon Country*. Lively, picturesque, and full of studies of animal life was Harry A. Auer's *Camp Fires in the Yukon*. An admirable book, fruit of years of patient research, was L. Bradford Price's *Spanish Mission Churches of*

*New Mexico*. Following his peripatetic method, Harry A. Franck filled his *Tramping Through Mexico, Guatemala, and Honduras* with impressions and substantial information. Remarkable for its illustrations alone was Mrs. Wesley Butler's *Historic Churches in Mexico*. The Rev. J. A. Zahm of the Roosevelt Expedition had much of interest to say of the past of, and of present conditions in, Brazil, Argentina, Chile, Paraguay, and Uruguay, in his *Through South America's Southland* and, in saying it, concluded a series of three volumes. Social, political, and economic relations with South and Central America and with the West Indies are considered in Chester Lloyd Jones's *The Caribbean Interests of the United States*. An admirable traveling companion to the Lesser Antilles is A. Hyatt Verrill's *Isles of Spice and Palm*. Useful as an informing miscellany of information and as an historical summary is *Cuba Old and New*, by the newspaper correspondent, Albert G. Robinson. A book largely of scientific content, recording a trip along the coast of Western Cuba, was written by John B. Henderson, and published as *The Cruise of the Tomas Barrera*. Mrs. Katharine Fullerton Gerould recorded her observations and experiences in *Hawaiian Scenes and Impressions*. A notable chronicle of Arctic exploration was *The Last Voyage of the Karluk*, related by the *Karluk's* captain, Robert A. Bartlett, and written from this narrative by Ralph T. Hale. Now and again there is valuable matter in Maud D. Haviland's *A Summer in the Yenesei*, which chronicles a sojourn in a village of Siberian exiles. The result of his 12 years' residence in Peking was harvested by the Methodist Episcopal bishop, Dr. James W. Bashford, in *China—an Interpretation*. An open-eyed traveler's book, with special war-time appeal, was Arthur Ruhl's *Antwerp to Gallipoli*. Elizabeth Shepley Sergeant's *French Perspectives* opened interesting vistas upon French life.

FEMINISM. The year did not lack its quota of books dealing with feministic problems. A number of these have been noted above. The following may be mentioned here: Mrs. Walter M. Gallichan's ("C. Gasquoine Hartley's") *Motherhood*, a work which ranges wide in its studies of woman as a factor in social life; W. L. George's competent and suggestive *The Intelligence of Woman*, which champions, with sound sense, a rather advanced feminism. Paul Jordan Smith's *The Soul of Woman*, giving from an advanced point of view an account of feminist ideals as they have taken form in recent years; Florence E. Smith's *Mary Astell*, a substantial contribution to the history of woman's rights; *Anti-Suffrage Essays*, by Massachusetts women who had a hand in the victorious Bay State campaign of 1915; *Feminism*, by Mr. and Mrs. John Martin; *Problems of Women Solved*, by Anna Pratt Simpson, which tells of the work of the Woman's Board of the Panama-Pacific Exposition; an account of the International Conference of Women Workers at the Panama-Pacific Exposition, by Mrs. Mary Wright Sewall—*Women, World War, and Permanent Peace*; and Jane Adams's *The Long Road of Woman's Memory*.

**LI YUAN-HUNG.** A Chinese statesman, who became President of the Republic of China on the death of Yuan Shih-kai (q.v.), June 6, 1916. He was born in 1864. His early experience was gained in the navy, on a cruiser during the Chino-Japanese War, in the army, and as a student of fortifications in Japan. He had become so identified with the radical political group that when the revolution broke out at Wuchang in 1911 he was forced to take command of the revolutionary army. He helped to arrange for the Shanghai Peace Conference and after the abdication of the Manchus served under Sun Yat-sen as Vice-President of the republic, and in 1913 was reelected, Yuan Shih-kai then becoming President. Li also served as chief of the general staff of the army. When the President declared his intention of having himself made Emperor, Li resigned and identified himself with the Southern faction working to retain the republic. He returned to the support of Yuan when the latter gave up all idea of a coronation. It was expected that his succession to the presidency would satisfy the radicals. Indeed, in the preceding month, May, four of the provinces had already elected him to the office.

**LLOYD GEORGE, DAVID.** A British statesman, appointed prime minister Dec. 6, 1916. He was born in Manchester on Jan. 17, 1863, of Welsh parentage. His father, a schoolmaster, died at Liverpool in early manhood, and his son was left to the care of an uncle at Criscieth in Wales, where he was educated at the Llanystymdwy Church school and privately. He studied for the law, became a solicitor in 1884, and won a high reputation in Wales by his successful conduct of a lawsuit which involved the right of burial of non-conformists in the burying grounds of the Established Church. The decision upholding that right was confirmed by the Court of Appeal. In 1890 he was elected as a Liberal for Carnarvon Boroughs; but his first ten years in the House of Commons were not remarkable. It was not until the Boer War, to which he was fearlessly opposed, that the real strength and resourcefulness of his character became known. By his speeches against the war he became intensely unpopular, on one occasion barely escaping with his life from the fury of a Birmingham mob. After the close of the war his reputation rose rapidly, and in 1905 he was appointed president of the Board of Trade in the Campbell-Bannerman ministry. When Mr. Asquith became Premier in 1908 David Lloyd George was made Chancellor of the Exchequer, which position he held until late in 1915. During his term of office he was the protagonist of three measures whose discussion and enactment into law plunged Britain into a fever of excitement unknown since the days of the Reform bill of 1832. The first was a bill in 1908 for old-age pensions; the second was a radical budget in 1909, which not only increased the indirect taxes on tobacco and spirits, but added heavily to the direct income tax and introduced a revolutionary feature in the appropriation for the benefit of the state of 20 per cent of all increase in land valuation, with just exceptions for improvements. In 1911 he secured the passage of the National Insurance bill, a measure for the relief of the working classes against accident, sickness, old age, etc. During his activity in behalf of these measures he developed a resourcefulness, debating

power, and eloquence which proved equal to every emergency. The wrath of the aristocracy was turned upon him for his attack upon the unearned land increment, but in addition to his argumentative reply he reminded them that "aristocracy is like cheese; the older it is the higher it becomes." He was never at a loss for the scorching word or phrase, nor for the most telling appeal to popular sympathies. To these gifts were added the more important qualities of quick decision and of rapid accomplishment in great emergencies. He assisted Asquith in prosecuting the Parliament bill, which aimed under certain conditions to take away the veto power of the House of Lords, to a successful conclusion. In 1913 he was criticized for his part in the indiscreet purchase of shares in the American Marconi Wireless Company; but nothing dishonorable was proved against him. The same year he began a nation-wide campaign to restore the land to the people by breaking up the large estates; but the opening of the European war in August, 1914, put aside all domestic affairs. As Chancellor of the Exchequer he obtained an unprecedented budget and war loans; and in the Asquith coalition cabinet, formed May, 1915, he resigned his post to become Minister of Munitions. See *GREAT BRITAIN, History*; *WAR OF THE NATIONS*; also articles on *GREAT BRITAIN* in previous *YEAR BOOKS*.

**LOAN AND TRUST COMPANIES.** No section of American banking has expanded more rapidly than have the loan and trust companies. In 1916 some of the larger of these companies entered upon a new era in their history through the extension of their financial and commercial services and interests in foreign countries. Departments were established for handling foreign acceptances, particularly of bills connected with Central and South American trade. These companies, like other banks, also participated in foreign loans. On June 30, 1916, there were reported 1932 loan and trust companies, with total resources of \$7,654,000,000. This was an increase of 155 in their number and of \$1,326,000,000 in their resources during the year. Their loans and discounts on June 30th aggregated \$4,065,000,000, and their cash, \$1,477,000,000. Their capital aggregated \$530,000,000; surplus, \$637,000,000; and deposits, \$6,247,000,000. This last item was an increase of \$1,237,000,000 over one year earlier. The resources of the trust companies in those States showing the largest number of such banks were as follows: New York, \$2,620,079,040; Pennsylvania, \$1,075,745,007; Illinois, \$761,438,852; Massachusetts, \$521,611,568; Ohio, \$452,912,854; New Jersey, \$340,923,357; California, \$286,489,438; Missouri, \$172,379,852; Rhode Island, \$155,520,641; Maryland, \$107,158,833; and Connecticut, \$102,745,325.

**LOAN SHARKS.** An interesting aspect of the general movement for social betterment has been the effort to remedy the abuses attending the business of making small personal loans. Such loans are sometimes accompanied by collateral of various sorts, but are more frequently based on a pledge of salary or wages. Rates of interest have been exorbitant and collection of interest and loans has frequently been carried out in ruthless disregard of the welfare of borrowers. Consequently during the past few years extensive legislation has been secured which as

a rule has limited rates of interest on such loans to 3 per cent per month; all fees whatsoever have been eliminated; loan agencies have been required to secure licenses and to be bonded under State supervision; in addition the new laws require the lender to give the borrower a complete statement of all conditions attending the loan, and fix adequate penalties for violations.

**LEGISLATION.** In 1916 Massachusetts led in important legislation with two bills to protect borrowers. One of these provided that three-quarters of a man's wages shall at all times be exempt from assignment and that no assignment shall be valid unless assented to in writing by the wife and unless made out according to a standard form. The other law prohibits any lender from charging more than 3 per cent per month under any pretext and definitely establishes the manner in which the 3 per cent rate shall be computed.

A bill dealing with regulation of "loan sharks" after a hard struggle passed the Alabama Legislature, but was vetoed by the Governor. In Maryland a bill failed by a close vote. The District of Columbia bill made no substantial progress, while the Federal bill forbidding the use of the mails by lenders carrying on an interstate loan business at rates forbidden by the laws of one of the States affected still remained in its early stages.

**THE NATIONAL FEDERATION OF REMEDIAL LOAN ASSOCIATIONS** held its eighth annual convention in Detroit in early summer. Two new associations in Dayton and Omaha were added to the National Federation during the year, bringing the total membership up to over 40 societies in more than 35 cities in the United States and Canada. They employed more than \$17,000,000 in loan funds. The report of business in 1915 showed 875,000 loans aggregating \$29,000,000, a decided increase over the preceding year. These associations are not charitable but limit their dividends. They have actively aided in the enactment of restrictive legislation.

**ASSOCIATION OF SMALL LOAN BROKERS.** Organizations of State associations of licensed money-lenders have been effected in Ohio, Maryland, Pennsylvania, Illinois, Michigan, and New Jersey. These associations are made up in part of former loan sharks and in part of reputable loan companies which are not eligible for membership in the remedial loan federation because they are distinctly profit-seeking businesses. The avowed purpose of the State associations is mutual protection and the raising of standards in the money-lending business. They have instigated the arrest of unlicensed lenders and have aided in upholding the constitutionality of State laws. These State associations have formed the American Association of Small Loan Brokers. This organization seems likely to be an important factor in elevating the small personal loan business. It is undoubtedly a result of recently enacted laws which permit reasonable interest rates to companies which submit to State license and supervision.

**MORRIS PLAN BANKS.** In 1901 Arthur J. Morris of Norfolk, Va., devised a scheme for extending credit to workmen and other persons of small resources. In 1914 the Industrial Finance Corporation with \$7,000,000 capital was formed to promote banks formed on this plan. The unique feature of the plan is that loans may

be secured by any person either on collateral or on a note signed by himself and two other persons. In the latter case, in addition to the interest, a charge of \$1 for each \$50 loaned is made to cover the cost of investigating the parties to the plan. The plan also provides for the purchase of installment certificates in multiples of \$50 by means of weekly or monthly deposits which may be exchanged for investment certificates bearing 5 per cent interest. More than 30 such banks have been established.

In an opinion of Attorney-General Edward C. Turner, of Ohio, Morris plan banks which had been established in Cleveland, Canton, Springfield, and Youngstown with an aggregate capital of \$750,000 were denied privilege of operating in that State. The opinion held that though chartered as banks the Morris companies were not conducting a banking business; that the actual interest charges for loans were in excess of the rates allowed by the Ohio loan law of 1915; and that the sale of "installment certificates" was in violation of the law regulating bond investment companies, if, as these companies contended, such sale did not involve the making or paying of loans. Steps were taken to secure additional legislation which would give these companies a legal status in Ohio.

**LONDON.** See GREAT BRITAIN.

**LONDON, JACK.** An American author, died near Santa Rosa, Cal., Nov. 22, 1916. Born in San Francisco on Jan. 12, 1876, he was the son of a trapper and frontiersman who had come to that city. Inheriting his father's adventurous disposition, he went to sea at 17, visiting Japan and Bering Sea. In 1893-94 he tramped through the United States and Canada, partly to gather material for his Socialistic articles. He studied for a brief time at the University of California, but in 1897 joined the rush to the Klondike. He afterward started to be a newspaper correspondent in the Boer War, but was prevented by the censorship, went to London in 1902, and in 1904 was a newspaper correspondent in the Russo-Japanese War. He spent the remainder of his life chiefly in California, though interrupting it for journeys abroad by land and sea whenever the humor seized him. In 1906 he fitted out a 50-foot ketchrig yacht and started with his wife on a seven years' cruise around the world, but was forced by a tropical illness to abandon the cruise before it was completed. In 1914 he was a war correspondent in Mexico. London's literary activity had two main aspects: vivid description of outdoor life and adventurous struggle of which the background was his own experience; and Socialistic ideas and sympathies vehemently expressed, together with extreme pacifist principles. In 1915 he wrote a pamphlet entitled "A Good Soldier," in which he denounced the European war and the character and calling of a

soldier as commonly understood, the latter reaching "a depth beyond which we cannot go." The pamphlet was barred from the United States mails. His stories, full of impulsive action and primitive emotion, often sacrifice literary art to a rough virility of speech, but many of them are very popular. They include: *The Son of the Wolf* (1900); *The God of His Fathers* (1901); *A Daughter of the Snows* (1902); *The Call of the Wild* (1903), one of his most widely read books; *The Faith of Men* (1904); *The Sea Wolf* (1904); *The Game* (1905); *Tales of the Fish Patrol* (1905); *Love of Life* (1907); *Before Adam* (1907); *Lost Face* (1909); *Burning Daylight* (1910); *Smoke Bellew* (1912); *The Abyssal Brute* (1913); *The Valley of the Moon* (1913); *The Strength of the Strong* (1914); *The Mutiny of the Elsinore* (1914); *The Scarlet Plague* (1915); *The Star Rover* (1915); *The Little Lady of the Big House* (1916). London's Socialistic or sociological volumes are: *The People of the Abyss* (1903), impressions gleaned from an observation of London slum life; *The Kempton-Wace Letters* (1903); *The War of the Classes* (1905); *The Iron Heel* (1908); *Revolution, and Other Essays* (1910); *John Barleycorn, or Alcoholic Memoirs* (1913).

**LOUISIANA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 1,843,042. The population in 1910 was 1,656,388.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn ..... 1916	2,134,000	44,814,000	\$42,125,000
..... 1915	2,200,000	45,100,000	28,864,000
Oats ..... 1916	110,000	2,090,000	1,421,000
..... 1915	120,000	3,000,000	1,650,000

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments..	2,516	2,211
Average number of wage earners .....	76,165	77,665
Capital invested .....	\$221,816,000	\$261,635,000
Wages .....	33,386,000	39,544,000
The value of materials used	134,865,000	157,886,000
The value of products .....	228,949,000	255,313,000

**MINERAL PRODUCTION.** The output of petroleum in the State in 1915 exceeded the output of 1914 by 3,882,104 barrels, or 27 per cent. It established a new record for production of

oil in the State. The total production was 18,191,539 barrels, valued at \$10,804,653.

**TRANSPORTATION.** The railway mileage of the State including main track and branches on June 30, 1916, was 5316. The railways having the longest mileage are the Texas and Pacific, 805; the Louisiana Railway and Navigation Company, 342; the Louisiana and Texas and Steamship Company, 416; the St. Louis, Iron Mountain, and Southern Railway, 572.

**EDUCATION.** The school population of the State included in 1916, 310,562 white children and 227,557 negro children, or a total of 538,119. The enrollment of white children was 222,073, and of negro children, 98,227. The average daily attendance of white children was 163,722, and of negro children, 72,211. There were 5108 white women teachers and 1140 white men teachers, 975 negro women teachers, and 395 negro men teachers. The average yearly salary of white men teachers was \$711.50, and of white women teachers, \$439.12. The average salary of negro men teachers was \$36 per month, and of negro women teachers, \$30 per month. The net expenditure for educational purposes in 1916 was \$5,701,704.

**FINANCE.** The latest statistics available from the State Treasurer are for the fiscal year 1913. In that year the total receipts were \$8,203,465, and the disbursements, \$7,365,208. At the beginning of the year there was a balance of \$850,025, and at the end, of \$1,062,174.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the Institute for Deaf and Dumb at Baton Rouge, Institute for the Blind at Baton Rouge, Soldiers' Home at New Orleans, Insane Asylum at Jackson, Charity Hospital at New Orleans, Charity Hospital at Shreveport, and a State Penitentiary and Convicts' Farm.

**POLITICS AND GOVERNMENT.** The last two campaigns in Louisiana witnessed the extinction of the Progressive party as a party. The Progressives polled less than 10 per cent of the total vote at the election in 1916, which is less than is required to constitute a party. In 1915 the Progressives bade fair to challenge the Democratic supremacy in the State, but on November 7th the party polled fewer votes than the Republican organization. Primaries for the nomination of Governor were held on Jan. 26, 1916. There were two candidates, Attorney-General Pleasant, who had been Lieutenant-Governor of the State, and James Barret, both of Shreveport. The political machine of New Orleans did not place a candidate in the field, although that city normally polls nearly one-third of the vote of the State. In general the support of New Orleans went to Pleasant, because Barret had declared for State-wide prohibition. In the primary held on January 26th, Pleasant was nominated by a vote of 84,407 to 30,112 for Barret. At the State election held in April the Democratic candidates nominated at the primaries were elected.

Before the Democratic primaries the Progressives in convention had nominated for Governor John M. Parker, a wealthy cotton merchant of New Orleans, who ran both as a Progressive and as an "Independent Democrat." The Democratic vote at the primary indicated that Mr. Parker had no chance in the general election, because it was believed that those who took part in the Democratic primaries would abide by the applied pledge to support the ticket

nominated. The opposition to Pleasant, however, declared that these men were not bound, and Mr. Parker agreed that they were not legally bound. During the campaign Mr. Parker developed strength, and his partisans were confident of his election. There were many who refused to be bound by the applied primary pledge, and openly advocated the election of Parker, though admitting they had participated in the Democratic primary. In the election Mr. Parker polled over 40,000 votes, and the Democratic vote fell from the primary figure by 25,000. The result was hailed by the Progressives as the breaking of the dawn of a new party, a confidence that was destined not to survive. When the new Democratic administration came into power it presented to the Legislature both a new primary and a new general election law. The primary law was intended primarily to cover the bolting from the previous primary, and was bitterly fought by the opposition in the Legislature together with some of the Democrats. It was, however, made a caucus measure, and was placed on the statute books. The essential changes from the former law were that the primary nominations were compulsory with all parties, and to require all primaries to be held on the same day. These clauses were bitterly fought but the greatest opposition was to the clause making it a misdemeanor to vote in the primaries of a party to which the voter had not announced his affiliation when he registered, and to a pledge to be printed on the ticket, which would have the voter agree to support the candidate nominated in his primary. The general election law was changed so as to make its essential provisions stronger, and it provided, as had previous election laws, that the parties which failed to poll 10 per cent of the vote cast in a general election, cease to be parties, in the contemplation of the laws of the State. This law did not affect the Republicans, who had no ticket in the field in the April election, but in the presidential election it eliminated all parties in the State except the Democratic.

There was practically no opposition to the Democratic delegates in the presidential election. The only real contest was in the third Congressional district where Whit Martin was the candidate of the Progressives, and Wade Martin of the Democrats. The Progressive candidate had been elected by a majority of 1426, in the previous Congressional election, and it was believed that he would receive a majority in 1916. The result showed that he received only a majority of 99, and Wade Martin announced his intention to contest the election, because of alleged frauds. The vote for Governor in the election in April was as follows: Pleasant, Democrat, 80,801; Parker, Progressive and Independent Democrat, 48,068. For President the vote was: Wilson, 79,875; Hughes, 6466; Parker, Progressive, 6349; Benson, Socialist, 392. The total vote being 93,082, those parties which fell below 9309 lost their identity as such, leaving the Democratic the only party in the State.

**LEGISLATION.** The Legislature met in 1916 and passed many important measures. A record of these follows:

The laws relating to the procedure of criminal cases were amended. Provision was made that a competent witness in any civil or criminal pro-

ceeding must be a person of "proper understanding," that conversations between husband and wife shall be privileged, and that neither husband nor wife shall be compelled to be a witness on the trial of a criminal procedure against the other. A State board of education was created, of which the State Superintendent of Education is a member. Two constitutional amendments were proposed. The keeping or selling of malt liquors whether or not intoxicating or containing alcohol, in municipalities where the sale of intoxicating liquors is prohibited, is forbidden. It is also unlawful to ship or carry any vinous liquors into any portion of the State where the sale of such liquors is prohibited by law or ordinance, except as provided in this act. The business of lending money on wages is regulated. It is made a misdemeanor for an employer or an officer of a corporation knowingly to fail properly to protect machines or to permit defective machinery in any place of employment. The workmen's compensation law was amended in many points. The laws affecting life insurance were amended, as also were the laws relating to banks and banking. A constitutional amendment was proposed requiring railroads and other corporations in the State to maintain a general office within the State. Absolute divorce on proof of continuous living apart for a period of seven years was authorized. It is made a misdemeanor for parents or others having the custody of children under 17 years of age to abuse or neglect them, or to permit them to be abused or neglected. For changes in the election laws, see *Politics and Government* above. See also *LEGISLATION* in 1916.

**STATE OFFICERS.** Governor, R. G. Pleasant; Lieutenant-Governor, Fernand Mouton; Secretary of State, James J. Bailey; Treasurer, Henry Hunsicker; Auditor, Pau Capdeville; Adjutant-General, C. C. McCrory; Attorney-General, A. V. Coco; Superintendent of Education, T. H. Harris; Commissioner of Agriculture, H. D. Wilson; Commissioner of Insurance, the Secretary of State—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, F. A. Monroe; Associate Justices, O. O. Provosty, A. D. Land, W. B. Sommerville, Charles A. O'Neill.

**LEGISLATURE.** All Democrats except 5 Progressives in Senate, and 12 in House.

**LOUISIANA STATE UNIVERSITY.** A co-educational State institution at Baton Rouge, La., founded in 1860. In the fall of 1916 there were enrolled in the various departments of the university 825 students. Including the executive force and experiment station workers, the faculty numbered 150. The library has 47,617 volumes. President, Thomas Duckett Boyd.

**LOVELL, SIR FRANCIS HENRY.** A British physician, died Jan. 28, 1916, at Hampstead, London. He was born in 1845. From 1878 to 1901 he was connected with the Colonial service, as medical officer of Mauritius, where he was also a member of the Legislative Council, and as surgeon-general and member of the Executive and Legislative Councils of Trinidad and Tobago. He received the C.M.G. in 1893 and was knighted in 1900. For some years before his death, as dean of the London School of Tropical Medicine, he had done much to further the study of tropical diseases.

**LOW, SETH.** An American educator, publicist, and civic official, died on Sept. 17, 1916,

at his country home, Broad Brook Farm, near Bedford Hills, New York. He was born in Brooklyn, N. Y., on Jan. 18, 1850, and was educated at the Brooklyn Polytechnic Institute and at Columbia University, where he graduated in 1870. Shortly afterward he entered the tea-importing house founded by his father in New York City, was admitted a member of the firm in 1875, and retired in 1888, having acquired a large fortune. In 1878 he organized and became the first president of the Brooklyn Bureau of Charities, one of the first societies to promote coöperation and to prevent waste and fraud in charity service. He became prominent in civil service reform, carrying out his ideas while mayor of Brooklyn in 1882-86, having been twice elected on an independent ticket. In 1890 he was elected president of Columbia University, succeeding Dr. F. A. P. Barnard in that office. Under his skillful administration the university greatly increased in resources, number of students, and general standing. The site was transferred to valuable property on Morningside Heights, where new buildings for special schools were erected, and mainly through his efforts were vitally united into a university. The Low Memorial Library at Columbia, erected by him in honor of his father, Abiel Abbot Low, and architecturally one of the finest buildings in the United States, cost \$1,000,000. In 1897 he was an independent candidate for mayor of Greater New York, but was unsuccessful. He was a member of the American delegation to the peace conference at The Hague in 1899, and in October, 1901, he resigned the presidency of the university and was elected mayor of Greater New York on a fusion ticket. He filled that position from Jan. 1, 1902, to Dec. 31, 1903, having given the city a clean and progressive administration along the lines he had introduced in Brooklyn. In 1903 he was a candidate for reelection, but was defeated by George B. McClellan. From 1881 to 1914 he was a trustee of Columbia. He served at various times as president of the Archaeological Institute of America, the New York Academy of Political Sciences, the American Asiatic Society, the American Geographical Society, the National Civic Federation, and the New York Chamber of Commerce. Honorary degrees were given him by Amherst and Trinity colleges, and by Harvard, Princeton, Yale, Edinburgh, and Columbia universities, by the University of the State of New York, and the University of Pennsylvania. In 1914 President Wilson appointed him one of a commission of three to settle the Colorado coal strike. In 1915 he served as delegate-at-large to the State Constitutional Convention. In 1916, up to the time his illness became acute, he was engaged in the work of conciliation between railway employees and employers, and in the affairs of the National Civic Federation.

**LOWDEN, FRANK O.** Elected Republican Governor of Illinois, Nov. 7, 1916.

**LOWELL, AMY.** See LITERATURE, ENGLISH AND AMERICAN, *Poetry*, American.

**LOWELL, PERCIVAL.** An American astronomer, traveler, and author, died Nov. 13, 1916, at Flagstaff, Ariz. He was a brother of A. Lawrence Lowell, president of Harvard University, and a cousin of the poet, James Russell Lowell, and was born in Boston, March 13, 1855. He was educated at the Boston Latin School

and at Harvard University, where he graduated in 1876. In 1883 he went to Japan, where he lived until 1893. He then returned to the United States, and in 1894 established the Lowell Observatory at Flagstaff, Ariz., but remained closely connected with the Harvard Observatory. In 1894 he was counselor and foreign secretary to the Korean special commission in the United States. In 1902 he was appointed non-resident professor of astronomy at the Massachusetts Institute of Technology, and made discoveries on the planets Mercury, Venus, Saturn, and especially Mars. He supported the theory of Schiaparelli that there are canals on the last-named planet and also living, intelligent beings. For his researches on Mars he received the Janssen medal of the French Astronomical Society in 1904, and in 1908 a gold medal from the Sociedad Astronomica of Mexico. In 1910 Dr. Lowell maintained his views about Mars in his lectures before the Royal Institute in London and the Association Astronomique in Paris. His arguments aroused considerable opposition, but were accepted by some astronomers. He was a member of several learned societies and received honorary degrees from many universities. His publications include: *Choson* (1885), a sketch of Korea; *The Soul of the Far East* (1886); *Nota, an Unexplored Corner of Japan* (1891); *Occult Japan, or the Way of the Gods* (1895); *Mars* (1895); *Annals of the Lowell Observatory*, vol. i, 1898, vol. ii, 1900, vol. iii, 1905; *The Solar System* (1903); *Mars and Its Canals* (1906); *Mars as the Abode of Life* (1908); *The Evolution of Worlds* (1909). See ASTRONOMY.

**LOWTHER, SIR GERARD AUGUSTUS.** A British diplomat, died at Sandwich, April 5, 1916. A nephew of the third Earl of Lonsdale and grandson of Lord Wensleydale, Sir Gerard Lowther was born in 1858. He was educated at Harrow, and entered the diplomatic service at 21. After being connected with legations and embassies for some years, he received his first major appointment, as minister to Chile in 1901. Three years later he was transferred to Tangier, as minister and consul-general, and from 1908 to 1913 was ambassador at Constantinople. He was made a privy councillor in 1908, a G.C.M.G. in 1911, and a baronet in 1914. His wife, the daughter of Atherton Blight of Philadelphia, became known for her work in behalf of Turkish refugees while in Constantinople. Lowther himself had a difficult situation to face in Turkey, because of the uncertainty of the British attitude toward the Young Turk activities and German influence.

**LOYOLA UNIVERSITY.** A Roman Catholic institution in Chicago, Ill. As St. Ignatius's College, it was founded in 1870. The corporate name was changed in 1909. It is co-educational in its graduate departments. In the fall of 1916 the enrollment was as follows: Arts 121, sociology 260, medicine 292, law 118, pharmacy 61, and engineering 38. The faculty numbered 147. There were no important changes in the faculty, or large gifts during the year. The library contains 50,000 volumes. President, John Baptist Furay.

**LUBLINITE.** See MINERALOGY.

**LUCAS, E. V.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, English; *Essays*, English.

**LUCCOCK, NAPHTALI.** An American Methodist Episcopal bishop, died at Lacrosse, Wis., April 1, 1916. He was born at Kimbolton, Ohio, in 1863, and after graduating from Ohio Wesleyan University in 1874, received higher degrees there and at the University of Western Pennsylvania (University of Pittsburgh). Meanwhile he had been ordained and for three years had served as professor in Allegheny College. Syracuse University gave him the degree of D.D. in 1886. Later he became minister of the Union Methodist Episcopal Church in St. Louis, and at the time when he was elected bishop (1912) occupied the pulpit of the Hyde Park Church in Kansas City, Mo. Bishop Luccock was stationed at Helena, Mont., and died on his way to New York City. He was the author of sermons published as *The Royalty of Jesus* (1906), and, with others, of an *Illustrated History of Methodism* (1901).

**LUNACY.** See **INSANITY.**

**LUNGMOLE.** See **RESUSCITATION.**

**LUTHER, MARTIN.** See **GERMAN LITERATURE, New Editions.**

**LUTHERANS.** The Lutheran Church is the third largest denomination in the United States, where it had, in 1916, 3,774,774 baptized members (including Canadian members), 2,445,276 confirmed members or communicants, 15,069 churches, 9831 ministers. In Canada, according to the latest available statistics, there were 229,864 communicants, 133 ministers, and about the same number of churches. In Canada the Lutheran church conducts services in 13 different languages. The value of Lutheran church property in the United States and Canada in 1916 was \$102,320,045. No form of church government is held to be essential, and the services and organization are carried on under Congregational, Presbyterian, and Episcopal forms. There are five general church bodies: the General Council, founded 1867; General Synod, founded 1820; Synodical Conference, founded 1872; United Synod South, founded 1886; United Norwegians; also a number of independent synods.

**GENERAL COUNCIL.** The General Council in the United States in 1916 had 517,931 confirmed members or communicants, 2606 churches, 1753 ministers.

**GENERAL SYNOD.** In 1916 there were 360,749 communicants, 1847 churches, and 1425 ministers.

**SYNODICAL CONFERENCE.** There were in 1916 827,056 communicants, 3901 churches, and 3268 ministers.

**UNITED SYNOD SOUTH.** There were in 1916 72,462 communicants, 494 churches, and 261 ministers.

**UNITED NORWEGIAN.** In 1916 there were 173,534 communicants, 1650 churches, and 650 ministers.

**INDEPENDENT SYNODS.** There were in 1916, excluding the United Norwegian, 511,344 communicants, 4571 churches, and 2474 ministers.

For 1916 the Lutherans reported a gain of 11,092 members. There are 14 American societies of foreign missions, with 323 missionaries, 1722 native helpers, 87,885 native Christians, 28,950 pupils in mission schools, and an income of about \$560,000. On account of the European war no data for 1915-16 are available concerning the 35 European societies engaged in foreign missions. The work of for-

eign societies is much interrupted, many missionaries being seized and held as prisoners of war. The Lutherans have 29 theological seminaries, 41 colleges, and 60 academies, and 9 ladies' colleges and seminaries.

Among the synods of the general council in 1916, that of Pennsylvania revised its constitution and established a salaried presidency, the president being elected for a term of five years and eligible for reelection. Of the \$500,000 educational fund \$334,885 was raised at the time of the convention in New York. The ministerium decided to signalize the 400th anniversary of the Reformation by raising \$100,000 for the Jubilee Fund, all of which will go to educational uses. The Pittsburgh synod raised \$50,000 for the Home for the Aged at Zelienople. The synod of Canada had no convention in 1916 on account of the war; all the other Canadian synods were hindered in their work for the same reason.

**LUXEMBURG.** An independent, neutral grand duchy, bordering Belgium, Germany, and France. The area is 2586 square kilometers (998 square miles). Population (Dec. 1, 1910), 259,891 (134,101 males, 125,790 females). Roman Catholics numbered 250,543, Protestants, 4007, and Jews, 1270. Natives of the grand duchy numbered 220,168; there were 21,762 Germans, 10,138 Italians, 3964 Belgians, and 2103 French. Luxembourg, the capital, had 20,848 inhabitants. Iron mining is an important industry; production 1914, 1,827,270 metric tons. The grand duchy is included in the German customs union. Railways (1913), 325 miles; telegraphs, 439 miles, with 1352 of wire; post offices, 140. The budget for 1916-17 showed estimated revenue of 17,492,305 francs and estimated expenditure of 23,334,661 francs. Customs and direct taxes each supply about one-fourth of the revenue. The debt amounts to 12,000,000 francs; annuities, 493,150 francs. The amount paid by Germany after the invasion on Aug. 2, 1914, is estimated at \$250,000. The chamber of deputies consists of 53 members, elected for six years by direct vote. The grand duke, William, died Feb. 25, 1912, and was succeeded by his daughter, Marie Adelaide (born June 14, 1894), who was enthroned on attaining her majority, June 14, 1912. Her sister, Princess Charlotte (born 1896), is heir-ess-presumptive.

The serious difficulties with the government that had arisen in 1915 continued. The minister of state, Dr. Lautsch, had dissolved the Diet November 12th. Upon its reassembling in January, it again showed its discontent, going so far as to break out into disorder and throw chairs out of the window. It voted no confidence by a vote of 26 to 25, whereupon Dr. Lautsch resigned and the Grand Duchess Marie called ex-Premier Vannerus on January 28th to form a ministry. He, however, fell from power on February 21st, and finally a Catholic Liberal Socialist Coalition succeeded in forming a cabinet under M. Thorn, which received a vote of confidence of 39 to 1.

**LYAUTEY, HUBERT.** See **FRANCE.**

**LYMAN, FRANCIS MARION.** An American Mormon official, president of the Quorum of the Twelve Apostles in the Mormon Church, and next in succession to President Joseph F. Smith, died at Salt Lake City, Utah, Nov. 18, 1916. He was born in 1840, in Goodhope, McDonough

County, Ill., went with his father in 1851 to San Bernardino, Cal., then an outfitting point for Latter Day Saints, and received his early education there. In 1860 he was ordained one of the Seventy Elders of the Mormon Church, later settled in Utah, went to England as a missionary in 1862, and returned with over 800 converts. After holding various civic and administrative positions in Utah and serving in the State Legislature, being at the same time engaged in the flour and grain trade and other business enterprises, he was elected one of the Twelve Apostles in 1880, and afterward devoted himself wholly to church work, except for a short term in the State Legislature. He made a second missionary trip to England in 1873, and a third more extended foreign trip in various countries in 1901-04, being chosen president of the Council of the Twelve Apostles during his absence in 1903. Lyman's testimony at the Reed Smoot hearing before the United States Senate Committee on Privileges and Elections made a sensation. He then confessed his own polygamy, and asserted the polygamy of President Joseph F. Smith, and of the Mormon apostles in direct succession. He said that he knew he was living in disobedience to the law of the land and expected so to live. Under severe cross-examination his evidence was shown to be contradictory, but although he was placed in an unfavorable light before the public his standing in the Mormon Church was not seriously affected.

**LYNCHINGS.** Statistics were published at the close of the year by the Tuskegee Institute of Alabama showing the number of lynchings during the year 1916. According to this, the total was 54, of whom all but 4 were negroes; 47 men and 3 women. The largest number of lynchings occurred in Georgia, 14; next came Florida with 8, and Arkansas and Oklahoma, 4 each.

**MABLE, HAMILTON WRIGHT.** An American essayist, editor, critic, and lecturer, died Dec. 31, 1916, at Summit, N. J. He was born at Cold Spring, N. Y., on Dec. 13, 1846, graduated from Williams College in 1867 and from the Law School of Columbia University in 1869. In 1879 he joined the editorial staff of the *Christian Union*, afterward called the *Outlook*, of which he became associate editor. He received honorary degrees from his alma mater, from Union College, from Western Reserve, and from Washington and Lee University, and became a member of the American Academy of Arts and Letters. His writings, with one or two exceptions, are essays and familiar talks on literature, nature, and the spiritual life, and are distinguished by breadth of view, felicitous language, and a high moral and religious tone. In 1913 he went to Japan on a peace mission under the auspices of the Carnegie Foundation for Peace, and made many speeches that were successful to a considerable extent in allaying the anti-American feeling then prevalent in certain parts of Japan. His publications include: *Norse Stories, Retold from the Eddas* (1882); *Nature in New England* (1890); *My Study Fire* (two series, 1890 and 1894); *Essays in Literary Interpretation* (1892); *Essays on Books and Culture* (1897); *Essays on Work and Culture* (1898); *The Life of the Spirit* (1899); *William Shakespeare, Poet, Dramatist, and Man* (1900); *Parables of Life* (1902); *Essays on Nature and*

*Culture* (1904); *Introductions to Notable Poems* (1909); *American Ideals, Character, and Life* (1913); and *Japan To-day and To-morrow* (1914).

**MACAO.** A Portuguese dependency, consisting of the island of Macao and two islets at the mouth of the Canton River, China. Area, 4 square miles. Population (1910 census), 74,866; Chinese numbered 60,057; whites, 3019, of whom Portuguese, 3780. The port and city of Macao are important in transit trade with south China.

**MCCABE, JOSEPH.** See LITERATURE, ENGLISH AND AMERICAN, *History and Essays*, English.

**MCCALL, SAMUEL W.** Re-elected Republican Governor of Massachusetts Nov. 7, 1916. See MASSACHUSETTS; also LITERATURE, ENGLISH AND AMERICAN, *History, etc.*, American.

**MCCCLINTOCK, EMORY.** An American insurance official, died at Bay Head, N. J., July 10, 1916. He was born in Carlisle, Pa., in 1840, and after graduating from Columbia University in 1859, served for a short time as tutor, and in 1863 was appointed United States consular agent at Bradford, England. Returning to New York, he was actuary of the Ashbury Life Insurance Company from 1867 to 1871, and afterward actuary of the Northwestern Mutual Life till 1889. In that year he became connected with the Mutual Life of New York, of which he was vice-president and trustee in 1905-11, and consulting actuary and trustee thereafter. Mr. McClintock served as president of the American Mathematical Society from 1890 to 1894, and as president of the Actuarial Society of America from 1895 to 1897. The American Academy of Arts and Sciences elected him one of its honorary fellows, and the Institute of Actuaries, London, a fellow. Honorary degrees came to him from Wisconsin, Columbia, and Yale universities.

**MCCORMICK, VANCE CRISWELL.** See UNITED STATES, *Presidential Campaign*.

**MCCUMBEE, PORTER JAMES.** Re-elected Republican United States Senator from North Dakota Nov. 7, 1916.

**MCCURDY, RICHARD ALDRICH.** An American insurance official, died at Morristown, N. J., March 6, 1916. He was born in New York Jan. 29, 1835, son of Robert H. McCurdy, a director of the Mutual Life Insurance Company. Richard A. McCurdy, having graduated in law from Harvard in 1856, formed a partnership with Lucius Robinson, who was afterward Governor of New York, and early became prominent in civic affairs. In 1860 he was appointed counsel for the Mutual Life, and in 1865 was elected vice-president. From 1885 till his resignation in 1906 he was its president, and as such became known as one of the three biggest figures in insurance in the United States, the others being Henry B. Hyde of the Equitable and John A. McCall of the New York Life. Popularly he was supposed to be more powerful than either of these. It had been known that he lived in great luxury, but it was not until the Armstrong investigation of 1905, conducted by Charles E. Hughes, that the public learned details. It appeared that Mr. McCurdy had been given a salary of \$30,000 when he was chosen president of the Mutual, that later this was raised to \$100,000, and finally to \$150,000. He stated on the witness stand that he had never sought an increase and had accepted it simply

as recognition of his services. It was brought out that his son, Robert H. McCurdy, and a son-in-law, Louis A. Thébaud, also received very large incomes from the Mutual, in salaries and commissions. The three built palatial residences in Morristown, the elder Mr. McCurdy's costing, it was estimated, \$1,000,000. Counting in the provision made for other relatives, the total annual remuneration for the family was reckoned to be about \$529,800. The president's power in the Mutual was virtually autocratic. His offices were fitted up as none had ever been before, adorned with costly woods, marble, and works of art.

On the stand Mr. McCurdy appeared indignant that inquiry should be made into what he considered his private affairs. He said he knew nothing whatever about the profits of the company, that it was run as a great benevolent institution, without regard to profits. It was a fact, however, that the Mutual had grown to the point where its assets nearly equaled the combined assets of the Bank of England, the Bank of France, and the Bank of Germany. When informed of policy-holders' complaints regarding shrinkage in dividends, Mr. McCurdy proved to be equally unfamiliar with that side of the business. Nor did he profess to know anything about the relations of his company with politics. The investigation brought out the existence of legislative agents of the Mutual at Albany who maintained what was known as the "House of Mirth" for the assistance of legislators whose help was needed at the capitol. In political contributions tens of thousands of dollars were spent annually. At the close of the investigation, Mr. McCurdy asked to have his salary reduced to \$75,000, and shortly afterward he resigned. His relatives also severed their connection with the company. The Mutual Life brought suits against the former president and other officers to recover \$8,000,000 said to have been improperly taken or expended from the funds of the company. These claims were settled for \$815,000. Broken in health by the ordeal, Mr. McCurdy made a long sojourn abroad and afterward lived quietly in Morristown.

**McCUTCHEON, GEORGE BARR.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction, American.*

**MACEDONIA.** Anciently a country north of Thessaly on the northwest shore of the Ægean Sea. This region has no definite political boundaries, but corresponds nearly to the modern Turkish vilayet of Saloniki and the eastern part of the vilayet of Monastir; it came to be commonly termed Macedonia in the nineteenth century, when it was often prominent as the scene of racial strife, especially that of the various nationalities settled there (Bulgar, Serb, Greek, etc.) with the dominating Turk. The Ottomanization of the country, more vigorously prosecuted after the Turkish revolution of 1908, provoked in 1912 the coalition of Bulgaria, Serbia, Montenegro, and Greece against Turkey; the latter, defeated in the first Balkan War, of 1912-13, ceded most of her European dominions to the victorious Christian powers. Macedonia was partitioned in 1913 among Greece, Serbia, and Bulgaria, the greater part being taken by Greece. See WAR OF THE NATIONS.

**MacGILL, PATRICK.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction, English.*

**McGILL UNIVERSITY.** A Canadian educational institution at Montreal. It was founded in 1821 and reorganized in 1852. The enrollment has been greatly reduced by the European war. In the fall of 1916 there were 1052 students and 254 faculty members, divided among the faculties of arts, medicine, law, applied science, and agriculture. During the year Dr. James Douglas gave \$150,000 for the erection of students' residences. Sir W. C. Macdonald gave \$26,000 for the construction of a filtration plant at Macdonald College, affiliated with the university. By legacy \$20,000 was received from Guy M. Drummond. The productive funds of the institution amount to \$8,682,119, and the income from all sources in 1916 was \$770,938. In the university library are 154,000 volumes and in the medical library 40,000 volumes. Principal, Sir William Peterson.

**MACH, ERNST VON.** An Austrian physicist and psychologist, died in Vienna Feb. 19, 1916. He was born at Turas, Moravia, Feb. 18, 1838, was educated at Vienna, and was professor successively at Graz, Prague (where he was rector magnificus in 1879-80), and Vienna, where he remained for six years (1895-1901). Upon his retirement he was appointed member of the Austrian House of Peers. Mach devoted himself to pure physics, to the history and philosophy of this subject, and to the relation of physics to psychology, and in these fields, particularly the last named, he made notable contributions. He was probably the leading philosophical scientist of his time. The work published in 1886 and translated into English as *The Analysis of Sensations and the Relation of the Physical to the Psychical* attracted wide attention. Other of his important writings that have appeared in English are: *The Science of Mechanics* (with supplementary volume); *Popular Scientific Lectures*; *Space and Geometry in the Light of Physiological, Psychological, and Physical Inquiry*; *The History and the Root of the Principle of the Conservation of Energy*. The publishers have announced the following as in course of preparation: *Civilization and Mechanics*; *Theory of Heat*; and *Cognition and Error*.

**McLEAN, EMILY NELSON RITCHIE** (Mrs. Donald McLean). An ex-president-general, and at her death, honorary president-general, of the Daughters of the American Revolution, died in Baltimore, Md., May 19, 1916. The daughter of Judge John Ritchie of Frederick, Md., she was born in 1859, graduated from Frederick Seminary in 1873, and later specialized in languages, history, and mathematics. She was married to Donald McLean, a lawyer of New York,

in 1883. and her home was thereafter in that city. Mrs. McLean was a charter member of the D. A. R., and for 10 years was regent of the New York Chapter, before 1905, when she was elected president of the national organization, succeeding Mrs. Charles Warren Fairbanks. Previously, the holder of this office had always been the wife of some government official. Mrs. McLean became noted for her remarkable executive ability, and in addition she traveled much, lecturing on patriotic and educational subjects. In her honor a scholarship was established at Barnard College, and a lecture course at the Memorial Continental Hall, in Washington. She was a member of the Colonial Dames, and of other organizations.

**McLEAN, GEORGE PAYNE.** Reflected Republican United States Senator from Connecticut Nov. 7, 1916.

**McLEAN, JOHN ROLL.** An American newspaper owner, died at his suburban home at Friendship, near Washington, June 9, 1916. He was born in 1848 in Cincinnati, Ohio, studied there and at Harvard, and returned to identify himself with his father's paper, the Cincinnati *Enquirer*, on which he was first office boy and later police reporter. His father sold him a half interest in 1872, and in 1881 he became sole owner. Mr. McLean early became prominent in Democratic politics, and he had been a delegate at large to the national conventions of his party since 1884. At various times he had been a candidate for Governor of Ohio, United States Senator, and for the Democratic presidential nomination. For a while he owned the New York *Evening Journal*, which he sold to William Randolph Hearst. The Washington *Post* he bought in 1905; this had since been one of his chief interests. His fortune, estimated at upwards of \$100,000,000, was made largely in real estate and in public service corporations. He owned much land in Cincinnati, as well as Western mining property, and for many years was president of the Washington Gas Light Company, owned a large hotel in Washington, and was a large stockholder in the Capital Traction Company.

**MacMILLAN, DONALD B.** See POLAR RESEARCH, *Arctic*.

**MADAGASCAR.** A great island in the Indian Ocean, off the east coast of Africa; a French colony, covering 585,300 square kilometers (225,984 square miles) and having a population (1914) of 3,253,581 (with dependencies, 3,293,552). Antananarivo (Tananarive) is the capital, with 72,000 inhabitants; Fianarantsoa has about 7000; Tamatave, 7026; Majunza, 4600. Madagascar is divided for administrative purposes into 19 provinces, 3 circles, and 1 autonomous district. The Hova is the dominant tribe. Agriculture is the leading industry and rice the staple native crop. Cattle-raising is important. The Europeans resident in the colony cultivate coffee, tobacco, sugar-cane, hemp, cotton, vanilla, tea, etc. The forest products are valuable. Sericulture is carried on. The mines yield gold, silver, iron, copper, lead, and zinc. Native manufactures include silk and cotton goods and fabrics. Trade and finance statistics are given below in francs:

	1910	1911	1912
Imports	84,595,000	46,057,000	46,747,456
Exports	47,883,000	52,378,000	56,054,377
Budget	30,750,000	31,153,000	.....

The trade for 1914 is reported from a British source at £1,894,266 imports and £1,857,330 exports; the 1914 budget balanced at £1,440,717 and the 1915 budget at £1,507,839.

Tonnage entered in the 1914 trade, 1,910,142. Of railways, there are 368 kilometers. A railway connects Brickaville with the capital, with an extension from Brickaville to Tamatave. The Antananarivo-Tamatave line was completed early in 1913. Telegraph lines 7192 kilometers, wires 12,297; telephone lines, 1381 kilometers; post offices, 171. The colony is administered by a governor-general.

**MAINE. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 774,914. The population in 1910 was 742,371.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn	15,000	645,000	\$768,000
1915	16,000	658,000	558,000
Wheat	5,000	135,000	252,000
1915	4,000	112,000	125,000
Oats	170,000	6,120,000	4,100,000
1915	175,000	7,000,000	3,150,000
Potatoes	125,000	25,500,000	86,210,000
1915	142,000	25,418,000	17,793,000
Hay	1,200,000	1,740,000	21,576,000
1915	1,150,000	1,322,000	19,695,000
Barley	6,000	156,000	162,000
1915	5,000	132,000	99,000
Buckwheat	14,000	386,000	319,000
1915	13,000	338,000	237,000

c Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments	3,546	3,378
Average number of wage earners	79,955	82,149
Capital invested	\$202,260,000	\$238,844,000
Wages	87,632,000	43,254,000
The value of materials used	97,101,000	117,655,000
The value of products	176,029,000	200,450,000

**TRANSPORTATION.** The total railway mileage of the State on June 30, 1916, was 2289. The railroads having the longest mileage are the Maine Central, 1007, the Bangor and Aroostook, 631, and the Canadian Pacific, 177. There was no construction of track during the year.

**EDUCATION.** The school population of the State on April 1, 1915, was 225,013. The registration in the schools was 113,036. The total number of teachers was 6273. The average salary of male teachers per month was \$53.04, and of female teachers \$10.77 per week. The total school revenue from local taxation and from State school funds was \$2,098,355.

**FINANCE.** The report of the State Treasurer

for the fiscal year 1916 shows a balance on Jan. 1, 1916, of \$1,158,938. The receipts from all sources during the year were \$6,865,855, and the disbursements \$6,551,676, leaving a balance on Dec. 31, 1916, of \$1,473,118. This is the largest cash balance ever recorded in the department at the close of any fiscal year. The amount represents nearly three mills on the State valuation, and is equal to more than one-half of the State tax assessed in any one year in the history of the State. On Jan. 1, 1916, the bonded debt was \$1,522,000. An issue of \$500,000 in 20 year State highway bonds was sold on March 1, 1916.

**CHARITIES AND CORRECTIONS.** The charitable institutions include State Hospitals at Augusta and Bangor, the Maine School for Feeble-Minded, and the Bath Military and Naval Asylum at Bath. The correctional institutions include the Maine Industrial School for Girls at Hallowell, the State School for Boys at South Portland, and the Maine State Prison at Thomaston. The total expenditures for the maintenance of these institutions is about \$1,000,000 per year.

**POLITICS AND GOVERNMENT.** The year 1916 in Maine opened with a Democratic State government. Early in the year, under the direction of the chairman of the Republican State committee, meetings were held successively in each county in the State, at which Progressive leaders were induced to advocate concessions tending to a practical reunion of the parties. These were called "get-together meetings." Under the influence of these, amalgamation had progressed so far that by March 23, 1916, when the State Republican Convention was held at Portland, the Republican platform included the leading policies of both the Republican and Progressive parties with special emphasis on the Republican national platform of 1908. It was found to be so satisfactory to both elements that it was enthusiastically accepted in a public mass meeting on the night preceding the opening of the convention, and by this meeting was recommended to the convention for its adoption.

Hon. William T. Cobb, ex-Governor of Maine, presided at the convention, which was held in Portland City Hall, and the principal address was by United States Senator William Alden Smith of Michigan. Delegates to the national convention, over the choice of which it had been feared there would be a party split, were named by acclamation and were uninstructed by the convention. It was the general understanding that they were to go as free-agents, and that if a union be reached in favor of ex-Governor Hughes, it would be satisfactory. To indicate how true this understanding was it may be said that the delegates to the national Republican convention in Chicago cast votes for Hughes, Roosevelt, Weeks, and Root, dividing on all the ballots until the last, when they voted solidly for Hughes.

The Democratic State convention was held in Bangor, March 29th, and its delegates were instructed for President Wilson.

The primary elections were held June 19th. There were no contests of importance in the Democratic primaries, five candidates for Governor, four for United States Senator, and a multitude of candidates for minor offices filed papers in the Republican primaries and kept the State in political turmoil up to the date of the primaries, resulting in the nomination for

Governor of Carl E. Milliken by a plurality of over 8000 votes over his nearest competitor, Frederick H. Parkhurst of Bangor, and the nomination for United States Senator of Frederick Hale of Portland, who led ex-Governor Fernald of Poland by 1500 votes, and Ira G. Hersey of Houlton by 3500, with a total vote of rising 45,000. The Democrats nominated Oakley C. Curtis of Portland for Governor, and re-nominated Charles F. Johnson of Waterville for United States Senator. The Republicans nominated Louis B. Goodall of Sanford for Congressman from the first district, Wallace H. White, Jr., of Lewiston, second district, John A. Peters of Ellsworth, third district, and Frank E. Guernsey of Dover, fourth district. The Democrats nominated John Clarke Scates of Westbrook for Congress from the first district, Daniel J. McGillicuddy of Lewiston, second district, John E. Bunker of Bar Harbor, third district, and Leonard A. Pierce of Houlton, fourth district.

The death of United States Senator Edwin C. Burleigh at Washington June 16th, two years before the expiration of his term of office, occasioned an extra primary election to nominate candidates to be voted for in September to fill Senator Burleigh's unexpired term. The Republican candidates were ex-Gov. Bert M. Fernald and Ira G. Hersey. Before the filing of papers Mr. Hersey withdrew and Congressman Frank E. Guernsey of Dover, resigning his candidacy for Congress in the fourth district, became a candidate for the Senate. The Democrats nominated Kenneth C. M. Sills of Brunswick, without opposition, and in the special primary of July ex-Governor Fernald won the nomination over Congressman Guernsey by a plurality of 632 votes in a total of 18,000 in the Republican primaries and 4500 in the Democratic. Later, in convention at Bangor, Ira G. Hersey of Houlton was nominated for Congress by the Republicans to fill the vacancy on the ticket caused by the resignation of Congressman Guernsey.

The gubernatorial elections were held on September 9th. The preliminary campaign was the most exciting known in Maine for many years. Governor Hughes, Republican candidate for President, toured the State, and at Lewiston made his first aggressive speech on labor legislation; Colonel Roosevelt made a speech at Lewiston which attracted crowds from every section of Maine. The chief contest was over the two United States Senators and four Congressmen, especially the Congressman from the second district, then represented by Mr. McGillicuddy, Democrat. State issues were but little discussed. The speaking bureau of the Democratic and Republican national campaign committees sent to Maine the most brilliant orators of the nation. The result was a victory for the Republicans on both State and national tickets. Carl E. Milliken of Island Falls was elected Governor by over 13,000 plurality. Frederick Hale of Portland (Rep.) was elected to the United States Senate for the long term, defeating Charles F. Johnson (Dem.), candidate for reelection, and ex-Gov. Bert M. Fernald (Rep.) was elected to fill the unexpired term of Senator Burleigh, the pluralities in both cases being approximately 13,000. All four Republican Congressmen were elected, W. H. White, Jr., defeating Congressman McGillicuddy in the second district by a majority of over 750. The Republican House and Senate were elected for the

State and with but few exceptions the Republican county tickets were elected.

No campaign was made for presidential electors. The vote of Maine in November was: Hughes and Fairbanks 69,506; Wilson and Marshall 64,118; Benson and Kirkpatrick (Soc.) 2186; Hanly and Landreth (Pro.) 595; Republican plurality 5388. The official vote of Maine in September for Governor was Carl E. Milliken (Rep.) 81,317; Oakley C. Curtis (Dem.) 67,719; Frank H. Maxwell (Soc.) 1538; Linus Seeley (Pro.) 249.

**LEGISLATION.** A special session of the Maine Legislature was held September 29th-October 3rd, at which the report of the committee on revision of the statutes of Maine was enacted into law, and four bills of minor importance were enacted.

On October 10th five officers of the Aroostook County Potato Shippers Association were found guilty under the Sherman Act in a conspiracy in restraint of trade. Evidence introduced by the government during the trial showed that the defendants had blacklisted dealers in potatoes who failed to conduct their business in accordance with the wishes of the association. The defendants claimed immunity under the Clayton Amendment to the Sherman Anti-Trust Law, on the ground that the organization was an agricultural organization, and exempt from prosecution.

The first national park east of the Mississippi River comprising 5000 acres was created on Mountain Desert Island in July. The tract is known as Sieur de Montes National Monument. The land was donated to the Federal government. Its northern boundary is about a mile from Bar Harbor and there are several popular summer resorts near by. Within the park are ten mountain peaks and four lakes.

**STATE OFFICERS.** Governor, Carl E. Milliken; Secretary of State, John E. Bunker; Treasurer, Elmer E. Newbert; Adjutant-General, George McL. Presson; Auditor, Roy L. Wardwell; Attorney General, William R. Patangall; Superintendent of Public Schools, Glen Starkey; Insurance Commissioner, Erastus J. Carter; Commissioner of Agriculture, W. T. Guptill—all Democrats except Milliken and Wardwell, Republicans. Election Jan. 4, 1917, except for Governor, Auditor, and Superintendent of Public Schools.

**JUDICIARY.** Supreme Judicial Court: Chief Justice, Albert R. Savage; Associate Justices, L. C. Cornish, G. E. Bird, A. W. King, George F. Haley, George M. Hanson, Warren C. Philbrook; Clerk, C. W. Jones.

STATE LEGISLATURE.

	Senate	House	Joint Ballot
Republicans .....	28	105	133
Democrats .....	3	46	49
Republican majority ..	25	59	84

**MAINE, UNIVERSITY OF.** A State co-educational institution, founded at Orono, Me., in 1862. In the fall of 1916 the total enrollment was 1272 and the faculty numbered 155. In 1916 a department of music was established with Adelbert W. Sprague, of Bangor, at its head. Professor Sprague will also act as instrumental and choral conductor and coach. Dr. Ralph Harper McKee, head of the department of chem-

istry, resigned and was succeeded by Dr. Charles W. Easley. The productive funds of the institution amount to \$200,000 and the total income for 1916 from all sources was \$357,540. The library contains 60,000 volumes. President, Robert Judson Alely.

**MAINE FESTIVAL.** See MUSIC, *Festivals.*

**MAIZE.** See CORN.

**MALACCA.** One of the Straits Settlements (q.v.), in the southern part of the Malay Peninsula.

**MALARIA.** R. Ross has attempted to estimate the infectivity of the mosquito in malaria, and concludes that approximately one out of 24 anophelines manages to bite a human being, and that this proportion is greatly reduced as to infectivity since less than 25 per cent succeeded in transmitting the plasmodium. Roughly it may be considered that one out of every 100 female anophelines in a malarial country is a possible carrier of the disease. The United State Public Health Service has recently conducted a series of experiments on human subjects, an account of which is found in Public Health Reports, 1916, xxxi, 2325. These tests show that even short exposure to bites, where mosquitoes are interrupted in their feeding, is sufficient for the successful transmission of the disease. In 17 experiments in which human beings were employed to test the infectibility of *Anopheles punctipennis* with *Plasmodium vivax*, 14 cases of malarial fever resulted. In an attempt to infect several persons with a single insect, one mosquito proved to be the sole infective agent in one experiment, and one proved to be the sole infective agent in three tests.

There is no evidence that the mosquito is in any way harmed by the malarial parasite it harbors; but the ability of an infected insect to strike repeated blows before its power to transmit malaria has been lost can scarcely be doubted. As proved by Ross in 1898 (see YEAR BOOK, 1898) the spores of the malarial plasmodium are concentrated in the salivary gland of the mosquito.

Salvarsan as a cure for chronic and severe forms of malarial infection which are unresponsive to quinine has been used by various observers ever since its discovery, the arsenobenzol preparation being germicidal to the protozoa of malaria as well as to the spirochete of syphilis and other organisms of the same class. Neff of Kansas City reports a series of five cases in children treated with diarsenol (the Canadian preparation resembling salvarsan), with entire success, except that the spleen did not entirely return to its normal size. The peripheral blood was promptly freed from the malarial parasite and ordinary clinical symptoms disappeared. Neff points out that there is a necessity for a remedy which will destroy strains of malarial organisms that are "quinine fast," i.e. resistant to the drug; and in spite of the fact that it is relatively difficult to administer and the dose very often needs to be repeated, salvarsan brings about a rapid cessation of symptoms, sterilization of the blood, and a marked gain in weight and health.

In India a new drug, quinoidin, is being used in large quantities in the treatment of malaria. It is said to be effective, cheap, and an excellent prophylactic. It is valuable both in acute and chronic cases and should be given only after a

thorough purgation. The average dose is four grains twice a day. According to E. E. Waters (Communication to the *Indian Gazette*, Calcutta, September, 1916), quininoidin, properly administered, is at least as effective as quinine and causes no cinchonism or gastric disturbances.

**MALAY STATES.** See FEDERATED MALAY STATES; JOHORE; TRENGGANU.

**MALET, LUCAS.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, English.

**MALTA.** A British crown colony, composed of the Island of Malta (91.5 square miles) in the Mediterranean Sea with the islands of Goza (25.8 square miles), Comino (1 square mile), and Filfa and Cominotto (mere islets). Total civil population (estimate March 31, 1915), 218,542. Valletta, the capital, had, April 2, 1911, 44,143 inhabitants, including suburbs (Floriana, Sliema, and St. Julien's); the Three Cities (Senglea, Cospicua, and Vittoriosa), 26,551; Città Vecchia (the old capital), 8896; Victoria (formerly Rabat), 5655. Valletta is a coaling station and the centre of a large transit trade. The Maltese are remarkably thrifty and industrious; they are good seamen and excellent mechanics. There are 7.75 miles of railway. Imports and exports (1914-15), £2,790,310 and £687,849 respectively. Total weight of goods transhipped (1914-15), 4469 tons. Revenue (1914-15), £410,725; expenditure, £386,283. Tonnage entered and cleared, 7,705,015 (British, 4,714,011).

**MAMMALS.** See ZOOLOGY, *Mammals*.

**MAN, PREHISTORIC.** See GEOLOGY.

**MANCHURIA.** A dependency of China. It is situated east of Mongolia and the Province of Chili, and extends northward from the Yellow Sea and Korea to the Amur River, which separates it from Siberia. The area is estimated at 362,483 square miles. Estimates of population vary widely. The figure derived from the 1910 enumeration of households is 12,742,360, but this does not include children under six years of age; the number of such children has been estimated at about 362,000, so that the total population in 1910 may be placed at about 13,104,000. Manchuria consists of three provinces: at the north, Heilungkiang, with an estimated area of 202,703 square miles and an estimated 1910 population of 1,607,000; Kirin, 105,019 square miles, 5,501,000 inhabitants; Shengking, at the south, 54,761 square miles, 5,996,000 inhabitants. The city of Mukden is the administrative headquarters of Manchuria and also the capital of the Province of Shengking; its population is estimated at about 158,000. The city of Kirin is the capital of Kirin province; its population has been estimated as high as 100,000. Tsitsihar, capital of Heilungkiang, has perhaps 60,000 inhabitants.

Other important cities are: Antung, with an estimated population of 160,000, though this figure may be far too large; Kwangchengtze (Changchun), 80,000; Harbin, 68,000; Newchwang (Yingtze), at the mouth of the Liao River, 75,000; Newchwang City, 30 miles up the Liao, 50,000; Liaoyang, 40,000; Tiehling, 28,500; Fengwangcheng, 25,000; Sinminfu, 20,000; Fakumen, 19,500; Taonanfu, a town that has recently risen to importance, near the Mongolian border. Urban populations are little better than conjectural, and the fig-

ures here given must be regarded as only rough approximations. The Manchu population has practically disappeared, and the country has been colonized from the northern provinces of China proper. The immigration still continues, fostered by improved railroad facilities and the remarkable success of the soy bean industry.

Manchuria has one of the richest soils in the world, and it has grown more rapidly in wealth than any other part of the Chinese dominions. Important products, besides the soy bean, are millet, Kafir corn, wheat, rice, and tobacco. The net imports and the exports in 1914 were valued at 73,988,133 and 88,391,789 haikwan taels respectively (including the trade of the Japanese leasehold of Kwantung, q.v.). Both Russian and Japanese influence is exerted to develop the industrial and commercial interests of the country. The reported length of railway, which connects with the Chinese and Korean systems and includes part of the Trans-Siberian line, is about 2200 miles.

**MAN IN AMERICA, EARLY REMAINS OF.** See GEOLOGY.

**MANITOBA.** One of the Northwest Provinces of the Dominion of Canada, situated east of Saskatchewan and west of Ontario and Hudson Bay. The capital is Winnipeg. Area, 251,832 square miles, of which 19,906 water. This area includes that portion of the Northwest Territories annexed to Manitoba in 1912. Previously the area of the province was 73,732 square miles; between 1901 and 1911, the population of this area increased 78.52 per cent, or from 255,211 to 455,614. In 1911 Winnipeg had 136,035 inhabitants, being the third city in size in Canada; Brandon, 13,839; St. Boniface, 7483. Of the population 10 years of age and over in 1911, males numbered 192,815 (56.33 per cent) and females 149,498 (43.67); of these, 155,900 males and 22,206 females were reported as employed in gainful occupations. Of the males employed, 44.3 per cent were in agriculture, and of the females 44.9 per cent in domestic and personal service.

The provincial government is administered by a lieutenant-governor, appointed by the Governor-General of the Dominion; he acts through a responsible ministry of seven members. The Legislative Assembly is unicameral and consists of 49 members elected for five years. In the 12th Parliament, which convened in 1911, Manitoba was represented by four senators and 10 members of the House of Commons; the representation in the Commons on the basis of the 1911 census is 15. The Lieutenant-Governor in 1916 was Sir Douglas Colin Cameron, appointed Aug. 1, 1911, in succession to Sir D. H. McMillan.

**MANNING, RICHARD I.** Re-elected Democratic Governor of South Carolina Nov. 7, 1916. See SOUTH CAROLINA.

**MARKHAM, SIR ARTHUR BASIL.** A British member of Parliament, died in London Aug. 5, 1916. He was born in 1866 at Tapton House, Derbyshire, and after gaining an education at Rugby became a newspaper correspondent and coal-mine owner. While correspondent of the *London Times*, at the time of massacres in Macedonia and Armenia, he was captured by the Kurds and the British government had to use extreme measures to procure his release. From 1900 he had held a seat in the House of Commons as member for the Mansfield division of Nottinghamshire. In 1911 he was made a baronet. Sir Arthur, who identified himself with the so-called "Ginger Group" in the House, became one of its most prominent members. Since the beginning of the European war he had attacked the methods of the war department.

**MARKHAM, SIR CLEMENTS ROBERT.** A British geographer, traveler, and author, died in London Jan. 30, 1916. The son of a clergyman and grandson of an Archbishop of York, he was born at Stillingfleet, Yorkshire, in 1830. After studying at Westminster School, he entered the navy, in 1844, and was a lieutenant when he retired in 1852. During his service he had been with the Franklin Search Expedition, his experiences of which he published as *Franklin's Footsteps* (1852). Later he traveled in Peru, where he investigated the remains of the Incas, and in India, where he supervised the introduction, from South America, of the quinine-yielding cinchona plants. By 1862 he had written two more volumes. For 10 years (1867-77) Markham had charge of the geographical department of the India Office. Of the Royal Geographical Society he was honorary secretary (1863-88), founder's medalist, president (1893-1905), and then vice-president to 1912, and he was largely responsible for the fitting out of Sir George Nares's Arctic Expedition (1874) and of the British National Antarctic Expedition (1910-12): Captain Robert F. Scott was his personal choice for commander of the latter. Markham, who was created K.C.B. in 1896, held the presidency of the International Geographical Congress from 1894 to 1899, and received the degree of D.Sc. from Cambridge and Leeds. Among many works, and besides that mentioned he wrote: *Threshold of the Unknown Regions* (1874), a summary of the history of Arctic exploration; *Memoir of Archbishop Markham* (1906); *Richard III* (1907); *King Edward VI* (1908); *The Incas of Peru* (1910).

**MARK TWAIN.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, American.

**MARRIAGE RATE.** See VITAL STATISTICS.

**MARQUIS, DON.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, American.

**MARRIAGE AND DIVORCE.** Probably no social institution of fundamental importance has received as much discussion involving revolutionary proposals during the past few years as has the family. Even before the war the feminist movement, involving as it did greater

economic independence for women and practically changed political and social relations, had been accompanied by proposals for radical changes and wide-spread discussion of marriage and divorce. The European war greatly accentuated radical tendencies; whereas in belligerent countries the proportion of women of marriageable ages already previous to the war exceeded the number of men of similar ages, the balance of the sexes was violently disturbed by the killing and permanent injury of millions of adult males. Moreover, the progress of the eugenics movement, the spread of knowledge of birth control, and the opinion of many statesmen and publicists that the declining birth rate might involve the ultimate destruction of Western nations had prepared the public mind for a frank discussion of various proposals for regulating marriage and reproduction. In addition war itself inevitably disturbed the established rules of sex relation. From England, France, and Germany alike came proposals that all births whether legitimate or illegitimate should be treated on a plane of exact equality both in law and in public sentiment. The condition prevailing during and after the Thirty Years' War, when polygamy was socially sanctioned, was frequently cited with approval. It was widely insisted that the community should take effective measures to control prospective motherhood and fatherhood for racial and national advantage. In England opinion was sharply divided between those who held that women should voluntarily undertake unrestrained child bearing in order to replenish the depleted ranks of the population and those who contended that the preservation of the improved economic independence and social status of women requires that marriage be undertaken cautiously and child bearing be reasonably restrained. The latter opinion also emphasized the great economic stress which would continue long after the war ended as a condition unfavorable to marriage and large families. A much discussed proposition in England was that the surplus of single men in the colonies should be utilized to supply husbands for the widows and single women of England. In France it was generally believed that the war would put an end to the commercial and dowry marriage and would supply a much needed stimulation to the birth rate.

**NEW YORK.** A "Marriage Bureau Bill" was passed by the last Assembly of New York State. The aim of the bill was to put an end to the so-called "Marriage Trust" or aldermanic monopoly of New York City. It provided that the city clerk designate deputies in each borough to perform all civil marriage ceremonies. The ceremonies are to be held in the room in the municipal building which is to be set aside for this purpose and a fee of \$2 may be charged. This bill deprives the aldermen of the right to perform marriage ceremonies.

With reference to marriage ceremonies Jewish rabbis were warned by the District Attorney of New York against violating the laws of the State by marrying couples who had not obtained a license in that State. Most of these breaches of law had been committed through ignorance, and the rabbis were urged to carry out the law at all marriage ceremonies.

On April 14th the Newton or Marriage Annulment Bill was made a law in New York State. It provided that the marriage of per-

sons living in New York performed in another State may be annulled in New York in case the bride was of the age under which the consent of parent or guardian was required in the State where the ceremony was held.

**MARRIAGE VOWS AND THE CHURCH.** In eliminating the words "With all my worldly goods I thee endow" from the wedding ritual the Methodist General Conference in session at Saratoga Springs, N. Y., in May made a step toward equalizing marital relations. The responses of the bride and bridegroom in the marriage services of that church are now the same. Also in the General Conference of the Protestant Episcopal Church which met in St. Louis, October 11th-26th, the joint commission on legislation on matters relating to holy matrimony recommended in a minority report radical changes in the marriage ceremony. It was proposed to make the responses the same for both man and woman, and to eliminate the man's declaration of endowing the woman with all his worldly goods. These proposed changes were referred to the commission on the prayer book, and will be considered again in the general convention of 1919. The joint commission also recommended a church law which would make it impossible for a person divorced for any cause arising after marriage to be married again by an Episcopal clergyman. This proposed change was rejected, but the discussions incident to its presentation and the vote showed the lay delegation for the Southern dioceses unanimous for the existing regulation, that for the Eastern dioceses divided, while the delegations for Northern and Western dioceses were almost unanimously in favor of the new canon. The vote of the conference as a whole, voting by dioceses, recorded the clerical delegates as 40½ affirmative to 23¾ negative, and the lay delegates 29 affirmative to 32¾ negatives.

**Bibliography.** The following books were published in 1916: J. M. Donovan, *Law of Marriage, Annulment, Domicile, Divorce*; a series of three pamphlets, issued by Longmans, Green & Company on *Marriage: a Harmony of Body and Soul* by G. Bailey, on *Successful and Unsuccessful Marriages* by L. Creighton, and on *Marriage as a Career* by H. E. Crossman; Walter M. Gallichan, *The Great Unmarried*; B. G. Jefferis and J. L. Nichols, *Searchlights on Health*; H. C. Johnson, *Courtship, Marriage, and Rearing Young*; C. D. Larson, *My Ideal of Marriage*; C. E. Young, *Marriage Question in the Modern French Drama*. The Division of Bibliography of the Library of Congress issued a bibliography on divorce in 1915.

**MARSHAL OF FRANCE.** See FRANCE, *History*.

**MARTIN, SIR GEORGE CLEMENT.** An English organist and composer, died in London Feb. 23, 1916. He was born in 1844. For some years he was associated with the composer Stainer, first as pupil, later as master of the choristers and deputy organist at St. Paul's Cathedral, Stainer being organist. In 1888, on Stainer's resignation, Martin, who had already been made a doctor of music by the Archbishop of Canterbury, was appointed

his successor. He became especially noted as a trainer of choir boys, and wrote a standard manual on this subject. As a composer, he followed closely the style of Stainer. Best known of his compositions is the *Te Deum*, which was sung on the steps of St. Paul's at the time of Queen Victoria's diamond jubilee in 1897. Shortly after this event Martin was knighted.

**MARTIN, GEORGE MADDEN.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, American.

**MARTIN, SIR RICHARD BIDDULPH.** An English banker, died in Tewkesbury Aug. 23, 1916. Born in London in 1838, he was educated at Harrow and at Exeter College, Oxford. He gained a prominent place in the financial world, as chairman of Martin's Bank, Ltd., and of the Assets Realization Company, the Debenture Corporation, and the Anglo-American Debenture Corporation. For a time, also, he was at the head of the British North Borneo Company. With the exception of seven years, he served in Parliament from 1880 to 1905, in the year of his retirement being made baronet. He held the presidency of the Institute of Bankers and in 1906 of the Royal Statistical Society. His interest in other fields brought him election as fellow of the Anthropological Institute and the Royal Geographical Society, and office in many philanthropic organizations.

**MARTIN, WILLIAM MELVILLE.** A Canadian statesman, appointed premier of Saskatchewan, Oct. 19, 1916. He had been a member of the Canadian Parliament since 1908 and had become prominent as a supporter of Sir Wilfrid Laurier, the Liberal premier. In addition to the premiership, he assumed the portfolio of education. When appointed he was only 39 years old.

**MARTINIQUE.** An island of the Lesser Antilles; a French colony. Area, 987 square kilometers (381 square miles). Population (1911), 184,084. The capital is Fort-de-France, with about 27,000 inhabitants. The imports in 1914 were valued at £853,899 and the exports at £1,149,116. Vessels entered 472, of 459,052 tons. The 1913 budget balanced at 5,413,345 francs, and the debt amounted, Jan. 1, 1914, to 6,404,256 francs.

**MARYLAND. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 1,368,240. The population in 1910 was 1,295,346.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1916	700,000	27,800,000	\$24,297,000
	1915	710,000	24,850,000	15,158,000
Wheat	1916	640,000	10,240,000	17,510,000
	1915	638,000	10,272,000	10,786,000
Oats	1916	48,000	1,857,000	828,000
	1915	45,000	1,530,000	750,000
Potatoes	1916	43,000	4,085,000	5,433,000
	1915	44,000	4,268,000	2,646,000
Hay	1916	465,000	688,000	9,632,000
	1915	390,000	a 468,000	7,582,000
Tobacco	1916	25,500	19,835,000	3,142,000
	1915	22,000	b 16,280,000	1,384,000
Sw't potatoes	1916	9,000	1,134,000	998,000
	1915	8,000	1,040,000	728,000
Rye	1916	23,000	356,000	392,000
	1915	24,000	396,000	348,000
Barley	1916	6,000	192,000	140,000
	1915	5,000	170,000	119,000

a Tons. b Pounds.

See also AGRICULTURAL LEGISLATION.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . . .	4,837	4,797
Average number of wage earners . . . . .	107,921	111,585
Capital invested . . . . .	\$251,227,000	\$293,211,000
Wages . . . . .	45,486,000	53,792,000
The value of materials used. . . . .	199,049,000	288,972,000
The value of products . . . . .	315,669,000	377,749,000

**MINERAL PRODUCTION.** Estimates for the coal production of the State in 1916 indicated a decrease from 4,180,000 tons to 3,700,000 tons, a loss of 11 per cent.

The coal output of the State in 1915 was 4,180,177 short tons, valued at \$5,330,845, compared with 4,133,547 short tons, valued at \$5,234,796 in 1914. The chief increase occurred in Garrett County. The number of men employed increased from 5403 in 1914 to 5664 in 1915.

**TRANSPORTATION.** The total railway mileage on June 30, 1914, the latest date for which statistics are available, was 1401 miles of single track. The Baltimore and Ohio with 336 miles, has the longest mileage in the State, the Philadelphia, Baltimore, and Washington has 329, the Western Maryland 272, and the Baltimore, Chesapeake, and Atlantic, 88. There has been practically no construction since this date.

**EDUCATION.** The total school population of the State in the year 1914-15 was 415,908. The total enrollment in the public schools in 1915-16 was 146,530. This includes the enrollment of county schools only. The number of teachers in county schools in 1915-16 was 4501. The average yearly salary of teachers in county schools was \$399.76. See also EDUCATION IN THE UNITED STATES.

**FINANCE.** The total receipts for the fiscal year 1914, which is the latest date available, were \$12,006,566. The disbursements amounted to \$12,999,561, leaving a balance on Sept. 30, 1914, of \$1,840,256. The bonded debt of the State in 1914 amounted to \$19,685,880.

**CHARITIES AND CORRECTIONS.** The board of State aid and charities has general control of the charitable institutions of the State. Most of the penal institutions, such as the city and county jails and the penitentiary, do not come under supervision of this board. It has general charge of a large number of homes and asylums for adults and children, and also has supervision over the general hospitals and insane hospitals. State aid is also given to a number of reformatories for children, some of which are under religious auspices and others sectarian. The Legislature of 1916 made some changes in the method of appropriations for the support of these institutions. In future appropriations, will be made on the per capita system, and not as heretofore in a lump sum. There are in the State 23 general hospitals, 7 hospitals for the insane, and 9 special hospitals. Convicts of the State are generally employed under contract, the majority being engaged in the manufacture of boots and shoes.

**POLITICS AND GOVERNMENT.** The campaign in Maryland in 1916 resulted in a decisive personal victory for President Wilson. He received the

largest plurality cast for a Democratic candidate in more than a generation, with the exception of 1912. The personal character of the President's victory was demonstrated by the facts first that a bitter factional fight between the Democratic State organization and the party organization for Baltimore city, which embraces approximately half the population of the State, led to a refusal on the part of the latter to cooperate with the former in the conduct of the campaign, resulting in duplication of work, friction, distraction of party workers, and marked inefficiency; that a very considerable number of prominent professional and business men affiliated with the Democratic party declared themselves for Mr. Hughes, and attempted to organize the Democrats on the latter's behalf; that the Republican management of the campaign was conducted in an unusually vigorous manner, and was better financed than in many years.

Although President Wilson carried the State, Congressman David G. Lewis, Democratic nominee for Senator, was defeated by Dr. Joseph I. France, Republican. Mr. Lewis was defeated by adverse pluralities in Baltimore city and Baltimore County. He carried the other sections by very substantial pluralities. His defeat was due to open opposition from the Democratic organization in Baltimore city, which held him to be the candidate for the State organization with which it was at odds; opposition from the organized liquor forces; and probably to opposition from certain public utilities which were antagonistic to him because of his support of government ownership of telegraph and telephone lines, and his alleged support of the government ownership propaganda in general.

The Democrats elected four of the six Representatives, while in the previous election they elected five. The district lost was the sixth, which is normally Republican, and which Mr. Lewis had carried three consecutive times.

The vote for President was: Wilson 138,359, Hughes 117,347, Hanly 2903, Benson 2674, and Reimer (Labor) 756.

An amendment to the State constitution providing an executive budget system for handling business finances was adopted by a vote of 77,408 to 36,100. Students of the subject hold that this budget system is the most scientific in construction, and the most radical in governmental changes effected to be found in the United States. Statutory prohibition was voted on in the sections of the State, that were under license. Each subdivision voted as a unit. Seven of the 11 units voted against prohibition. Baltimore city vote was 29,921 for, and 75,137 against.

**LEGISLATION.** The Legislature met in 1916 and passed many important measures. A record of these follow:

Provision was made for the creation of a juvenile court in any county where all the judges in the circuit deem it necessary. The court has jurisdiction over dependents, neglected, and delinquent male children under 20, and females under 18. Permission was given to juries to add to first degree murder verdicts the words "without capital punishment," in which case the court shall impose a life sentence and not a death penalty. An agricultural system to develop the agricultural resources of the State was incorporated. The purity and sale

of seeds was regulated. The conservation commission to control fish, game, and fur-bearing animal resources was created. A State board of motion pictures censors was also created. The laws relating to the practice of medicine were amended. There was created a State board of labor and statistics to take the place of existing agencies for the administration of all labor laws except the workmen's compensation act. Many other changes were made in laws regulating employment. A State labor board was authorized to investigate the extent and causes of unemployment and remedies therefor.

**STATE OFFICERS.** Governor, Emerson C. Harrington; Secretary of State, Thomas W. Simmons; Auditor, J. Enos Ray; Comptroller, Hugh A. McMullen; Treasurer, John M. Dennis; Adjutant-General, Henry W. Warfield; Attorney-General, Albert C. Ritchie; Superintendent of Education, M. B. Stephens; Commissioner of Insurance, W. Mason Shehan—all Democrats.

**JUDICIARY.** Court of Appeals: Chief Judge, A. Hunter Boyd; Associate Judges, N. Charles Burke, William H. Thomas, John R. Pattison, Hammond Urner, John P. Briscoe, Henry Stockbridge, and Albert Constable; Clerk, Caleb C. Magruder.

**STATE LEGISLATURE.** No session in 1917.  
**MARYLAND, UNIVERSITY OF.** A non-sectarian co-educational institution at Annapolis and Baltimore, Md. It was founded in 1784. In the fall of 1916 there were 1400 students and 211 faculty members. The university has productive funds amounting to \$150,000, and in 1916 from all sources it drew an income of \$200,000. There are 25,000 volumes in the library. Provost, Thomas Fell.

**MASEFIELD, JOHN.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction, Poetry, History, etc.*, English.

**MASON, FRANK HOLCOMB.** An American consular officer, died in Paris June 21, 1916. He was born at Niles, Ohio, in 1840, and studied at Hiram College, but did not graduate. In the Civil War he was promoted from private to captain for his services at Vicksburg; for a time he was a prisoner in Libby Prison. After the war he entered newspaper work, first as a reporter for the *Cleveland Leader*, and later as editorial writer and managing editor till 1880. In that year he received an appointment as United States consul at Basle, Switzerland, where through his efforts a stop was put to the undervaluation of silks and aniline dyes shipped to this country. After four years he was transferred to Marseilles, where he remained till 1889. It was while at this post that he made a record for his services in connection with an epidemic of cholera. He prepared a series of valuable reports on the subject of this disease and its treatment, published in collected form by the United States government. For a decade (1889-99) Mr. Mason was consul-general at Frankfort-on-the-Main, Germany. In that country he did much to expand the market for American goods, especially during six years as consul-general at Berlin. From 1905 to his retirement in 1913, he held a like office in Paris. Continuing to reside in the French capital, he had recently been chairman of the American Ambulance Hospital there.

**MASPERO, GASTON CAMILLE CHARLES.** A French Egyptologist, died in Paris June 30, 1916. Born in the French capital June 24,

1846, he studied the Egyptian language privately as a youth and at 19 was adept in interpreting hieroglyphic inscriptions. After further studies at the Ecole Normale, and researches into the Indian dialects of Peru, made at Montevideo, he became connected with the department of Egyptology at the Ecole des Hautes-Etudes, three years later receiving his doctorate. In 1874 he accepted a chair in the Collège de France, in 1880 was sent to Egypt by the government at the head of the Mission Archéologique, and the next year was appointed director of the excavations and antiquities of Egypt. After five years he returned to Paris, where he again took his chair in the Collège and became director of Egyptological studies at the Ecole des Hautes-Etudes. From 1899 to 1914, when he was elected life secretary of the Académie des Inscriptions et Belles-Lettres, he occupied for the second time his post in Egypt. His first great work as a scholarly writer was done in his *L'Histoire ancienne des peuples de l'Orient*, published in 1875. A pioneer treatise in its wide scope, it was frequently revised and published in new editions. Other works, as translated into English, are: *Manual of Egyptian Archaeology; The Dawn of Civilization; Egypt and Chaldea; The Struggle of the Nations: Egypt, Syria, and Assyria; The Passing of the Empires; A Complete History of Egypt* (12 vols.); *New Light on Ancient Egypt*; and *Art in Egypt*. In French his writings are very numerous. Foreign recognition came to Maspero when the King of England conferred on him the K.C.M.G. in 1909.

**MASSACHUSETTS. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 3,747,564. The population in 1910 was 3,366,416.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1916	42,000	1,764,000	\$2,117,000
	1915	48,000	2,804,000	1,848,000
Oats	1916	15,000	480,000	317,000
	1915	12,000	432,000	220,000
Potatoes	1916	25,000	2,275,000	3,981,000
	1915	26,000	3,120,000	2,933,000
Hay	1916	480,000	a 749,000	14,231,000
	1915	470,000	705,000	15,510,000
Tobacco	1916	7,800	b 12,118,000	3,080,000
	1915	8,800	9,680,000	1,404,000
Rye	1916	3,000	56,000	71,000
	1915	3,000	60,000	61,000

a Tons. b Pounds.

See also AGRICULTURAL LEGISLATION.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments	11,684	12,013
Average number of wage earners	584,559	606,698
Capital invested	\$1,279,687,000	\$1,548,961,000
Wages	301,174,000	341,310,000
The value of materials used	830,765,000	981,384,000
The value of products	1,490,529,000	1,641,378,000

**TRANSPORTATION.** The total railway mileage including tracks of all kinds in 1916 was 5062.

This includes 2157 miles of main track, 1154 of second, third, and fourth tracks, and 1749 of side tracks. The increase in mileage during the year was 26.

**EDUCATION.** The school census was taken on Sept. 1, 1914. It showed children between 5 and 16 years of age to number 651,971. The total enrollment for the school year ending June 30, 1915, was 591,582. The average daily attendance was 506,910. The school year ended June 30, 1915. The number of teachers was 18,242. The statistics for the monthly or yearly salary of teachers are not available.

**FINANCE.** The total receipts from all sources for the fiscal year 1916 amounted to \$58,988,750, and the disbursements to \$59,449,601. The balance at the beginning of the year was \$11,924,400, and at the end of the year was \$11,463,549. The chief sources of revenue are the corporation tax, inheritance tax, and savings bank tax. The chief expenses are for departmental expenses, and payments for interest and serial bonds. The bonded debt of the State less sinking funds on Dec. 1, 1916, amounted to \$85,666,682.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include: the State Infirmary at Tewksbury, the State Farm at Bridgewater, the Norfolk State Hospital, the Lyman School for Boys at Westborough, the Industrial School for Boys at Shirley, the State Industrial School for Girls at Lancaster, the Massachusetts Hospital School at Canton, the North Reading State Sanatorium, the Rutland State Sanatorium, the Lakeville State Sanatorium, and the Westfield State Sanatorium. The inmates receiving care number about 20,000 each year, and the cost of maintenance is about \$1,500,000. The prisons, which include the State Prison in Boston, the Massachusetts Reformatory at Concord, Reformatory for Women at Sherborn, Prison Camp and Hospital at Rutland, State Farm at Bridgewater, are under the control of a Board of Prison Commissioners.

**POLITICS AND GOVERNMENT.** The Legislature met in 1916 and passed a number of important measures. These will be found recorded in the paragraph *Legislation* below. On April 25th the Republicans elected uncompromised delegates to the national convention. There were elections for Governor and other State officers, and United States Senator. Senator Lodge was a candidate for reelection, and was renominated by the Republicans. Governor McCall was also renominated. In the election of November 7th, Governor McCall received 276,123 votes, compared with 229,883 for Mansfield, his Democratic opponent. Senator Lodge received 267,157 votes, compared with 234,199 for Fitzgerald, his Democratic opponent. For President, Hughes received 278,265 votes, compared with 247,845 for Wilson. The Socialist candidate, Benson, received 11,058 votes. For United States Senator, McDonald, Socialist candidate, received 15,558 votes.

**LEGISLATION.** The Legislature met in 1916, and passed a number of important amendments. Record of these follow:

The civil and criminal jurisdiction of district or municipal courts was so extended that their process runs throughout the State, and makes them courts of superior and general jurisdiction. The board of prison commissioners and the boards of parole were abolished, and a bureau of prisons under a director, and with an ad-

visory board of three men and two women, and a board of parole of three members were created. The economic and efficiency system was abolished, and a supervisor of administration was substituted. The increase in salaries of State employees without the approval of the government in council was forbidden. The laws relating to primary ballots were amended in important particulars. The question of calling a constitutional convention was submitted to the general election of 1916. Authorization was given to cities to establish by referendum day or night schools in agriculture and horticulture, under the supervision of the State Board of Education. A commission was created to investigate physical training for boys and girls in public schools, especially with a view to military training. A reserve list of officers of the military and naval militia was created. Other laws relating to the militia were passed. An income tax was enacted. Incomes from investments except from savings bank deposits, or bonds of the United States, or of the State are taxed 6 per cent. Incomes from trade, professions, and business are taxed 1½ per cent on the excess over \$2000. Laws for the prevention of forest fires were enacted. A social insurance commission to study the effects of sickness, unemployment, and old age was created, and also a commission to investigate the uses of habit-forming drugs, and the effectiveness of preventive laws. Laws relating to insurance were amended.

The Legislature enacted so many amendments to the State constitution that that body decided to submit none of them to the people, but to refer instead a proposition for a constitutional convention. Prominent among the problems which it was hoped such a convention might work out were those relating to taxation and assessment. The last constitutional convention held in the State was in 1853.

A new law intending to prevent misstatements in advertising went into effect on May 25th. This law prohibits unlawful statements of valuation in excess of advertising prices, false declarations, misstatements regarding securities offered for sale, misleading statements designed to induce the public to patronize the advertiser, and other intentional deceptive advertising.

**STATE OFFICERS.** Governor, Samuel W. McCall, Rep.; Lieutenant-Governor, Calvin Coolidge, Rep.; Secretary of State, Albert P. Langtry, Rep.; Treasurer, Charles L. Burrill, Rep.; Auditor, Alonzo B. Cook, Rep.; Adjutant-General, Gardner W. Pearson, Dem.; Attorney-General, Henry C. Attwill, Rep.; Secretary of the Board of Agriculture, Wilfrid Wheeler; Commissioner of Insurance, Frank H. Hardison; Commissioner of Education, Payson Smith.

**JUDICIARY.** Supreme Judicial Court for the Commonwealth: Chief Justice, Arthur Prentice Rugg; Justices, Edward P. Pierce, William C. Loring, Henry K. Braley, James B. Carroll, Charles A. De Courcy, John C. Crosby.

**STATE LEGISLATURE.**

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Republicans .....	84	170	204
Democrats .....	6	68	74
Socialists .....	..	1	1
Independent .....	..	1	1
Republican majority..	28	100	128

NEW BUILDINGS OF THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY, CAMBRIDGE, FROM ACROSS THE CHARLES RIVER  
William Welles Bosworth, Architect

**MASSACHUSETTS INSTITUTE OF TECHNOLOGY.** A non-sectarian technical institution in Cambridge, Mass. It was founded in 1861. In the fall of 1916 there was a total enrollment of 1957 and there were 130 faculty members. During the year C. Frank Allen, professor of civil engineering, retired. An officer of the engineering corps of the United States army was detailed to assist the professor of military science. Four new instructors, resident at certain companies where students in chemical engineering practice study, were added to the faculty. To establish a school of chemical engineering practice, \$300,000 was received. Total gifts amounting to about \$5,800,000 were received during the year. A large part of this was secured as endowment, more than half being given by an unnamed donor. A notable event in the history of the institution was the transfer of its plant from Boston to a group of magnificent new buildings in Cambridge, the dedication of which in June was made the occasion of an elaborate celebration. The new buildings have about 18,000 rooms. (See ARCHITECTURE, *Educational Buildings*.) The productive funds of the institute amount to \$4,800,000 and the income for 1916 was \$200,000. The library contains 135,000 volumes. President, Richard Cockburn Maclaurin.

**MASTERS, EDGAR LEE.** See LITERATURE, ENGLISH AND AMERICAN, *Poetry*, AMERICAN.

**MATTER, CONDITIONS OF.** See CHEMISTRY, GENERAL.

**MAURIN, LOUIS JOSEPH, CARDINAL.** See ROMAN CATHOLIC CHURCH.

**MAURITANIA.** A civil territory of the government-general of French West Africa (q.v. for area, population, etc.). Considered from the ethnical point of view as the country inhabited by the descendants of the mixed Arab and Berber races known under the name of Moors, Mauritania is that region included within the south and west frontiers of the Sahara, the Atlantic coast, and the Senegal and the Niger rivers. A part of the population is of the same race as those to be found in Senegal—Oulofs, Peuhls, Toucouleurs, etc.; but the majority are Moors, invariably of Islam strongly tinged with Sufism. With the exception of palm-tending groups, they are nomads, exclusively occupied in grazing. The negroes gather forest products, cultivate grains, etc., and catch and dry fish. Little information concerning the commerce of the country is available; in the oases the primitive method of barter obtains. Travel is by caravans. The chief towns are: Port-Etienne, Boutilimit, Aleg, Selibaby, etc.

**MAURITIUS.** A British crown colony; an island in the Indian Ocean. Area 720 square miles. At the 1911 census, the total population was 368,510. The natives of European race are in large part French creoles. Port Louis, the capital, had (1911) with suburbs, 50,060 inhabitants; Curepipe, 17,173; Mahébourg, 4068. The cultivation of sugar-cane is the staple industry. Total imports and exports (1914), including shipping charges on home products, \$7,959,939 rupees and 59,965,797 rupees respectively. Revenue 1913-14, 11,142,611 rupees; expenditure, 10,218,470 rupees; customs revenue, 4,202,476 rupees. Tonnage entered and cleared (1914), 874,969. External debt, June 30, 1914, \$1,279,990.

The inhabitants showed from the outbreak of

the war an active sympathy with France, and from the beginning of the war gifts of all kinds were contributed to the public cause. A Mauritian committee was founded in Paris and others were established on the island. Money and supplies were sent to the French authorities and it was estimated toward the close of 1916 that over 1,000,000 francs had been contributed by the island. Conscription was not in force there. Nevertheless, the inhabitants, including many who belonged to the leading families, joined the colors of France or England. Many lost their lives at the front. The rector of the Royal College pronounced a eulogy after reading a long list of students who had fallen on the field of battle.

**MAYOTTE AND THE COMORO ISLANDS.** A group of islands belonging to France, administered under the Government of Madagascar. Area, 2168 square kilometers (837 square miles); population, as estimated Jan. 1, 1914, 97,900. Imports and exports 1914, 2,296,575 and 2,874,019 francs respectively.

**MAXIM, SIR HIRAM STEVENS.** A British engineer and inventor, died in London, England, on Nov. 24, 1916. He was born in 1840 at Sangerville, Maine, U. S. A., where he received his early education. After being apprenticed to a coach builder, he worked in his uncle's engineering establishment at Fitchburg, Mass., later becoming foreman in an instrument factory. After this he was employed in the Novelty Iron Works and Shipbuilding Company in New York. In addition to his regular employment he had taken out patents for various improvements in steam engines and had put on the market an automatic gas machine. He invented the system of flashing which made incandescent lighting possible, and also perfected other electrical devices, some of which were exhibited at the Paris Exposition of 1881. In the latter year he went to England, where he proceeded to develop his automatic system of firearms, his most celebrated invention being the Maxim gun, a weapon loaded and fired by the energy of its own recoil. Besides more than 100 international patents relating to petroleum and other motors, his inventions included explosives and ordnance materials. Among the former was a smokeless powder. He had also become deeply interested in aerial navigation.

He bought an estate near Bexley, England, where he built laboratories and an experimental station and carried on elaborate experiments in aeronautics, constructing in 1894 a large-power flying machine. One of his latest devices was an apparatus for counteracting the effect of poisonous gases in the European war. This was first used in 1915 by the Allies. During the few months preceding his death he was working on a new type of aeroplane intended to be of great speed and relatively small fuel consumption. For many years he was a member of the British ordnance firm of Vickers' Sons and Maxim. Alleging unfair treatment of his inventions by the United States government he became a naturalized citizen of Great Britain, and was alienated from his brother, Hudson Maxim, who remained in the United States. The French government made him a Chevalier of the Legion of Honor. Queen Victoria knighted him in 1901. He was a member of many learned societies. He published

*Artificial and Natural Flight* (1908), and his autobiography, *My Life* (1915).

**MEARS, HELEN FARNSWORTH.** An American sculptor, died in New York City Feb. 17, 1916. She was born in Oshkosh, Wis., in 1878, and early gave evidence of talent as a sculptor. At 14 she won a prize at the World's Fair, Chicago, for the best symbolic figure of Wisconsin. Later, after attending the Wisconsin State Normal College, she studied at the Académie Julian in Paris, and under Augustus Saint-Gaudens, who held a high opinion of her work. Her statue of Frances E. Willard is in the Capitol at Washington, and her "Fountain of Life" was awarded a medal at the St. Louis Exposition in 1904. Miss Mears was known also for portrait reliefs of Alexander MacDowell and of Saint-Gaudens and for busts of George Rogers Clark and Dr. William L. G. Morton (Smithsonian Institution). She left uncompleted a fountain for one of the New York City parks.

**MEAT SUPPLY.** See STOCK RAISING AND MEAT PRODUCTION.

**MEDALS FOR CHEMICAL RESEARCH.** See CHEMISTRY, INDUSTRIAL.

**MEDICAL EDUCATION.** The annual presentation of educational data by the council on medical education of the American Medical Association shows, among other interesting facts, that there were 14,022 medical students in the United States for the year ending June 30, 1916. Of the total number 13,121 attended non-sectarian or regular colleges, 638 homeopathic institutions, and 263 eclectic colleges. The total number of graduates for the year was 3518, of which 3274 were from non-sectarian colleges, 166 from homeopathic colleges, and 78 from eclectic schools. The rising standard of preliminary education is shown in the high proportion of students holding degrees in arts or science. There were 566 women matriculants and 134 graduates.

**MEDICAL EXAMINERS, NATIONAL BOARD OF.** The National Board of Medical Examiners of the United States, founded in 1915, by Dr. W. L. Rodman, who died March 8, 1916, while president of the American Medical Association, has added some to its directorate, entirely of physicians, which includes Victor Vaughan, Surgeon-General Blue, Surgeon-General Gorgas, Austin Flint, and Herbert Harlan. Col. Louis A. La Garde is treasurer, and Surgeon-General Braisted is president, the office of the secretary, J. S. Rodman, being at 2106 Walnut Street, Philadelphia. The object of the Association is to establish a standard for examination and registration of physicians in the United States, to cooperate with boards of medical examiners in all the States, and in effect to raise the requirements for physicians in this country. The board has been endorsed by several bodies, including the American Medical Association, American Association of Military Surgeons, Clinical Congress of North America, and several Academies of Medicine.

**MEDICAL PROGRESS.** There has been notable activity in the study of infectious diseases and several new specific microorganisms have been identified. (See DIPHTHERIA, EPILEPSY, HEMORRHAGIC JAUNDICE, PARATYPHOID FEVER, POLIOMYELITIS, RABIES, RAT-BITE FEVER, ROCKY MOUNTAIN SPOTTED FEVER, TYPHOID FEVER, TYPHUS FEVER.) Our knowledge as to diseases due to hot climates has been advanced in many directions. (See LEP-

ROSY, MALARIA, TROPICAL DISEASES.) The ultimate causes of cancer have engaged the continuing attention of many investigators (see CANCER), and the diagnosis of tuberculosis has been made more exact. (See TUBERCULOSIS, TUBERCULIN.) The use of serums and vaccines in the cure and prevention of diseases was greater than ever before. (See SEROTHERAPY, VACCINE THERAPY.) The European war gave rise to many surgical problems which have been met and solved. (See DAKIN'S SOLUTION, SOLDIER'S HEART, SURGERY.) Several new drugs or medicinal preparations have been introduced, among which may be mentioned, CHLOBAZENE, DIMAZON, KEPHALIN, PETROGAR. The relation of oral hygiene to general and local injections of the body has received an extraordinary amount of attention. (See STOMATOLOGY.) Other medical items and statistics will be found under their respective captions.

**MENTAL TESTS.** See PSYCHOLOGY, section so entitled.

**MERCIE, ANTONIN.** A French sculptor and painter, died Dec. 15, 1916. He was born at Toulouse in 1845, studied under Jouffroy and Falguière, and in 1868 won the Prix de Rome. The merit of his "David Vainqueur" (1872) gained him admission to the Legion of Honor, and the fine patriotic group "Gloria Victis" (1874), now in the court of the Hotel de Ville, Paris, established his reputation. Other famous works are the high relief "The Genius of the Arts," for the so-called Guichet du Louvre; the group "Quand Meme" (1882) at Belfort (a replica is in the Gardens of the Tuileries); the statues of Meissonier (Louvre Gardens) and William Tell (Lausanne); the tombs of Cabanel and Michelet in the cemetery of Père-Lachaise and of Louis Philippe in Dreux Cathedral; the figure "Remembrance" in the Luxembourg; the monument to Gounod for the Parc Monceau; Lee, in Washington; and Francis Scott Key, in Baltimore. His best work combines technical skill, feeling, and a certain grandeur of conception, with rhythm, movement, and delicacy of sentiment. He was also successful as a painter in such canvases as "Venus" and "The Sleeping Nymph." In 1891 he was elected a member of the Académie des Beaux-Arts.

**MESOPOTAMIA.** See WAR OF THE NATIONS.  
**METALLURGY.** The chief function of the metallurgist in 1916 was to do his utmost to increase the output of metals from the various refineries and other plants in order to meet the vast demands provoked by the great war. At the same time in the neutral countries the general prosperity was in some part due to the demand for metals and the high values prevailing. Accordingly, the metallurgist was concerned mainly with direct problems of production, with the design and construction of new plants to work modern processes efficiently and on a large scale, and with the recovery of metal from low grade ores that once would not have been considered worth treating. Consequently little time or opportunity was left for independent research and investigation, and as a result there were few important discoveries or radical innovations in practice introduced, though much time was spent on testing and experiment in the case of new methods or processes which promised well. The development of the flotation method for treating various ores continued and much more was learned both as to its practice and advantages and as regards its theory. In electro-metallurgy there were developments rather in the direction of increased use and more intensive application in the United States and also in Europe, especially in Norway and Sweden where cheap water power and the high prices prevailing for metals led to increases in the capacity of plants. The more significant features of the metallurgical development of the year, based mainly on the authoritative annual reviews in the *Engineering and Mining Journal*, the *Iron Age*, and *Metallurgical and Chemical Engineering*, are summarized in the accompanying paragraphs.

**FLOTATION PROCESS.** The great success of the flotation process led to its extensive use, in fact by practically every large copper company, and produced considerable litigation under the various patents. On Dec. 11, 1916, what was up to that time the most important decision in the matter was handed down by the Supreme Court of the United States in the case of Minerals Separation, Ltd., and Minerals Separation American Syndicate, Ltd., vs. James M. Hyde. The court upheld the original patent in a number of important claims. The decision dealt with the amounts of oil used, specified as less than 1 per cent of the amount of ore, and in processes where greater amounts are used the patents of the Minerals Separation, Ltd., were decided not to be infringed. Inasmuch as some 25,000,000 tons of ore were beneficiated by this process in 1916 and only about one-half of this was worked under license of the patentees, a striking situation developed which would require a vast amount of adjustment and heavy payments by those infringing. The royalties that were being paid in 1916 varied from 12 cents for each short ton where the tonnage did not run over 4000 tons per day, on a sliding scale to 4 cents per ton when it amounted to or exceeded 30,000 tons daily. This Supreme Court decision seemed to dispose of the validity of the patents so far as their essentials were concerned, but at the end of the year there was another case, that of the Miami Copper Co. against the same owners of the patents, awaiting decision from the Supreme Court in which other elements were pres-

ent. The lower court had decided in favor of the Minerals Separation, Ltd.

Flotation was practiced extensively during the year with the copper and zinc ores, as at plants like Butte and Superior in the case of zinc ore handlers, and Anaconda, Inspiration, and the mills working porphyry copper bearing ores. It was believed that the same process could be used with the sulphide ores, especially the silver sulphides found in abundance in Mexico, Western United States, and elsewhere, and also with the ores of some of the rarer metals, such as molybdenum. Many varieties of oils were tried in the flotation process, and for the frothing agents vegetable oils were employed, while to place the oil film on the mineral particles cheaper mineral oils were often used. Oil derived from the sage brush was used with some success and some of the coarser grades of mineral oil.

**GOLD AND SILVER.** During 1916 most of the world's gold mines were being worked to the extreme physical limits to secure adequate supplies of the metal for national and other debts. This involved new construction rather than great advances or changes in actual ore treatment. The increased use of the flotation process continued, and in addition a number of plants originally equipped for cyanide treatment were altered for flotation with increased economy claimed in the recovery of the metals. Flotation was being applied more to ores on a precious basis, as well as in processes where base metals had been treated and the gold and silver recovered as a by-product. In particular interesting developments were looked for in the use of large flotation installations in mills treating silver sulphide ores principally. The increased use of flotation, however, required improvements in the grinding machinery to secure a finer product, and with the better types of tube and ball mills there was also used a so-called Marathon mill where the action was produced by the falling on one another of cylindrical steel rods. While most of the big mills were employing flotation either regularly or on an experimental basis, yet cyaniding processes continued to be used and were found in several new plants. The stamp mill in many mines was being replaced by the Hardinge conical mill, and the old amalgamation process was being considered generally of less usefulness, and while it had not altogether disappeared, finding application in California, Colorado, Canada, and South America, yet it had become considered largely to be an auxiliary process. During the year, however, the combination of cyanide and flotation processes was studied in connection with the metallurgy of gold and silver.

**COPPER.** Naturally the metallurgy of copper in 1916 was influenced by the economic position of this metal, especially its high value and its being in extraordinary demand for war and other purposes. Not only were existing plants worked to or in excess of capacity, but new reduction works were established, and lean ores once neglected were receiving careful metallurgical attention. In fact, the average content of metal in the ores treated was showing a constant decrease and by-products, such as sulphuric acid and minor metal such as nickel, selenium, and tellurium, were figuring to an increased extent. The three main features of metallurgical progress in copper refining in 1916

consisted in flotation, leaching, and the recovery of sulphuric acid from smelter smoke. This involved to a notable degree in the new plants special and original design and equipment, as distinct from the adaptation of older plants to the newer processes. In flotation fine grinding mills were required and special methods for drying and smelting the concentrates. The different classes of ores lent themselves to different methods of treatment, and increased work with the flotation process led to a better understanding of its advantages as well as its limitations. For sulphide ores that yielded over 82 per cent from concentrates under the old wet concentration methods, the flotation method advanced the yield to 96 per cent. With mixed sulphides and oxides a separate hydrometallurgical method seemed more advantageous, though chemical treatment could be added to the flotation method.

The first large all-leaching plant in the United States was almost completed at Ajo, Ariz., by the New Cornelia Copper Co., with a capacity of 5000 tons. This had 11 lead lined tanks 88 x 88 x 15 for leaching, and two 7500 kilowatt turbines supplied power.

For the treatment of fumes from copper smelters the Cottrell process of electrostatic precipitation was finding application in the larger plants, and at many works the value of by-products was being fully realized. Sulphuric acid was being produced at several works, at one of which it was proposed to begin the manufacture of fertilizer. At one smeltery by the bag house method, zinkiferous fumes were being collected and treated so as to produce electrolytic zinc. In Australia further attempts were being made to recover elemental sulphur.

**LEAD.** During the year there were in progress several investigations where the chemical reactions in smelting lead ores were being studied with the aim of securing increased precision in the various operations and utilizing the results of the research of the chemist. In the equipment of the various smelters there were improvements such as the introduction of the Newnam mechanical ore hearth, where a mechanical device for working the charge replaced the hand hearth. This made possible profitable smelting in the open hearth as distinguished from the blast-furnace. In the latter an innovation of the year was the so-called "double treatment," where the "fines" were screened after being roasted and were retreated. A new crude oil burner was introduced during the year in the Dwight and Lloyd sintering machines. The new blast furnaces of the year all showed improvement in being water-jacketed from the top of the crucible to the feed floors or even lower by a double tier of jackets.

The collection of flue dust and fumes was also attracting attention and improved and cheaper forms of bag house construction were provided, while Cottrell electric precipitators were being used at lead as at other plants.

**ZINC.** With the great demand for spelter in 1916 most smelters were occupied to capacity, and while they were troubled by inefficient labor and the high cost of fuel yet they maintained a high rate of production that was in excess of the record year of 1915. For this reason there was not much opportunity to try out new methods or for the technical staff to indulge in research. Economies in natural gas, the cost of

which was rapidly rising, as well as in coal, were in order and various types of producers were being tested experimentally with that object. The retreatment of furnace residues was receiving much attention and various methods were in vogue either to obtain the silver and lead for lead blast smelting furnace, or to recover the last part of their zinc in the form of zinc oxide fumes. Redistillation in the refining of spelter was practised at a number of plants, resulting in a product of high purity. In this redistillation several rare elements were encountered in the residue. Among the notable works of the year was the construction of a smelting works in Vado bei Savona, Sardinia, by the Societa di Montepeni, the largest zinc producers in the island, with six furnaces of 240 retorts each. A coking plant was to be provided and two electric furnaces installed.

Large scale refining by redistillation in electric furnaces was carried on in Sweden and Norway, especially at Sarpsborg and Trolhättan, and at the latter place electric ore smelting was also done. In the United States a notable work was the completion and operation of the Great Falls refinery of the Anaconda Company producing electrolytic spelter. In addition electrolytic spelter was produced by the Consolidated Mining and Smelting Company of Trail, B. C., Canada. The hydrometallurgical-electrometallurgical process (see YEAR BOOK for 1915) was attracting considerable attention and a number of plants were under construction, in addition to a few smaller ones that were operating during the year. In Australia the Electrolytic Zinc Company was organized to erect a plant in Tasmania and treat ore from Broken Hill, New South Wales.

**IRON AND STEEL.** With the call for increased output from furnaces and mills in 1916 metallurgical advances were not of a striking nature when considered technically, though in some cases there was a note of progress in the ordinary developments. A few of the more important discoveries will be found discussed in the section on *Iron and Steel* in the article **CHEMISTRY, INDUSTRIAL**. Every American metallurgical plant was operating to capacity or beyond, and better organization and greater efficiency often was noted. The coke from the by-product oven was used increasingly as the war demand for benzol and toluol from the gases made such installations profitable, and the superiority of such coke over the bee-hive oven product had been appreciated by iron and steel metallurgists, even when the supply was limited. Another fuel development of the year was the use of powdered coal in open hearth and heating furnaces of steel plants. In the open hearth the coal is blown by an air jet of considerable pressure into the outer end of the port and is surrounded by a jet of compressed air which carries it into the current of heated air rising through the regenerator. There is a direct combustion of carbon particles, which afford a large amount of radiant heat. The method was said to be economical in that it cost less to powder coal than to gasify it in a producer and that the pulverized fuel contained the entire energy of the coal as compared with 80 per cent in the gas.

An important work of the metallurgists was the study of useful high-grade ores derived by concentrating unusable rocks. This tending

towards concentration and ore treatment of materials before putting them through the blast furnace was one that seemed to promise considerable importance for the iron industry as in the case of the more valuable metals.

In connection with blast furnaces it was interesting to note that by the use of more efficient boilers and turbines for power, the supremacy of the gas engine was being questioned for power purposes.

The duplex process where the pig iron is first treated in an acid Bessemer converter and then in a basic open hearth furnace made continued gains during 1916, and it was stated that the larger works in the future would produce most of their steel by duplex working. The severe requirements of the war specifications were responsible for attempts to improve the casting of steel ingots and reduce the losses from piping, segregation, etc., which in some plants were said to have cut down the merchantable product to 50 per cent or less. This matter, it will be recalled, figured in rail making and the shell rounds for the European nations were held up to a high standard.

In steel making special alloy steels were in demand, especially for motor vehicles, and an interesting development was a large plant with two blast furnaces whose output would go directly into finished castings by some special process that was not revealed.

While railway rails occupied a subordinate position in steel manufacture, the discussion of the various metallurgical problems involved in their making continued. Rails of 120 pounds were beginning to be used as compared with 56 pound rails 40 years earlier, but in this interval, while the weight of the rail had little more than doubled, the loads had increased from four to six times and the train speeds had more than doubled. The main difficulty was the presence of transverse fissures which could not be detected until failure and a train wreck resulted. The cause of this trouble was a matter of controversy between railway engineers and steel works metallurgists. The former tried to assert it was due to bad mill practice and the latter that it resulted from a plastic flow of the steel in the head of the rail due to the tremendous and concentrated loads directly impressed from the wheels.

**FERRO-ALLOYS.** In 1916 there was an increased amount of various alloys used in high-speed tool steel. Claims of great advantages were made for uranium steel, while vanadium steel continued in demand on account of its elasticity and shock-resisting qualities. There were no striking innovations in the metallurgy of ferro-alloys or new alloys developed. New plants were started and the capacities of many existing works increased, notwithstanding which the product was maintained at high quality and was eagerly availed of, as exports were forbidden from Europe. American metallurgists were successful in working up either native ores or, where they could be obtained from foreign sources, turning out a product in no way inferior to that previously imported. Munitions steel required considerable ferrosilicon and this was made electrically at Niagara Falls, where one calcium carbide plant was devoted to the production of ferrosilicon, and at Keokuk, Iowa. In addition to supplying domestic demand, a small amount of ferrosilicon was

exported. The annual production was estimated at 45,000 tons. Ferromanganese was being increasingly made in the United States, as was also the case with ferrovandium. Some of these alloy materials were obtained by the Goldschmidt Thermit process, but most of them were produced in the electric furnace. Ferrochrome was being made in the electric furnace for the steel industry in large part from foreign ore held in the United States, and an adequate supply of ferro-tungsten was produced for domestic needs with a surplus for export. Ferro-titanium was produced at Niagara Falls, and also there was manufactured ferromolybdenum for export, its purpose being stated to be for the lining of big guns.

**ELECTRO-METALLURGY.** The growth of the electric steel industry in 1916 was remarkable, and most of all in the United States. There was an increase of 63 furnaces during the year, or 46.3 per cent, and in Canada an increase of 11. The detailed statistics and the types of the furnaces as compiled by the *Iron Age* (New York) are shown in the accompanying table. It will appear that the Heroult furnace led not only in Europe but also in the United States and Canada, and in the latter countries the installations for the year were mainly for tool and special steel plants, five for seamless tubes, and only nine for steel casting, a purpose for which in 1915 most of these units were installed. At the Illinois Steel Company at South Chicago, two new 20-ton furnaces were being installed and with the two 15-ton furnaces in operation would form the largest electric steel plant in the world. Furnaces other than the Heroult, especially the Snyder, were installed in the United States, working not only to make electric steel but ferro- and other alloys.

In Great Britain there was also great progress in the electric steel industry and on Dec. 31, 1916, there were 88 electric furnaces as compared with 46 at the beginning of the year. Many of these naturally were installed in munitions plants. A new type of furnace, the Greaves-Etchells, was brought out in England in 1916 and before the end of the year some 20 were installed or contracted for. It was specially designed for Sheffield steel and used three-phase current. The other countries of Europe also reported increased numbers, as indicated by the table, but the figures for Germany are considered inadequate, as the electric steel output at the end of the year was estimated at the rate of nearly 200,000 tons as compared with 130,000 tons in 1915 and 90,000 tons in 1914. In Germany in 1916 there was twice as much electric furnace steel as that produced in the crucible.

Reference already has been made to electrolytic methods in the refining of copper and to new plants for the electrolytic refining of zinc ore. Bolivian tin ores were smelted and electrolytically refined at Perth Amboy, N. J., by the American Smelting and Refining Company, with a success that seemed to warrant the enlargement of the plant.

In 1916 the American aluminum industry gained and new plants and extensions were under way, so that a record production was secured which surpassed that of European countries. The imports into the United States fell off to about one-tenth of normal and the exports doubled. By 1925 it was estimated that aluminum measured by weight would be third in

TABLE OF TYPES OF ELECTRIC FURNACES BY COUNTRIES OF THE WORLD OPERATING OR CONTRACTED FOR ON JAN. 1, 1917, WITH TOTALS FOR 1916, 1915, 1913 AND 1910

\* Electric-Metals in Great Britain.

importance among the metals of the world, exceeded only by copper and iron.

**Bibliography.** Among the more important books on metallurgy published in 1916 were the following: George L. Heath, *The Analysis of Copper and Its Ores and Alloys*; Theodore J. Hoover, *Concentrating Ores by Flotation*, third edition; Henry Marion Howe, *The Metallurgy of Steel and Cast Iron*; Fred Ibbotson and Leslie Atchison, *The Analysis of Nonferrous Alloys*; Donald M. Liddell, *The Metallurgists and Chemists' Handbook*; Herbert A. Megraw, *The Flotation Process*; T. A. Rickard (editor), *The Flotation Process*; Albert Sauver, *The Metallurgy and Heat Treatment of Iron and Steel*, second edition, revised and enlarged.

See CHEMISTRY, INDUSTRIAL, section under *Metals*; and articles on separate metals, as GOLD, SILVER, etc.

**METALS.** See CHEMISTRY, INDUSTRIAL.

**METAPHYSICS.** See PHILOSOPHY.

**METCHNIKOFF, ELIE.** A French bacteriologist, died in Paris July 15, 1916. He was born in the Province of Kharkov, Russia, May 15, 1845, his father an army officer, his mother a Polish Jewess. His education was obtained at the University of Kharkov, at Giessen, Göttingen, and Munich, and at Naples. From 1870 to 1882, when he resigned to devote himself wholly to research, he held the chair of zoölogy at Odessa. His theory of phagocytes or "microbe eaters" attracted the widest attention when it was advanced in his paper on "Intracellular Digestion," and led to important conclusions with regard to immunization effected by the white blood corpuscles. Metchnikoff returned again to Russia, from Messina, but soon settled in Paris, where he became identified with the work of the Pasteur Institute. By 1888 Pasteur had set aside a laboratory for his use, and

since 1904 he had been sub-director of the Institute, under Roux. Upon taking up his residence in Paris, he became a French citizen. The subject to which perhaps he devoted most attention, and which made him famous, was the prolongation of life. In the region about his early home, and especially in Bulgaria, a remarkable number of persons live to be centenarians. It was Metchnikoff's theory, put forth in 1909, that the soured milk to which these people are accustomed as a principal article of diet contained bacilli which retarded or counteracted the intestinal putrefaction and autointoxication which seemed to be responsible for senility. It was his belief that it should be possible for persons who had no organic disease to live to be 150. He held, however, that man's body was not yet "ready" for his brain, which, in his opinion, had originally been a freak anthropoid ape development. In particular he believed that the large intestine was a useless organ. He himself died of heart disease at 71. Metchnikoff also made researches into typhoid fever, cancer, diabetes, anthrax, cholera, plague, comparative pathology of inflammation, and immunity in infectious diseases. In 1912 he announced the discovery of microbes, to be found only in the intestines of the dog, which he called "glycobacteria," and which he said were so needed in the large intestine of man that inoculation with them, in his opinion, would go farther to prolong life than even the lactic acids. With Prof. Paul Ehrlich he divided the Nobel prize for medicine in 1908, devoting the amount thus received to the cause of science. Metchnikoff had been the first, in 1903, to reproduce syphilis in a lower animal (the chimpanzee), and this was the basis for important researches by other scientists. Among these was Ehrlich, who discovered

a remedy for the disease in salvarsan. Metchnikoff's books which have been published in English translations include: *Lectures on the Comparative Pathology of Inflammation*; *Immunity in Infectious Diseases*; *The New Hygiene*; *The Nature of Man*; and *The Prolongation of Life*.

**METEOROLOGY.** The death roll for 1916 includes the names of Prof. Cleveland Abbe (q.v.), chief meteorologist of the United States Weather Bureau; Prince Boris Galitzin, director of the Meteorological Service of Russia since 1913; Henrik Mohn, founder and director of the Norwegian Meteorological Service from 1866 until his retirement in 1913; and Dr. Robert H. Scott, for many years head of the British Meteorological Office.

**SLEET.** Many of the terms used in meteorology are also in common colloquial use, and have acquired such a diversity of meanings that it is of the utmost importance that they should be defined with precision. Among them are the terms sleet, ice storm, glazed ice, and others of a similar nature. Of these none perhaps has been used more loosely in the United States than the first. Accordingly, the United States Weather Bureau appointed a committee to formulate suggestions for an appropriate nomenclature of sleet. After a careful examination into the etymology of the word, its early and more recent definitions, and its usage by meteorologists, the committee decided that the fundamental confusion of usage in the United States arose from the application of the term to two forms of frozen precipitation, one of which is frozen in the free air, and the other after contact with chilled terrestrial objects, and it recommended that the term sleet should be confined to the former, while the latter should be designated as "glaze." The practice of using the term ice storm to designate the icy coating instead of the general weather conditions causing it was strongly disapproved.

**METEOROLOGY OF THE MOON.** During the nineteenth century the prevailing belief concerning the moon was that it was a dead planet showing absolutely no change in any of its features. Many selenographers, however, have never held this view, and Prof. W. H. Pickering, in an interesting article in the *Monthly Weather Review* for February, 1916, gave an explanation of certain periodic changes which had been known for some time to occur in connection with some of the more prominent features of the lunar landscape. Certain white patches visible on some of the lunar mountains were attributed to the presence of snow. These occur not in the ravines, as is usually the case on our own planet, but on the ridges of the mountain slopes. Professor Pickering suggested that cracks exist along the crests of the ridges from which water vapor escapes, and that, owing to the deficiency of the lunar atmosphere, this vapor is immediately deposited as snow. Occasional haziness in the outlines and details of certain otherwise clearly defined patches was explained as being due to snowstorms. The increase and decrease in the size of the patches were shown to be intimately connected with the lunar phase.

**COST OF BAD WEATHER.** Prof. C. F. Talman, in an article in the *Mentor*, gave some figures showing the cost of bad weather in various countries. It was estimated that a difference of one inch in the July rainfall of the principal

corn-growing States of the Union meant a difference of \$250,000,000 in the value of the crop. The world's damage caused by hailstorms amounts to almost the same, and bad weather in the British Isles is responsible for a loss of \$100,000,000 to the farmers.

**CLIMATIC CORRELATIONS.** Evidence continued to accumulate concerning the interdependence of the weather conditions in widely separated regions of the earth. Mossman found a distinct see-saw of pressure, temperature, and wind velocity between Ross Sea in the Antarctic and stations in the South Orkneys and Graham Land, the former situated in latitude 78° south and longitude 165° east, and the latter in latitude 60° south and longitude 50° west. The seasonal departures from the normals of pressure and wind velocity were found to be of opposite signs, but in the case of the temperature this opposition was only strikingly evident in winter. H. Helm Clayton found a correlation between the average rainfall of the United States between the 80th and 110th meridians and that of central South America, as indicated by the overflow of the River Parana, while both showed an inverse correlation with the Australian rainfall. A similar correlation of temperature had previously been found from observations made at stations in Central Argentina and Central Australia. Okada furnished evidence of the remarkable relation existing between the pulsations of the Siberian anticyclone and the anomalous behavior of the air temperature on the east coast of Japan, a decline in the intensity of the anticyclone in March being associated with a fall of the mean air temperature of the latter region during the following July and August.

**PROGRESSIVE CHANGE OF EUROPEAN CLIMATE.** The theories of Huntington and Kropotkin regarding the progressive aridation of the earth were examined by Hildebrandsson in the light of the evidence afforded by European historians, and particularly by those of the Scandinavian countries. He arrived at the conclusion that, while evidence of climatic variations of long and short duration could be found everywhere, it was impossible to prove that the European climate had changed for better or worse during the historic period.

**METEOROLOGY AND THE WAR.** The meteorological establishments of the belligerent countries have been called upon to an unprecedented degree in connection with the war. Owing to the interruption of communications between the various nations at war, the issuing of ordinary meteorological forecasts was more or less suspended, but the services of meteorological experts were enlisted for the benefit of the armies in the field. Weather forecasts in connection with both military and naval operations assumed a new significance, and a knowledge of the behavior of the upper air was found essential for the information of the flying services, while the conditions of the surface atmosphere have played an important part in artillery operations in connection with gun-sighting and range-finding.

**OTHER EVENTS.** The Marcellus Hartley gold medal of the National Academy of Sciences for eminence in the application of science to the public welfare was awarded to Prof. Cleveland Abbe in consideration of his distinguished service in inaugurating systematic meteorological observations in the United States.

**METHODIST BROTHERHOOD.** As a result of the action of the general conference of the Methodist Episcopal Church in 1916, the Methodist Brotherhood no longer exists as a distinct connectional organization. The Board of Sunday Schools takes over the responsibility of promoting all men's organizations within the Church, including the brotherhood, but the latter as a local organization to be established in connection with any given church remains intact. The Board of Sunday Schools agrees to provide chapters of the brotherhood with literature, emblems, charters, and such supplies as they may require. The adult department of the Board of Sunday Schools has direct charge of the different forms of men's organizations established within the Church. Two advantages result from this change by the general conference. The first is, that a single board of the Church directs the enlisting and organization of the men of the churches and communities. The Church is relieved of duplications, embarrassing parallel movements, and unnecessary expense. The second is, the local church is charged with the responsibility of determining the particular form its organization of men shall take. The purpose now is to have every Bible class of men embody in its programme social and fraternal activities such as characterize the brotherhoods, and to have every brotherhood organization emphasize Bible study and activities of worship such as characterize Bible class organization. In 1916 there were enrolled in the men's Bible class and brotherhood organizations about 500,000 men.

**METHODIST EPISCOPAL CHURCH.** The total number in full membership in this denomination in 1916 was 3,723,361, with 407,976 probationers, 30,738 churches, 18,883 ministers in full connection, 1621 on trial, and 15,239 local preachers. This represents a gain of 100,891 in full membership over 1915, of 84 in churches, and of 117 in ministers in full connection. The average salary of pastors in 1916 was \$996.52. The total membership, including probationers, in 1916 was 4,131,337, a gain of 103,173 over the corresponding figures for 1915. The total number of Sunday schools in 1916 was 36,121, with 408,244 officers and teachers, an increase of 2815 over 1915. The Sunday school pupils in 1916 numbered 4,579,029, an increase of 81,565 over 1915. The total membership of the Epworth League in 1916 was 830,889. The estimated value of church property in 1916 was \$217,646,570, an increase of \$5,321,102 over 1915; and of parsonages \$36,174,635, an increase of \$964,118 over 1915.

The missionary activities of the denomination are conducted through the Board of Foreign Missions, the Board of Home Missions and Church Extension, the Woman's Foreign Missionary Society, and the Woman's Home Missionary Society. The mission conferences of the denomination are: Austria-Hungary, Bulgaria, Burma, France, Inhambane, Kiangsi, North Africa, North Andes, Pacific Swedish, Porto Rico, Rhodesia, Southern Swedish, West Central Africa, and West China. Extensive missions are maintained on four continents, as follows: Asia: India, Burma, Malaysia, the Philippine Islands, Java, Borneo and Samatra, China, Japan, and Korea; Africa: Liberia, Angola, Madeira Islands, Southern Congo, Portuguese East Africa, Rhodesia, Algeria, and

Tunis; South America: Argentina, Paraguay, Uruguay, Bolivia, Chile, Peru, and Panama; Europe: The Board of Foreign Missions maintains mission organizations in Italy, France, Bulgaria, Austria-Hungary, and Russia, and makes grants in aid to the Methodist Episcopal conferences in Germany, Switzerland, Denmark, Norway, Sweden, and Finland. Thus in all 34 different countries are benefited, and the gospel is preached in about twice that number of languages. In 1916 the total number of foreign missionaries was 1539, assisted by 11,422 native workers, and an enrolled membership of 429,235, besides baptized children and unbaptized adherents, making a total of 661,306, a net gain of 25,911 over 1915. In 1916 the receipts of the Board of Foreign Missions were \$1,933,256; Board of Home Missions and Church Extension, \$1,145,029; Woman's Foreign Missionary Society, \$1,033,770; Woman's Home Missionary Society, \$991,236.

Under the general charge of the Board of Education are maintained in the United States and abroad 420 educational institutions, including 42 colleges and universities, of which the most important are De Pauw University, Indiana; Northwestern University, Illinois; University of Southern California; Ohio Wesleyan University; Boston University; and Wesleyan University. There are 10 theological schools for white students and six for colored.

Besides the missionary and Sunday school organizations and the Board of Education, there are: the Methodist Book Concern, through which the publications of the denomination are issued; the Epworth League, the association for the young people of the Church; the Methodist Federation for Social Service; the Freedman's Aid Society; the Deaconess Work; and the Temperance Society. The bishops chosen in 1916 were: William F. Oldham; Charles Bayard Mitchell; Franklin Hamilton; Matthew Simpson Hughes; Thomas Nicholson; Herbert Welch; Adna W. Leonard.

**METHODIST EPISCOPAL CHURCH, SOUTH.** The larger number of Methodists in the Southern States are included in this denomination. According to official returns there were at the beginning of 1916, 2,102,065 members, including local preachers, a gain of 66,418 over 1915. There were in 1916, 7440 traveling preachers, not including supplies, a gain of 116 over 1915; 147,155 Sunday school officers and teachers, an increase of 7354 over 1915; 1,697,163 Sunday school scholars, an increase of 115,692 over 1915; 133,063 Epworth League members, an increase of 9055 over 1915; 17,232 churches, an increase of 151 over 1915; value of churches, \$59,050,201, an increase of \$1,372,293 over 1915; number of parsonages, 5418, an increase of 50 over 1915; value of parsonages, \$11,420,296, an increase of \$292,751 over 1915.

The work of the denomination extends over territory in which there are 330 districts and 50 conferences, including the missionary conferences of Brazil, Central Mexico, China, Cuba, German Mission, Korea, Mexican Border Mission, and South Brazil. The total salaries for the preachers in charge amounted in 1915 to \$4,795,841, the average ministerial salary being \$772. The total expenditure for benevolent purposes, not including gifts for endowments and buildings for colleges, was \$1,449,710 in 1915, or 70.3 cents per capita.

In 1916 there were 12 active and two superannuated members constituting the board of bishops. The official headquarters of the Church are in Nashville, Tenn., where the publication interests are located. Twenty Wesley houses, which are social settlements for the whites, are in charge of and maintained by a committee of the Women's Missionary Council. There are three Bethlehem houses for the negroes. About 50 deaconesses give their entire time to social service. The next general conference will be held in May, 1918.

**METHODISTS, BRITISH.** The Methodist Publishing House of London has published the following statistics of British Methodism for 1916. They contain not only the returns for Great Britain and Ireland, but Methodist churches and missions in foreign fields. The returns for Canadian Methodism will be found in a separate article. British Methodists at home and abroad had in 1916 a total of 10,356 ministers; 64,469 lay preachers; 1,804,890 church members and probationers; 25,803 Sunday schools; 308,731 Sunday school officers and teachers; 2,522,793 Sunday school scholars; and 25,961 churches, etc. The churches, etc., for Great Britain are not included in the last mentioned total, but their seating capacity is given as 2,378,356.

**WESLEYAN METHODISTS.** This is the largest branch of the denomination in Great Britain and Ireland. In 1916 it had 2855 ministers; 19,910 lay preachers; 522,764 church members and probationers; 7814 Sunday schools; 127,541 Sunday school officers and teachers; 917,328 Sunday school scholars. Of this total Great Britain had 2603 ministers; 19,211 lay preachers; 494,993 church members and probationers; 7478 Sunday schools; 125,231 Sunday school officers and teachers; 893,527 Sunday school scholars. In Ireland in 1916 the Wesleyan Methodists had 252 ministers; 699 lay preachers; 27,771 church members and probationers; 336 Sunday schools; 2310 Sunday school officers and teachers; 23,801 Sunday school scholars; 547 churches, etc. In foreign missions the Wesleyan Methodists in 1916 had 735 ministers; 6128 lay preachers; 183,231 church members and probationers; 2182 Sunday schools; 8752 Sunday school officers and teachers; 134,059 Sunday school scholars; and 3538 churches, etc. In the French Conference of Wesleyan Methodists in 1916 there were 35 ministers; 84 lay preachers; 1733 church members and probationers; 36 Sunday schools; 163 Sunday school officers and teachers; 2251 Sunday school scholars; and 131 churches, etc. In the South African Conference the Wesleyan Methodists in 1916 had 282 ministers; 4407 lay preachers; 139,161 church members and probationers; 890 Sunday schools; 3133 Sunday school officers and teachers; 42,223 Sunday school scholars; and 4160 churches, etc.

**PRIMITIVE METHODISTS.** Ministers in 1916, 1157; lay preachers, 15,336; church members and probationers, 205,323; Sunday schools, 4172; Sunday school officers and teachers, 56,428; Sunday school scholars, 436,077; churches, etc., 4807.

**UNITED METHODIST CHURCH.** Ministers in 1916, 812; lay preachers, 6095; church members and probationers, 183,431; Sunday schools, 2272; Sunday school officers and teachers, 39,842; Sunday school scholars, 287,887; churches, etc., 3029.

**WESLEYAN REFORM UNION.** Ministers in 1916, 25; lay preachers, 489; church members and probationers, 8810; Sunday schools, 197; Sunday school officers and teachers, 2633; Sunday school scholars, 23,394; churches, etc., 213.

**INDEPENDENT METHODIST CHURCHES.** Ministers, 402; church members and probationers, 9068; Sunday schools, 160; Sunday school officers and teachers, 3070; Sunday school scholars, 26,551; churches, etc., 147.

**AUSTRALIAN METHODIST CHURCH.** Ministers, 985; lay preachers, 8634; church members and probationers, 149,878; Sunday schools, 3849; Sunday school officers and teachers, 21,964; Sunday school scholars, 203,365; churches, etc., 5147.

**NEW ZEALAND METHODIST CHURCH.** Ministers, 198; lay preachers, 946; church members and probationers, 24,730; Sunday schools, 407; Sunday school officers and teachers, 3276; Sunday school scholars, 29,448; churches, etc., 460.

**JAPAN METHODIST CHURCH.** Ministers, 241; church members and probationers, 15,364; Sunday schools, 340; Sunday school teachers and scholars, 28,438; churches, etc., 245.

**METHODISTS, CANADIAN.** The Methodist Church in Canada was formed in 1883 by the union of the Canadian branches of the Wesleyan Methodist Church, the Methodist Episcopal Church, the Primitive Methodist Church, the Methodist New Connexion Church, and the Bible Christian Church. The territory covered by the operations of the Church includes the Dominion of Canada, Newfoundland, Bermuda, and mission fields in China and Japan. For administrative purposes there are 12 conferences: Toronto, London, Hamilton, Bay of Quinte, Montreal, Nova Scotia, New Brunswick and Prince Edward Island, Newfoundland, Manitoba, Saskatchewan, Alberta, and British Columbia.

In 1916 there was a total membership of 378,802; ministers, 2860; churches, 3782. Under the educational control of the Church are 17 colleges and universities, of which the most important are: Victoria University, Toronto; Mount Allison University, Sackville, N. B.; Wesleyan Theological College, Montreal; Wesley College, Winnipeg. The total value of all buildings and endowments is \$7,200,391. There were in 1916 3818 Sunday schools, with 42,590 officers and teachers, and 415,337 scholars. There were 2327 Young People's Societies, with 93,530 members. The total value of church property, including churches, colleges and endowments, and parsonages, was \$43,242,261. The total missionary income for 1916 was \$661,561.

The principal officers of the Church in 1916 were: Samuel Dwight Chown, general superintendent; Albert Carwan, general superintendent emeritus; I. Albert Moore, secretary of the general conference; William Briggs, book steward; W. B. Creighton, editor of the *Christian Guardian*; A. C. Crews, editor of Sunday school publications; D. W. Johnson, editor of the *Wesleyan*.

**METHODISTS, COLORED.** In 1916 there were 341,783 colored members of the Methodist Episcopal Church. The Colored Methodist Episcopal Church, an offshoot of the Methodist Episcopal Church, South, had, according to the latest official figures available, 3072 ministers, 3196

churches, and 240,798 members. The African Methodist Episcopal Church, which was formed from the Methodist Episcopal Church in 1815, had, according to the latest statistics obtainable, 5000 ministers, 6000 churches, and 620,000 members. The African Methodist Episcopal Zion Church, organized in 1821, had, according to the latest obtainable returns, 3552 ministers, 3180 churches, and 568,608 members. The Union American Methodist Episcopal Church (Colored) had 170 ministers, 212 churches, and 19,000 members. The African Union Methodist Protestant Church (Colored) had 200 ministers, 125 churches, and 4000 members. The Reformed Zion Union Apostolic Church (Colored) had, in 1906, 33 ministers, 45 churches, and 3059 members. The Reformed Methodist Union Episcopal Church (Colored) had 72 ministers, 58 churches, and 4397 members.

**METROPOLITAN OPERA HOUSE.** See MUSIC, sections *Opera* and *Ballet*.

**MEUSE, BATTLE OF THE.** See WAR OF THE NATIONS.

**MEXICO.** A federal republic situated between the United States and Central America. It is called officially both *Estados Unidos Mexicanos* and *República Mexicana*. The capital city is Mexico, in the Federal District; but on Feb. 14, 1916, the *de facto* (Constitutionalist) government declared Querétaro the provisional capital. During 1916 unsettled and in large part chaotic conditions continued in the industrial, commercial, and administrative activities of the republic. As in the preceding year, very little authoritative statistical information was available.

**AREA AND POPULATION.** The area of Mexico is stated at 1,987,201 square kilometers (767,258 square miles). The census of Oct. 27, 1910, returned a population of 15,160,369, as compared with 13,607,259 in 1900. In 1900, pure whites, and nearly pure, constituted about 19 per cent of the population; persons of mixed white and Indian blood, about 43 per cent; Indians, about 38 per cent. In 1910, males numbered 7,504,471, and females 7,655,848. Spanish-speaking persons in 1910 numbered 13,143,372; most of the remaining inhabitants spoke Indian languages, as Nahuatl (516,410), Maya (227,883), Zapoteco (224,863), Otomi (209,640), Mixe (166,157). Persons of Mexican-birth numbered 15,043,842; persons of foreign birth, 116,527, as follows: Spanish, 29,541; Guatemalan, 21,434; American, 20,639; Chinese, 13,203; British, 5264; French, 4604; German, 3827; Cuban, 3418; Turkish, 2907; Italian, 2595; Japanese, 2216; other, 6979.

According to the 1910 census, Roman Catholics numbered 15,033,176; Protestants, 68,839; adherents of the Orthodox Church, 630; Mohammedans, 602; Buddhists, 6237; Jews, 254; other religious adherents, 5605; without religion, 25,011; unknown, 20,015.

The area by states and the population according to the census of 1910 and an estimate of 1912, together with approximate density per square kilometer in 1912, are shown in the following table:

States	Sq. km.	Pop. 1910	Pop. 1912

\* Territory. † Federal District. ‡ Including islands, 4042 sq. km.

Population of the larger cities at the 1910 census: Mexico, 471,066; Guadalajara, 119,468; Puebla, 96,121; Monterrey, 78,528; San Luis Potosí, 68,022; Mérida, 62,447; León, 57,722; Veracruz, 48,633; Aguascalientes, 45,198; Morelia, 40,042; Chihuahua, 39,706; Pachuca, 39,009; Oaxaca, 38,011; Guanajuato, 35,682; Saltillo, 35,414; Orizaba, 35,263; Torreón, 34,271; Querétaro, 33,062; Durango, 31,763.

Complete separation of church and state has existed in Mexico since 1859. Although the 1910 census returned about 97 per cent of the people as Roman Catholic, large numbers have drifted away from the practical influence of the Church or even become antagonistic to it. Neither the leaders of the Constitutionalist government nor their opponents in the civil wars of recent years have appeared to be in sympathy with the Church. In the *Bulletin* of the Pan-American Union for May, 1916, it was stated that a divorce law recently promulgated allows the dissolution of marriage, three years after consummation, by the mutual consent of the husband and wife and permits the remarriage of the divorcees.

**INDUSTRIES.** According to reports current during 1916, there was in general no considerable return to normal industrial conditions. Even before the devastating civil wars agricultural production, in proportion to the country's capabilities, was small. There are vast areas of fertile soil and much other land that can profitably be made fertile by irrigation. But the existence of enormous estates used unadvantageously for grazing, the difficulty in obtaining small holdings, and the primitive methods of cultivation retarded agricultural progress. Agrarian conditions are one of the chief causes of the popular discontent that has made possible the civil wars. In time of peace, however, Mexico has produced large quantities of corn, beans, sugar cane, coffee, and (in the south) sisal hemp. More than either agricultural or stock raising, development of the exceptionally

rich mineral resources has attracted foreign capital and contributed to such economic prosperity as the country enjoyed under the presidency of Porfirio Diaz. In the year 1911-12 the total value of the mineral output was over 209,700,000 pesos; gold production amounted to 1,173,957 ounces, and silver 80,205,670. In the 35 years from 1877-78 to 1911-12, the gold output totaled 395,904.7 kilograms, valued at 527,871,760 pesos; the silver output, 49,600,726.5 kilograms, valued at 1,973,394,124 pesos; total value of gold and silver, 2,501,265,884 pesos. In 1916 large deposits of manganese were reported from Lower California. The development of the Mexican petroleum industry, which centres in the Tampico region and the Isthmus of Tehuantepec, has been very rapid during the last 10 years. The output increased from about 1,000,000 barrels in 1907 to 26,235,403 barrels in 1914 and about 35,010,000 barrels in 1915. Manufactured asphalt and residual pitch from Mexican petroleum reached a total export tonnage estimated at 388,318 in 1915, with a value of \$3,730,436.

In the autumn of 1916 was published a list of foreign investments in Mexico; the total was \$1,641,054,180, composed as follows: American capital, \$1,057,770,000; English, \$321,302,800; French, \$143,446,000; various, \$118,535,380. In addition, Mexican investments in the same enterprises were estimated at \$793,237,242, making a grand total of \$2,434,291,422. The largest amounts of American money were invested as follows: railway shares and bonds, \$644,390,000; mines, \$223,000,000; domestic bonds, \$52,000,000; smelters, \$26,500,000; bank deposits, \$22,700,000; petroleum, \$15,000,000; rubber, \$15,000,000; factories, \$9,600,000. English investments included: railway shares and bonds, \$168,917,800; domestic bonds, \$67,000,000; bank deposits, \$43,600,000; woodlands, \$10,300,000.

COMMERCE. Commercial statistics for the years 1914 and 1915 are not available. An estimate published in the *Bulletin* of the Pan-American Union for November, 1916, placed the total import value in 1914 at \$78,000,000 and in 1915 at \$85,000,000; export value in 1914, \$165,000,000, and in 1915, \$156,000,000. In the fiscal year 1910-11, imports were valued at \$102,937,000, and exports at \$146,877,000; 1911-12, \$91,331,000 and \$148,995,000; 1912-13, \$97,886,000 and \$150,203,000.

The 1912-13 export value in pesos was 300,416,000. The more important items composing this figure were, in thousands: Silver, 91,287; gold, 39,596; copper, 36,522; sisal hemp, 30,133; coffee, 11,263; hides, 11,162; beans, 8417; rubber, 8363; live animals, 7556; guayule, 6238; chicle, 4930; lead, 4907; chick-peas, 4349; ixtle, 3646; woods, 3365; vanilla, 3815.

COMMUNICATIONS. The length of railway in operation on Sept. 30, 1913, was 25,398 kilometers (15,782 miles), as compared with 25,287 kilometers (15,713 miles) on Sept. 30, 1912. No new construction was reported for 1914, and only about 35 miles for 1915, while a great extent of line was damaged or destroyed in the course of the civil war. Nearly 79 per cent of the railway is under control of the Federal government. The first section of the Cuzco-Santa Ana Railway, extending 20 miles to the village of Poroy, was opened on October 22nd. The Federal telegraph, as reported for 1913, comprised 94,512 kilometers (58,727 miles), with 516 offices; other telegraphs, 8387 kilometers (5211 miles). Radiotelegraph stations, 24. Some activity in radiotelegraph installation was reported in 1916. Post offices (1913), 2911.

FINANCE. The monetary unit is the silver peso; its par value is 49.846 cents. As a result of the continued civil war metallic currency was practically withdrawn from circulation, while enormous quantities of paper money were issued. The paper peso fluctuated in value in 1915 from 2 to 8 cents. In the fiscal year 1912, the revenue of the Federal government was 105,203,087 pesos silver, and the ordinary expenditures 96,985,953 pesos silver. Most of the revenue is derived from customs and from taxes on real property. The principal expenditures are for war and the public debt. The budget for the fiscal year 1915 placed the revenue at 145,957,000 pesos silver and the expenditure at 152,204,898 pesos silver. No statistical account of Federal finances in 1916 is available. The outstanding foreign debt, as reported for Dec. 31, 1915, was £38,531,920 (including the Mexico City loan).

GOVERNMENT. Mexico is a federation of states autonomous in local affairs. Under the constitution, the president and vice-president are elected by indirect vote for six years. The president is assisted by a cabinet of eight members. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (56 in number, two from each state and the Federal District) are elected for four years, and Deputies (233) for two years, all by direct vote. The states have their own popularly elective governors and legislatures. In October, 1915, the governments of the United States, Argentina, Brazil, Bolivia, Chile, Uruguay, and Guatemala recognized Gen. Venustiano Carranza, leader of the Constitutionalists, as chief of the executive power of the de facto government of Mexico. General Carranza continued as chief executive during 1916.

## HISTORY

**INTERNAL CONDITIONS.** As a result of the prolonged revolution, wretched conditions were reported throughout the country early in the year. In the north the rich mines were no longer working and in wide tracts of agricultural territory, farming and animal industries had been brought to an end by the repeated attacks of bandits. The spread of typhus and great suffering from starvation were reported among the poor and there seemed little prospect of realizing the programme for the protection of life and property held out by Carranza. The long expected land reform project was postponed. The religious liberty, which he had promised to uphold, was invaded by fanatics among his own followers who persecuted the clergy, confiscated church property, and hampered the freedom of worship. It was under these conditions that Villa made his determined move against Americans with the design undoubtedly of bringing about American intervention.

**MASSACRE OF SANTA YSABEL.** In the latter part of 1915 the United States in company with other countries had recognized Carranza as the *de facto* president of Mexico. This action aroused the deepest feelings of bitterness in Francisco Villa, which, in connection with defeats of his forces by the officers of Carranza, had transformed him from a former friend of the United States to an enemy. This feeling was soon to take active form. After several weeks in which nothing had been heard of the movements of Villa and his band, suddenly news came that on January 11th he had stopped a train near Santa Ysabel, about 50 miles from the city of Chihuahua, and had taken from it a number of American citizens who, for the most part, were mine officers and engineers. The party of Americans included Charles R. Watson, the general engineer of the mines and chairman of the Chihuahua Miners' and Smelters' Association, W. J. Wallace, superintendent of the company's mines, the foreman of the mines, and the bookkeeper. In all there were 19. These men were taken from the train, stripped of their possessions and clothing, lined up before firing squads, and killed. One survivor of the massacre who escaped unobserved, brought the news to El Paso. It was claimed that this party of travelers had the assurance of the American consul at Chihuahua that it was safe to travel in the region in which they intended to go. General Carranza, at the request of Secretary Lansing, at once undertook the capture and punishment of the murderers. The offer of American troops to assist in the pursuit was refused. After several days two of Villa's officers, Almida and Rodriguez, were captured at Madera, following a fight with members of their band in which 40 were killed. Both these officers were shot. After further search other officers of Villa were captured and shot.

**DISCUSSION IN THE UNITED STATES.** The murder of these American citizens caused much feeling in Congress, which was at the time in session. In the Senate, Senator Sherman introduced a resolution which amounted to a demand for an immediate invasion of Mexico, and containing the provision that the United States should invite the six Latin-American nations which had recognized Carranza to join with the United States in demanding immediate action

by Carranza to bring about conditions of safety in Mexico. If he should fail in doing this, the United States would intervene with armed forces. Still another resolution proposed the formation of a neutral zone in Northern Mexico to be policed by American and Mexican troops. Other speeches were made in which it was urged that the time had come for laying aside the policy of "watchful waiting." Senators Lodge and Borah of the Foreign Relations Committee urged a favorable report on the resolution, saying that it would have a salutary effect on Carranza. In the House of Representatives also speeches were made denouncing the course of the Government. The leaders in Congress succeeded after a time in restoring a measure of calm and preventing action on the various resolutions, in order not to embarrass President Wilson. Senator Stone, chairman of the Committee on Foreign Relations, speaking for the President, declared that it would be monstrous for armed forces of the United States practically to make war on Mexico immediately after the recognition of Carranza without giving him time and opportunity to restore stable conditions. The only action taken by the Senate was to agree to a demand made by Senator Fall of New Mexico for information relating to Mexican conditions as they affected Americans, including reports of the Brazilian ambassador in the city of Mexico, who had been acting for American interests from the time that President Wilson broke off relations with Huerta. This information Secretary Lansing refused to furnish on the ground that it was of too confidential a nature to be made public. He did send data relating to the number of Americans who had lost their lives in Mexico. These figures showed that 76 Americans had been killed in the three years preceding Jan. 1, 1916. Of these, 24 had been killed from causes due directly to revolution, 44 by bandits, Indians, and civilians, and 8 from a railroad accident, which was a result of the disorders. From 1910 to 1912 the number of Americans killed was 47. Between 1913 and 1916, 20 American civilians, 16 American soldiers, and 62 Mexicans were killed on the American side of the border.

**THE COLUMBUS MASSACRE.** No further progress was made in the pursuit of Villa, and various reports indicated that he was still in the neighborhood of the scene of his crime. In the latter part of February he was reported to be approaching the Texas boundary, and American troops were placed in readiness to meet him. Instead of attempting to reach the border, however, he diverted his course and attacked the Carranza troops at Montezuma, south of Juarez. He again disappeared, although various reports showed him to be still within a short distance of the border. On March 9, 1916, the border town of Columbus in New Mexico was suddenly raided at night by about 1500 bandits headed by Villa. The 13th United States cavalry was stationed at this point, but the bandits succeeded in eluding them, and had reached the town before the alarm was given. The encampment was some distance from the town proper. It was evident that spies had previously informed Villa of the location of the troops. The telephone and telegraph wires were cut so that no calls for help could be sent. In addition, Villa had misled the American authorities, stating that he was in the neighborhood of Nogales.

CAMP OF AMERICAN EXPEDITIONARY FORCE UNDER GENERAL PERSHING AT COLONA DUBLAN, MEXICO

The bandits led by Villa raided the post office and several stores, set fire to a number of houses, and shot many residents before the American troops were able to reach the scene. The greatest brutality was shown toward both men and women. Following two hours' looting and fighting the bandits succeeded in withdrawing, after having killed 11 civilians and 9 troopers. They lost 27 of their own number, including Lopez, the second in command. A body of 250 cavalymen pursued the band for five miles into Mexican territory. They succeeded in killing 40 of the bandits and lost one of their own number.

**AMERICAN PUNITIVE EXPEDITION.** This exploit aroused the greatest excitement and indignation throughout the United States. The President and his cabinet consulted and decided at once to send a punitive expedition to Mexico with or without the consent of Carranza. The latter expressed regret for the outrage to the American government, but persisted in withholding his consent for United States troopers to enter the country. So far from showing a disposition actively to aid the United States government, he in effect condoned the raids by Villa's bandits, comparing them to similar attacks made in former years by American Indians on Mexican territory. He in addition made a demand to the State Department in a note dated March 11th, for the necessary permission for Mexican forces to cross into American territory in pursuit of possible American raiders on Mexican territory. On the day following he issued a longer manifesto which amounted to refusal to permit the pursuit of Villa on Mexican soil unless reciprocal right was granted to Mexican forces. To this demand President Wilson gave assent, with the provision that the conditions calling for it must be identical. He agreed that Mexican troops might cross the international boundary to pursue "lawless bands of armed men who entered Mexico from the United States, committed outrages on Mexican soil, and fled to the United States."

Somewhat ironical was the gratification expressed by the President that Carranza had shown "so cordial and friendly a spirit of co-operation." Following this, Carranza attempted to restrict the scope of the expedition by proposed conditions that would limit the force to 1000 men composed entirely of cavalry. He consented to the use of machine guns, but suggested also that there should be no infantry or artillery employed. He added also the condition that the pursuit must not continue for more than 40 miles from the boundary line, and must be discontinued and the troops withdrawn within five days except in unusual cases. In addition to all this the pursuing forces must not cross the line within six miles of any town on the border, or occupy any city or town. Other conditions were included, the most of which were rejected by the State Department. Agreement, however, was made to the points of departure and to the non-occupation of towns. Carranza refused to acknowledge that Mexico had consented to permit the punitive expedition. The American government announced that its operation would be strictly confined to the pursuit of Villa and "in no circumstances would be suffered to infringe in any degree upon the sovereignty of Mexico or develop into intervention of any kind." The proposed expedition, it was declared, was "de-

liberately intended to preclude the possibility of intervention."

The House of Representatives by a vote of 236 to 1 supported the action of the President. This vote was taken in the passage of a resolution authorizing the increase of the army to the maximum permitted by the law. Both the House and the Senate also endorsed the official announcement of the actual object of the expedition. A joint resolution introduced in the Senate by Senator La Follette setting forth the purpose of the expedition as before outlined by the President, was unanimously passed. A similar resolution was passed in the House.

At this time there were about 19,000 American troops along the international border, and General Funston, who had command, was at once ordered to organize an expedition. The command was under Gen. J. Pershing, who was given a free hand, in capturing Villa dead or alive. Carranza was mollified by the declaration of American intentions through Congressional action, and he somewhat ungraciously ordered his troops to cooperate with the American forces. Commands were given to General Obregon, who was now minister of war, to this effect. In various cities of Mexico, however, great hostilities were shown toward Americans. There were riots at Juarez and Torreon, where the inhabitants were very favorably disposed toward Villa.

**THE AMERICAN ADVANCE: THE PARRAL INCIDENT.** The punitive expedition crossed the border on March 15th. It was composed of two columns; the larger, which consisted of about 4000 men, under the personal command of General Pershing, started from Columbus. They were accompanied by a party of Carranza's troops. The other force, which was considerably smaller, was under the command of Col. George A. Dodd. This column crossed the border some distance west of Columbus, and after a march of 60 miles reached Casas Grandes, on March 17th. Objection was made by the Mexican commander in this city to the entrance of American troops, but assurance was given from Washington that the troops would not occupy the town. This city became the base of the expedition, and three divisions of troops were sent in different directions. One went toward Lake Babicora, 70 miles south, and the other two marched for Galeana, southwest of Casas Grandes, where they separated. One division marched toward Carmen, and the other to Cruces. The first named town is 65 miles east of Casas Grandes, and the other 50 miles south. Reinforcements were sent to General Funston for protecting the line of communication which extended a hundred miles from the border. On March 26th, the American troops had reached a point 200 miles beyond the border, and within the neighborhood of Chihuahua city. In this territory Villa was active. He made attacks on Mexican garrisons at various points, including the town of Guerrero, where he put to death over 170 prisoners whom he had captured. Villa was said to be seriously wounded in this attack. Two days following, on March 29th, his command was surprised by a column of American troopers, including the 7th and 10th cavalry, under Colonel Dodd. The American forces numbered about 400, and the Villistas about 500. The latter fled after a brief resistance and many of them were killed. The American loss was one killed and four wounded.

Villa escaped in a carriage. His band fled in the direction of Parral to the southeast, scattering into small parties. There were other smaller encounters between these bands and the American and Mexican troops.

The American line of communication was now 300 miles long, and great difficulty was experienced in providing food, ammunition, and other supplies. Carranza for a time refused to permit the use of the railroads for this purpose, and it was necessary to use motor trucks. In time he consented to a conditional use of the railroads, specifying that all goods must be shipped from one American to another neither of whom was to be directly connected with the army. He further stipulated that the trains must have no guards. For the first two weeks in April the pursuit continued with little result, except the dispersal of the bandit forces. But while there was no direct conflict between the Americans and the bandits under Villa there was on April 12th a serious clash between American troops and those of Carranza. This took place at the city of Parral, which was reached on April 12th by two detachments of the 13th cavalry commanded by Maj. Frank Tompkins. The force numbered only about 150 men, and approached the city for the purpose of purchasing supplies and consulting with the officers in regard to a site for making an encampment outside the city. Having previously sent a messenger to the mayor of the city, Colonel Tompkins, accompanied by a guard, visited the town. He was cordially received by the commander of the garrison, General Lozano, and arrangements were made for the purchase of food and for a camp site. Major Tompkins, accompanied by General Lozano and another Mexican officer, left the town for the purpose of examining a place for the proposed encampment. Shots were suddenly fired in that direction from the town, and shouts for Villa and against Americans were heard. General Lozano and the other Mexican officer at once rode toward the town as though to stop the firing, but this continued and was directed toward the American pack train and troops. Major Tompkins succeeded in rejoining the troops and took up a position with his troops north of the railroad. He observed that the Mexicans were making a flank movement with the intention of cutting off his troops from the road to the east and north. He called upon them to retire, but they ignored his request, and he ordered his troops to fire. A fight followed, during which the Americans slowly withdrew, pursued by about 300 Mexicans. Hostilities continued from 1 o'clock in the afternoon until 8 in the evening. The Americans had been attacked in the rear and on both flanks. They had finally established themselves in a village where they were able to find shelter behind buildings. The Mexicans approached and received a volley which killed about 40 men. Firing ceased at dark. Soon a messenger from General Lozano appeared, bearing a flag of truce, and a note saying that he had been unable to control his forces. A second message demanded that the Americans immediately withdraw, otherwise the attack would be renewed. At this time a squadron of the 10th cavalry with four machine guns, led by Col. W. C. Brown, appeared. Colonel Brown at once took command and replied to Lozano's message that he would not retreat unless ordered to do so by his commanding officer. Other Amer-

ican reinforcements soon appeared, including the detachment of the 11th cavalry commanded by Col. H. T. Allen. Hostilities were not resumed. The Americans lost during the affray two killed, six wounded, and one missing.

This incident aroused the American government to the fact that opposition to the punitive expedition was so strongly felt among the Mexicans as to bring about a very dangerous situation. This conviction was strengthened by a note from Carranza, written on April 12th, the day of the Parral incident, protesting against the further presence of American troops in Mexico, and demanded their immediate withdrawal. Carranza declared that the expedition had been undertaken through a misunderstanding on the part of the American government. While admitting that its purpose had been pursued in good faith he declared that he had no intention of agreeing to extending the time of the expedition to the length it had already gone. He particularly objected to the absence of any agreement permitting the reciprocal passage of the troops of both nations across the border, and on account of the failure of any written agreements he denounced the expedition as without warrant. In spite of this protest the American troops continued to remain in the positions in which they had been after the clash of Parral. Active operations, however, came to a standstill. Nothing further was heard of Villa.

THE EL PASO CONFERENCE AND THE GLENN SPRINGS RAID. An attempt to break the deadlock resulted in a conference at the beginning of May between Generals Scott and Funston, representing the United States, and Generals Obregon and Trevino, representing Mexico. The Mexican representatives insisted upon the immediate withdrawal of the American troops or that a date be set for such withdrawal. As the American representatives refused to accede to this there was for a time a deadlock. After further discussion a tentative agreement was reached on the basis of policing by the Americans of the "northern zone" of territory north of the international boundary, and of the "southern zone" by the Mexican troops. It was also decided to limit the American advance, and to withdraw the troops as soon as it appeared that the Villistas had been wholly eliminated.

In the midst of the conference in which an agreement was about to be reached along these lines, there was suddenly another raid by Villistas who, on May 5th, attacked the village of Glenn Springs, in Texas, 15 miles north of the border. There was a garrison of nine troopers of the 15th cavalry at this place. These men took refuge in an adobe hut where they were besieged by the invaders for three hours. Three of the troopers were killed and two wounded. The sergeant in command and three other survivors succeeded in carrying away the wounded, and the bodies of those that had been killed. A number of American ranchmen in the vicinity, attracted by the firing, came to the rescue, and by four o'clock in the morning the raiders withdrew, after looting the town. Before raiding Glenn Springs they had attacked the village of Boquillas, killed a boy, and taken two American prisoners. One of these was the proprietor of the only store in the place. An expedition under Maj. George Langhorne at once started in pursuit, and within two hours they had returned with 14 prisoners. The second rescue party was

led by Major Langhorne again pursuing the Villistas, and after a march of two days and a half rescued the two Americans who had been captured. Proceeding further the expedition met and engaged a group of bandits, killing five and capturing two. Before it returned it had penetrated 168 miles of Mexican territory.

Following these raids the conference at El Paso abruptly adjourned, without having reached any agreement.

**CARRANZA'S PROTEST.** On May 22nd Carranza addressed a long note to the State Department, again demanding the immediate withdrawal of the American troops. He questioned the sincerity of the United States government in sending out expeditions and demanded a definite statement of its purpose and aims in order to end "an unsupportable situation." The note further said, "The explanation given by the American government, in regard to the crossing of troops at Columbus, has never been satisfactory to the Mexican government; but the new invasion of their territory is no longer an isolated fact, and tends to confirm the Mexican government that something more than a mere error is involved." This later act of the American forces, he said, caused new complications for the Mexican government, increasing the difficulty of finding a satisfactory solution to the tenaciousness of the international situation. The Mexican government could not consider this last incident except as an invasion of its territory, and it was its duty to request the American government to order the immediate withdrawal of these new forces, and to abstain from sending any other expeditions of a similar nature. The reference to further expeditions was to the pursuit of Villistas by the forces under Major Langhorne. Included in this note was a threat that the Mexican government would defend itself against any group of American troops fighting within its territory. The American government did not regard this note as an ultimatum, but there was no disregard of the seriousness of the situation. Reinforcements were hurried to the border, including all the troops of the regular army available and the militia of Texas, Arizona, and New Mexico. All along the border at this time there were about 50,000 men. In Mexico there were many evidences of hostile feeling against Americans following the movement of Carranza. In Chihuahua the American consulate was attacked, and the building of the American consulate was burned in Durango.

**THE CALLING OUT OF THE NATIONAL GUARD; THE AMERICAN REPLY.** In the light of the possible developments President Wilson considered it wise to call out the entire national guard of the country, and preparations in all the States were at once begun to answer such a call. The forces on the border soon reached 100,000 men. While matters were at this crisis there were further raids on the border between Laredo and Brownsville, and a third and fourth American expedition were dispatched in pursuit of the marauders, in spite of Carranza's protest. On June 15th, over 100 Mexicans attacked the 14th infantry camp at Laredo and killed three troopers. On the following day a detachment of the 26th infantry was fired upon at West Brownsville. The troops of Carranza under Maj. Alonzo Gray were sent in pursuit and had an encounter with the bandits. General Ricaut, commanding the local Carranza forces, sent an ultimatum

threatening to attack the American troops if they did not immediately withdraw. This was disregarded and the American forces advanced two miles further, made an encampment, and sent out scouting parties. They did not, however, find the bandits, and soon returned. This incident added fuel to the anti-American feeling in North Mexico, which developed to a high tension. American consuls in several border cities left their posts and returned to the United States. At this time also came a threat to General Pershing from General Trevino, commanding Carranza's army of the north, notifying the former that any movement of the American troops from their present line to the south, west, or east, would be considered a hostile act and a signal to commence actual warfare, and that if additional troops crossed the border they would be attacked. General Pershing replied that he could not recognize General Trevino's authority to question the movement of the American expedition. The situation thus produced was of the very gravest nature for the American troops already in Mexico. This was increased by a distribution of Mexican troops in a loop around General Pershing's forces, which confirmed the suspicion that Carranza was no longer concerned about cooperating with the United States to clear his own country of the bandits, but was virtually in league with impeding the American pursuit. For a time war hung in the balance. General Pershing notified the Carranza commanders that any movement threatening his forces would be on their own responsibility.

The situation was relieved on June 20th, by Carranza's receipt of the American answer to his demands made on May 22nd. In this reply Secretary Lansing bluntly refused Carranza's request for the withdrawal of American troops from Mexican soil. He intimated, moreover, that the numbers might be reinforced, and that the American forces would remain on the border until the establishment of order, since Carranza had shown that he himself was not able to bring this about. Secretary Lansing denied most emphatically any intention of the United States to establish themselves over Mexican territory, and insisted that the expeditions hitherto made were simply for the purpose of pursuing bandits and preventing further raids across the border. He said: "The Government of the United States, if it had had designs upon the territory of Mexico, would have had no difficulty in finding, during this period of revolution and disorders, many plausible arguments for intervention in Mexican affairs. Hoping, however, that the people of Mexico would, through their own efforts, restore peace and establish an orderly government, the United States has with patience waited the consummation of the revolution." Mr. Lansing further declared that the American government had concluded that "in spite of the crimes committed and the sinister design of Villa and his forces, the Mexican government does not or did not intend or desire that these outlaws should be captured or destroyed, or dispersed by the American troops, or at the request of this government by the Mexican troops." For this reason he declared that the demand that the troops should be immediately withdrawn should not be entertained. Mr. Lansing placed any responsibility for hostility between the two nations upon the shoulders of the Mexican government.

**THE CARRIZAL AFFAIR.** While this note had been dispatched but had not been received by Carranza, there was an encounter between American and Mexican troops which was the most serious which had hitherto occurred. On June 20th two troops of the 10th cavalry under Caps. Charles D. Boyd and Lewis S. Morey made a junction at Lake Santa Domingo following a scouting expedition after Villistas. On the following morning they resumed their movements through a canyon in the direction of Carrizal, southeast of Villa Ahumada, which was the field base of the Mexican forces. Their purpose was to investigate reports that Mexicans were massing near Carrizal for the purpose of threatening American columns. Having arrived within two miles of Carrizal, the troops halted, and Captain Boyd sent his Mexican guide into the Mexican town with a request to the commander to allow the passage of his troops through the streets. The commander refused this permission, but sent another messenger saying that the troops might pass through if Captain Boyd would enter the town for a parley. The latter, however, feared an ambush. While this was being considered General Gomez, accompanied by other officers, appeared, and explained that he wished a conference with the American officers outside the town. During this conference there were suspicious movements of the Mexican troops in the town. The American soldiers observed Mexicans in considerable numbers circling around the flanks of the American troops. They noted also that machine guns were being placed in position, and trained upon them. General Gomez and the other officers suddenly withdrew from the conference, and as soon as they were out of range fire was opened from the Mexican side without any notice. The Americans numbered only 84, while the Mexicans were several hundred strong. The American troops quickly formed for an attack, and charged. At a distance of 300 yards the Mexicans opened a heavy fire, and the fight began, the Americans having the disadvantage. Firing proceeded for two hours when the Americans troopers were unable to hold longer and fell back to the west and scattered. A group of Mexicans had, in the meantime, ridden in their rear and stampeded their horses. Twenty-four Americans were captured, Captain Boyd and Lieutenant Adair were killed, and 14 troopers killed or wounded, making an American loss of 40. The survivors finally found their way back to the American field headquarters. The Mexicans lost about 40 killed and 39 wounded. Among the killed was General Gomez.

**THE AMERICAN DEMANDS.** Following this affair war seemed inevitable, and the situation was made worse by the attitude of General Carranza who sent a note to the State Department on June 24th with a confirmation of the order given to General Trevino not to permit American forces to advance further southeast or west, and to oppose new incursions of American forces into Mexican territory. In spite of this warning Carranza declared that American forces had marched eastward quite far from their base and engaged Mexican troops. Secretary Lansing at once replied to this note in a message sent through the American representative in Mexico City. He stated that the United States government could put no other construction on the note than that "It is a formal avowal

of deliberately hostile action against the forces of the United States now in Mexico, and of purpose to attack them without provocation whenever they move from their present position in pursuance of the objects for which they were sent there, notwithstanding the fact that these objects involve no unfriendly intention toward the government or people of Mexico, but are, on the contrary, intended only to assist that government in protecting itself and the territory and people of the United States against irresponsible and insurgent bands of rebel marauders."

Secretary Lansing demanded the immediate release of the prisoners taken in the encounter at Parral, together with any property of the United States taken with them. He also asked an immediate statement from the Mexican government as to the course it wished the United States to understand it had determined upon, and that this statement was to be made through the usual diplomatic channels, and not through subordinate military commanders. Following this there were some efforts of mediation on the part of Argentina, Brazil, and Chile, but to these the United States refused to listen, so long as its soldiers were imprisoned on Mexican soil. Carranza was, for a few days, defiant, but the prospect of an imminent attack by the American forces, and the constant increase of these forces along the border finally induced him reluctantly to release the prisoners, and on June 29th, having been deprived of nearly all their clothing, they passed out of the jail in Chihuahua on their way toward the border. Their passage was marked by jeers of triumph on the part of Mexicans along the way.

Carranza had, in the meantime, suppressed the publication of the American note of June 20th, until June 30th, when it appeared in the press in conjunction with a statement of his own, intended to offset the effect. Some improvement in the conditions resulted from the readjustment of the American forces in Mexico, which began immediately after the clash at Carrizal. Certain camps were evacuated, and the line was shortened. The evacuated points were promptly occupied by Mexican troops and General Trevino gave it out that the movement was a retirement northward. The new base for the American forces was 150 miles nearer the border than it had hitherto been. Carranza, in an interview given at this time, declared that he did not wish war with the United States, but rather to preserve "by all honorable means" peace with that country. He insisted that the American people did not or could not understand the Mexican point of view. This statement was an indication that he had determined upon a back-down from the warlike attitude which, up to this time, he had sustained, and this was confirmed by a note received on July 4th, which was somewhat conciliatory in its tone, and suggested mediation on the part of certain Latin-American countries to bring about a solution of the entire question. There was no further request for the withdrawal of American troops.

**THE JOINT COMMISSION.** President Wilson declined the suggestion of mediation by Latin-American republics, and in place of this brought about a conference between delegates of the Mexican and American governments. After considerable wrangling as to the scope of the deliberation of such a commission, arrangements

AMERICAN-MEXICAN JOINT COMMISSION

01

for its meeting were finally made. The American commissioners included Franklin K. Lane, Secretary of the Interior; Judge Gray, of the United States Circuit Court; and John R. Mott, International Secretary of the Young Men's Christian Association. The Mexican delegates were Luis Cabrera, Mexican Minister of Finance; Alberto Pani, President of the Mexican International Railways; and Ignacio Bonillas, of the Mexican Department of Communication. New London, Conn., was selected as the first meeting place, and sessions were begun in September, 1916.

The first formal session of the conference convened on September 6th. The Mexican delegates were welcomed by Secretary Lansing in an address in which he emphasized the duty of the conference to find a permanent solution of the internal difficulties of Mexico, as well as of the points in conflict between Mexico and the United States. Considerable progress was made during the first two weeks in laying a foundation for negotiations. The Mexican delegates showed unmistakably that their chief endeavor was to bring about the removal of the United States forces from Mexico. Señor Cabrera made to the delegates a comprehensive statement on the present situation in Mexico with the intention of proving that the *de facto* rule of Carranza was able to bring about stable conditions if he were given a free hand. President Wilson received the Mexican commissioners on board the *Mayflower*, and returned with them to their hotel, giving them assurances of his sympathy with the aims of the revolutionists in Mexico. He declared that the regeneration of that country must come from within, and impressed upon the delegates the necessity for the protection of life and property.

During the first weeks of the session of the conference there were indications in Mexico that Villa had again become active. Reports received from General Bell, commanding the American troops near Chihuahua, showed that Villa with a force numbering over 5000 men had captured a portion of the city of Chihuahua in spite of a large Carranza garrison at that place.

In the first week of October the joint conference renewed its deliberations in Atlantic City. Little progress was made toward a definite settlement up to this time. The Mexican delegates were reluctant to discuss any question but the withdrawal of the American troops, and the American conferees preferred to discuss other questions. It was announced at this time that 10,000 of the militia forces on the border would be sent home and relieved by troops from other States. Units from Maine, New York, Massachusetts, Rhode Island, Wisconsin, Connecticut, Montana, New Jersey, Utah, and the District of Columbia were notified that they would shortly return. The conference had, by this time, resolved itself into a general discussion of the entire question of the political, financial, and industrial stability of the present government in Mexico. On October 4th, the commission issued a statement as follows: "The morning session of the American and Mexican Joint Commission was devoted to the presentation to the Mexican commissioners by their American colleagues of the importance of giving consideration to certain questions which have a distinct international bearing, because of their effect on the status of the rights of foreigners

Y. B. 16—15.

resident in Mexico, and of foreigners who have invested their capital in Mexican enterprises. The position taken by the American commission is that the satisfactory solution of these questions is integral and a necessary part of a general programme, the purpose of which is to assure to Mexico the resumption of her normal position among the nations of the earth."

**RENEWED ACTIVITY OF VILLA.** Reports were received that Villa was concentrating his forces in the state of Chihuahua for an advance northward. The Mexican government made a request for financial assistance from the United States to help support the cost of the frontier patrol. Villa continued, through the latter part of October, to defeat the Carranza forces, and at Santa Ysabel, on October 20th, won a victory over them which gave him practical control of the country south and west of Chihuahua city.

**ELECTION IN MEXICO.** On October 22nd a general election took place for a new constitutional assembly to revise the organic law of the republic. Each state chose one delegate and one alternate from every 70,000 population, or each fraction of that number in excess of 20,000. Opponents of the *de facto* government were not allowed to take part in the election or become candidates. The assembly convened on the 1st of December, at Queretaro. The proposals outlined by General Carranza were reported in the American press as follows: Punishment of wrongdoings on the part of governors and other public officers; various reforms of the judiciary, including its absolute independence of the other departments of the government, and more equitable provisions for the treatment of the accused; the establishment of a minimum wage and a maximum working day; the reform of the divorce laws; the abolition of the vice-presidency; the consideration of the question whether the franchise should be universal or qualified; and the strengthening of the presidency and the central government, which was to be established by direct election. In the course of the discussion it appeared that a number of articles would be introduced on the principle of keeping Mexico for the Mexicans.

During November civil war continued to rage throughout Chihuahua. Authoritative reports from Mexico indicated that Carranza had about 175,000 men under arms, and that Villa had less than one-tenth of this number. In spite of this the latter continued to take the offensive, and he was reported to have captured the towns of Santa Rosalia and Parral, which had been abandoned by Carranza forces. Railroads in Chihuahua and other states were cut by detachments of the insurgent army, and trains from Juarez were intercepted, the passengers robbed, and soldiers who were on board the train shot. In spite of the extension of Villa's range of operation the *de facto* government showed no indication of welcoming the cooperation of the American forces. The sessions of the American-Mexican joint commission were suspended by mutual consent until after the elections of November 7th. On the eve of that election General Obregon, General Carranza, and other Mexican leaders issued interviews or statements accusing President Wilson of a lack of sincerity in pretending friendship to Mexico while permitting aid to cross the border to the insurgents and keeping an army of invasion on Mexican soil.

**THE PROTOCOL.** The joint commission met again on November 10th. After several days' deliberation the commission took a recess after reaching a tentative agreement, which was to be submitted to Carranza for his approval. The Mexican delegates obstructed the attempt of the American delegates to arrive at an agreement which would permit the sending of punitive expeditions into Mexico in case of renewed border raids. The Government of the United States insisted upon such a provision, believing that if the present army of occupation should be withdrawn and the safety of the border entrusted to garrisons of the two nations each guarding its own side of the frontier, as the Mexican delegates proposed, the Carranza forces might prove too weak to prevent attacks across the American border. The deadlock between the delegates was broken on November 24th. The protocol for agreement signed by the delegates formulated a compromise. It provided for the withdrawal of General Pershing's army from Mexican soil within 40 days after the agreement had been ratified. If new raids should occur in the meantime the operation of this provision would be suspended. Each army would patrol its own side of the border, but no special arrangement was made for establishing a neutral border zone which the armies of the other nation might use for police purposes. The United States reserved the right to send an army into Mexico to capture bandits who had invaded American territory. Further questions of claim for damages on the part of either government and plans for the sanitary and economic development of Mexico were left to future diplomatic action. After signing the agreement Secretary Lane, chief of the American members of the commission, issued a public statement in which he expressed the wish that the United States could help Mexico to become a free and prosperous nation.

**THE SITUATION AT THE CLOSE OF THE YEAR.** While the final agreement was being entered into by the members of the commission Villa was attacking the city of Chihuahua. An attack made by him on November 23rd seemed to have been repulsed with considerable loss by General Trevino. He again attacked on November 25th, and a detachment of his forces entered the city. His main force, however, remained outside and exposed to the fire of machine guns from the defenders. General Trevino, however, was unable to hold out and on November 27th began an evacuation of the city. The Federal forces made a new base for operations at Juarez.

The constitutional convention assembled in the city of Mexico on December 1st. General Carranza laid before the delegates the programme of projected reforms, including legislation for reforming the judiciary and measures on behalf of labor. The new constitution was to follow in general the outlines of the existing constitution established in 1857 by Juarez, the leader of American liberalism in the nineteenth century.

On December 3rd, the Carranza forces under Generals Ozuna and Murguia reentered Chihuahua city which Villa had previously evacuated. Before leaving the city his army burned and plundered shops and massacred many of the foreign residents, especially the Chinese. The report that several Americans were killed was denied. By the capture and temporary holding of the city Villa was able to acquire large amounts of ammunition and supplies. He was

said at this time to have commanded a force of about 10,000 men, and he was abundantly supplied with machine guns and small cannon, which he had taken from the Carranza forces. Villa next attacked the city of Torreon, and captured it on December 22nd. Two days later, San Luis Potosi, east of Torreon, fell into his hands. Villa's objective was believed to be Tampico, to the east of San Luis Potosi, on the line of the National Railroad, with the object of obtaining a port through which he might receive supplies.

The protocol signed by the American and Mexican commissioners was presented to General Carranza by Alberto Pani, one of the Mexican representatives. While he is said to have approved of it in principle he refused to sign it until the modification of some of its terms had been made. The American members of the commission informed the Mexican delegates on December 19th that they would insist on the protocol as signed three weeks previously and that no modification would be made. They refused to enter into any discussion of the matters relating to the proposed agreement until General Carranza stated definitely whether he would endorse the action which had been taken by his representatives. The commission then adjourned, awaiting a reply from Carranza. On December 28th, a message from Carranza was delivered to Secretary Lane. This was in reply to the American demand that the protocol be ratified. The message was an 800 word document, in which Carranza failed to consent to the American demands, but refrained from including anything that could be construed as a refusal. No action had been taken by the commission on this document at the close of the year.

In the operations against Villa, the American expedition to Mexico took no active part, and indications at the end of the year were, that it would shortly be withdrawn from Mexican territory.

**MIAMI FLOOD PREVENTION.** See FLOODS.

**MIAMI UNIVERSITY.** A co-educational State institution founded at Oxford, Ohio, in 1809. In the autumn of 1916 the students numbered 873 and the faculty 58. The productive funds of the university amounted to \$360,006 and the total income for 1916 was \$360,006. The library contains 46,808 volumes. President, Raymond Mollyneux Hughes.

**MICHIGAN. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 3,074,560. The population in 1910 was 2,810,173.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16, were as follows:

		Acreage	Prod. Bu.	Value
Corn	1916	1,655,000	43,375,000	\$43,108,000
	1915	1,750,000	56,000,000	38,080,000
Wheat	1916	800,000	13,800,000	22,712,000
	1915	960,000	20,448,000	20,652,000
Oats	1916	1,423,000	42,690,000	22,626,000
	1915	1,530,000	64,260,000	22,491,000
Potatoes	1916	320,000	15,360,000	24,576,000
	1915	355,000	20,945,000	11,729,000
Hay	1916	2,750,000	a 4,372,000	43,720,000
	1915	2,470,000	3,458,000	42,188,000

a Tons.

	Acres	Prod. Bu.	Value
Rye ..... 1916	325,000	4,648,000	6,042,000
..... 1915	350,000	5,425,000	4,611,000
Barley ... 1916	100,000	2,450,000	2,280,000
..... 1915	85,000	2,508,000	1,555,000

**MINERAL PRODUCTION.** The mines of the State produced in 1915 265,253,370 pounds of copper, valued at \$46,424,591. In connection with this there were produced 585,933 fine ounces of silver, valued at \$297,068. The total value in copper and silver was \$46,721,659. This was an increase of \$24,635,235, or about 112 per cent in value over the production, in 1914. At the beginning of the year the production of copper was somewhat below the normal, but soon increased demand and improved prices caused an increase in production and from that time or until the end of the year mines and reduction

taken in 1914 showed a consistent increase as compared with that in 1909, with the exception of a slight decrease in the number of establishments and proprietors. The capital invested in industries in the State in 1914 amounted to \$869,043,000, or an increase of 48.8 per cent over the capital invested in 1909. The value of the production was \$1,086,162,000 in 1914, compared with \$685,109,000 in 1909, or an increase of 58.5 per cent. Salaries and wages paid out during 1914 amounted to \$250,525,000, compared with \$153,838,000 in 1909, or an increase of 62.8 per cent. The average number of wage earners in 1914 was 271,090, compared with 231,499 in 1909, or an increase of 17.1 per cent. The most important facts in relation to this census for 1914 compared with 1909 are shown in the following table:

	1914	1909	Per cent. of increase, 1909-1914 *
Number of establishments .....	8,724	9,159	-4.7
Persons engaged in manufactures .....	320,811	271,071	18.3
Proprietors and firm members .....	7,725	8,965	-13.8
Salaried employes .....	41,796	80,607	86.6
Wage earners (average number employed during the year) .....	271,090	231,499	17.1
Wage earners, by months:			
January .....	278,087	211,679	....
February .....	277,824	218,230	....

\* A minus sign (--) denotes decrease.

plants turned out copper as rapidly as possible. The average price of copper per pound in 1915 was \$0.175, compared with \$0.133 in 1914. The smelter production or the output of refined copper in 1915 was 236,757,062 pounds, compared with 158,009,748 pounds in 1914. The entire output of the copper is from the Keweenaw district.

The coal production in the State in 1915 was 1,156,138 short tons, valued at \$2,372,797, compared with 1,283,030 tons, valued at \$2,559,786, in 1914. In 1916 it was estimated at 1,230,000 tons. The average price per ton in 1915 was \$2.05, six cents greater than in 1914. There were employed in the coal mines of the State during the year 2569 men.

Michigan ranks second in the production of iron ore, being surpassed only by Minnesota. The total production in 1915 was 12,544,516 gross tons compared with a production in 1914 of 10,796,200 tons. There were shipped from the mines of the State in 1915 13,664,437 tons, valued at \$28,218,627, compared with 8,533,280 tons, valued at \$18,722,358, in 1914, an increase in quantity of over 60 per cent, and of over 50 per cent in value.

**MANUFACTURERS.** The census of manufactures

**TRANSPORTATION.** The mileage of single track of railways in the State on June 30, 1914, was 8898. There has been practically no construction since that date.

**EDUCATION.** The total number of school children between the ages of 5 and 21 in the State in 1914-15 was 845,754. The enrollment was 623,087. The teachers numbered 20,161, to whom were paid a total of \$11,932,392. The average monthly salary of men teachers was \$95.27, and of women \$59.95. The total net expenditure for schools during the year was \$22,384,232.

**FINANCE.** The report of the State Treasurer for the fiscal year 1916 showed a balance on July 1, 1915, of \$5,576,074. The receipts for the year amounted to \$20,929,261, and the disbursements to \$17,927,106, leaving a balance on hand June 30, 1916, of \$12,578,230.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the Pontiac State Hospital, Kalamazoo State Hospital, the Traverse State Hospital, the Newbury State Hospital, Ionia State Hospital, State Psychopathic Hospital, the Michigan Home and Training School, Michigan Colony Farm for Epileptics at Wahjamega, Michigan State Prison

at Jackson, State House of Correction and Branch Prison at Marquette, the Michigan Reformatory at Ionia, the Industrial School for Boys at Lansing, the State Industrial School for Girls at Adrian, the State Public School at Coldwater, Michigan School for the Blind at Lansing, the Michigan State School for the Employment of the Blind at Saginaw, Michigan School for the Deaf at Flint, Michigan Soldiers' Home at Grand Rapids, the Michigan State Sanatorium for Tuberculosis at Howell. The total number of inmates in these institutions in 1916 was 13,193.

**POLITICS AND GOVERNMENT.** The political campaign opened in the State with a presidential primary held on April 3rd. Henry Ford of Detroit, although he gave notice that he was not a candidate, received 83,057 votes for the Republican nomination to 77,822 for United States Senator William Alden Smith. The Republican delegates to the national convention voted for Mr. Ford on the first ballot in accordance with the mandate of the primary, and then swung to Mr. Hughes. The Democratic presidential primary vote was 84,972 for Wilson, with 248 scattering.

At the State primaries, which were held on August 29th, Albert E. Sleeper won the Republican nomination for Governor. Lauren D. Dickinson was renominated for Lieutenant-Governor, and Charles E. Townsend was renominated for United States Senator. The candidates nominated for Governor, Lieutenant-Governor, and United States Senator all declined to run, so that the State central committee filled the vacancy by naming E. Sweet for Governor, John Smith for Lieutenant-Governor, and Lawrence Pierce for United States Senator.

On the election of Nov. 7, 1916, Justice Charles E. Hughes carried the plurality of the State by 52,322. The highest vote of any Republican presidential elector was 339,097, while the largest polled by any Democratic elector was 286,775. Benson, the Socialist candidate, received 16,126; Hanly, Prohibitionist, 8136; and Reimer, 842. Albert E. Sleeper, Republican, was elected Governor over Edwin F. Sweet by a plurality of 99,284. Dickinson, Republican, was elected Lieutenant-Governor, and Charles E. Townsend was re-elected Senator. The rest of the Republican ticket was also elected. The Republicans carried 12 of the 13 Congressional districts, and a large majority of the Legislature.

A constitutional amendment for State-wide prohibition was introduced, and adopted by a vote of 353,378 for, to 284,754 against. The amendment becomes operative on May 1, 1918.

**STATE OFFICERS.** Governor, Albert E. Sleeper, Rep.; Lieutenant-Governor, Lauren D. Dickinson, Rep.; Secretary of State, Coleman C. Vaughan, Rep.; Treasurer, Samuel Odell, Rep.; Auditor, Oramel B. Fuller, Adjutant-General, John S. Bersey, appointed by State Military Board; Attorney-General, Alexander J. Groesbeck, Rep.; Superintendent of Education, Frederick L. Keeler, Rep.; Commissioner of Insurance, John T. Winship, Dem.

**JUDICIARY.** Supreme Court: Chief Justice, Franz C. Kuhn; Associate Justices, John W. Stone, Russell C. Ostrander, John E. Bird, Joseph B. Moore, Joseph H. Steere, Grant Fellows, Flavius L. Brooke; Clerk, Charles C. Hopkins.

**MICHIGAN, UNIVERSITY OF.** A co-educational State institution founded at Ann Arbor, Mich., in 1837. On Nov. 1, 1916, there were 6276 students enrolled. Including the summer session of 1916, it was estimated that the total registration for 1916-17 would be 7521. The number of members in the faculty was 600, including staff lecturers, demonstrators, and the more important administrative officials. Dr. Mellis B. Foster succeeded Dr. Hewlett as head of the department of internal medicine in the Medical School. Dr. Marcus L. Ward became dean of the Dental College, succeeding Dr. Hoff. The dental course was lengthened to four years. During the year several loan funds and scholarships of \$10,000 or less were established. The university has in productive funds the proceeds of Federal land grant sales, amounting to \$547,306, and gifts totaling \$465,984. The library contains 368,238 volumes. President, Harry Burns Hutchins.

**MILITARY AERONAUTICS.** See AERONAUTICS; MILITARY PROGRESS; WAR OF THE NATIONS.

**MILITARY PROGRESS.** The great features of the war in Europe in 1916 were still the importance of machine guns, the indispensability of heavy artillery, and the efficacy of aviation. Of still greater importance, perhaps, as affecting the entire conduct of operations, stood out the need of mobilization of industries. The whole nation was at war, whether on the lines in actual strife, or behind them in making strife possible. Recalling the fact that warfare on the greater fronts had become a matter of siege conditions, varied, from time to time, by tremendous efforts to win a decision by breaking through, it will also be well to recollect that the ordinary names that used to have a meaning in respect to the battlefield, had ceased practically to have any meaning at all. Thus, although we still may speak of *lines*, what we really mean is an *area*; in elder days, to break through at a given point, meant, all other things equal, defeat for the broken side, but to-day "points" have ceased to exist. An enemy may still be beaten by breaking through; but the gap must be miles wide and miles deep. This state of affairs is due, as every one knows, to the grip on the ground formed by the development of trench work; so great is this development, that the original single trench, so hard to capture, for example, in the American Civil War, had given way to an elaborate network of trenches, dug down in many cases yards below the surface of the ground.

But trenches alone could not, under modern conditions, effectually keep out a determined enemy; it was the trench faced, so to say, with barbed wire that had succeeded in bringing about this result. Even so, however, a wire trench was, after all, only a passive obstacle; and since

all passive obstacles, undefended, must eventually break down under suitable attack, the trench was quickened, as it were, by the employment of machine guns in vast numbers; it was reported that for every 30 yards of front a machine gun was furnished. We must, therefore, imagine attacking infantry, for this arm was still the Queen of Battles, as affronting an area intersected by trenches laced with wire, and actively defended by machine guns suitably emplaced to sweep the zone of attack. Machine guns alone could be put out of action, wired trenches alone could be overcome, but the combination of trench and wire was of itself substantially impenetrable. Hence, to sweep over the area held by the enemy, and to advance through his "lines" to the open country beyond, trenches, entanglements, and machine guns must all first be swept out of existence. To accomplish this result, recourse must be had to artillery fire of an intensity that calls for large calibres, and for numberless projectiles filled with high explosive charges. To illustrate, it was stated that in order to "put out" a single battery, an area of 20,000 to 30,000 square meters must be covered with an expenditure of from 8000 to 10,000 shell. Again, one French battery, north of Arras, fired in 24 hours more projectiles than the entire German artillery in the war of 1870-71. Only by such fire may the trenches be leveled, the entanglements broken up, and the machine guns destroyed. Under the best conditions, however, after the most deliberate preparation followed by the most scrupulous application of the teachings of experience, the effort to break through so far had failed. Not all the wire had been broken up, a few machine guns might have escaped destruction: it followed that a portion of the attack was literally mechanically held back, or found itself exposed to machine gun fire in flank or in rear, to which no answer could be made; a few machine guns might check an entire division (20,000 men). But these checks were local: the attack, costly as it proved to be, was successful in that it carried three, four, or more "lines" of trenches. The enemy position was dented, or, as the newspapers were so fond of saying, a "salient" had been pushed forward. If the process could be indefinitely kept up, its final success could not be prevented, but as this process depended upon the artillery fire mentioned, evidently guns must be pushed up from the rear to take under fire fresh areas of the enemy position, and so prepare them for fresh assaults by infantry. But obviously time and labor were needed to advance the batteries; it was no longer a question of limbering up the small field-piece and advancing to new positions whence a shaken enemy may again be battered. The guns that told were guns of position; their transport, with that of the colossal supplies of munitions needed, called for much effort, and this even if the infantry to carry on the new assaults were at hand and ready. Costly and apparently negative though these operations had so far been, no other solution had suggested itself, and a regular procedure seemed to have established itself; artillery preparation and the attack proper, followed, if successful, by consolidation and extension of the position won.

The attacking lines were protected from counter attack by curtain fire, *tir de barrage*, or drum fire, in which the pieces assigned to this

duty, firing over and on the flanks of their own troops, surrounded them, as it were, by a ring of fire through which the enemy was unable to pass, and thus gave their own people time to assure themselves in the position captured. In this curtain fire, asphyxiating shells were used. If this position projected sufficiently into the enemy zone, a reverse enemy "salient" was necessarily formed. Attempts on the sides of this salient might drive in the enemy so far that his communications with it would be exposed. When this was the case, he must either recapture the lost ground, or abandon his salient, as occurred during the battle of the Somme. What may be called a "false front" showed its usefulness, as for example, at Verdun. This false front consists merely in a position or line far to the front, and but thinly occupied. "It enables a defender to save his men, by not having to put masses of infantry from the very beginning into the danger zone throughout the terrific bombardment of modern warfare," and exacts from the attack an expenditure of time, men, and munitions out of all proportion to the results obtained by its capture.

In the battle of the Somme, Sept. 15, 1916, the so-called "tank" made its first appearance, being used by the British in their attack. This new engine of war was an armored motor car, a caterpillar tractor, of 60-70 horse power, able to make its way across shell-craters and trenches, and over and through considerable standing obstacles, such as walls, small trees, or houses. Proof against machine gun fire and rifle fire, these tanks, carrying three machine guns in a sponson on each side, were valuable in "cleaning out" trenches not completely disposed of by the artillery preparation or the infantry advance. The British were reported as having bought 1000 of these caterpillar tractors in America from the Holt Manufacturing Company of Peoria, Ill.

The experience of the war tended to establish the belief that in future wars, armies would require, first, heavy corps artillery, firing projectiles weighing from 15 to 40 kilograms; next, heavy army artillery, firing projectiles weighing 100 kilograms; and lastly, siege artillery, 28 to 42 centimeters in calibre. It was reported that the Krupps had developed a 54-centimeter piece with a range of 38 miles.

In the domain of aeronautics, the Zeppelin on land added nothing to its reputation; it was still a disappointment to its friends. But it was reported to be of service to the Germans in the naval battle of Jutland. The airplane, however, continued to prove its worth, in all the respects touched upon in previous YEAR BOOKS. Four types may be said to have been fixed, as conditioned by the class of duties required. These were scouting, artillery observation, destruction, and combat (against other airplanes). Expeditions in numbers, exceptional at the outbreak of the war, became, under certain conditions, normal. Their special targets were railways and railway stations, bridges and even trains, at rest or in motion; more than once, the transport of troops was definitely impeded by these organized attacks upon points of strategic importance. The airplane had even attacked troops in the field. Operations of the sort indicated had passed into the commonplace. Upon the question of size, authorities differ: since the weight of the

load to be carried increases more rapidly than the supporting surface, some maintained that a limit was imposed where increase of size would cease to be useful, but this was denied by others. Only experience will tell. Anti-aircraft artillery had so increased in efficiency that airplanes sought safety at an altitude of 3500 meters (11,500 feet). The biplane was recognized as superior to the monoplane in the military service. See AERONAUTICS.

Cinematographic sections were reported as existing in some armies, principally in the German, for the purpose of obtaining a living record of operations, even of battles. See MOVING PICTURES.

#### UNITED STATES

**TROOPS.** A condition of peace and anxiety prevailed during the year. An expedition of 10,000 men under General Pershing entered Mexico in March, 1916, in pursuit of Villa, and was still in Mexico at the end of the year, without having caught Villa. (See articles MEXICO; and MILITIA.) It was found necessary to occupy the border in greater force than ever. On Aug. 31, 1916, the troops in the southern department consisted of 2160 officers and 45,873 men of the regular army, and 5446 officers and 105,080 men of the national guard, making a total of nearly 160,000. The year 1916 was marked by the awakening of the country to its defenseless condition. To some, this realization spelt militarism, with the implication that militarism in the United States would prove to be the same thing that it had shown itself to be in Germany. But as to others it was clear that German militarism was merely the means of obtaining the ends of German ambition, and was thus nothing but the outward manifestation of a disease far more deeply seated, so the American public generally refused apparently to be blinded by the misapplication of this term, and the country seemed resolved to set its house in order. The national interest in the question was manifested in the press, in the considerable increase of the number of books devoted to the matter, and finally in the calm popular acceptance of the principle of universal compulsory military training. Ten years previously the enunciation of this principle would have brought on a storm of protest.

Obviously all action in respect of preparedness was dependent on Congress. The unwillingness of that body and of others to consent to the plan recommended by Mr. Garrison, the Secretary of War, led to the resignation of that officer in February. On June 3rd was approved an act "For making further and more effectual provision for the national defense, and for other purposes," commonly known as the National Defense Act. It is impossible within the limits of this article to discuss all the features of this act; we can do no more than to touch more or less briefly on its more significant portions.

The army of the United States was defined to "consist of the regular army, the volunteer army, the officers' reserve corps, the enlisted reserve corps, the national guard while in the service of the United States, and such other land forces as are now, or may hereafter be, authorized by law."

(a) *The Regular Army.* This element of the national forces was increased, the infantry by 34½ regiments, the cavalry by 10, the field ar-

tillery by 15, the coast artillery corps by 93 companies. The engineers, for the first time in United States military history, received a proper organization within the regular army, as troops auxiliary to the other arms, consisting of 7 regiments and 2 mounted battalions. The necessary auxiliary troops in the medical department, the quartermaster corps, signal corps, etc., were provided; and in addition such increase in the number of Philippine scouts, not to exceed a maximum of 12,000, as might be determined by the President. The number of general officers was increased from 7 major- and 17 brigadier-generals to 11 major- and 36 brigadier-generals respectively. The general staff corps was increased from 38 to 57 officers. Suitable increases were made in the adjutant-general's, the inspector-general's, the judge-advocate's, the medical and the ordnance departments, in the quartermaster, engineer, and signal corps, to meet the requirements of the increased size of the regular army.

This increase of the regular army was not to take place at once, but was to be made in five annual increments, beginning July 1, 1916, and closing July 1, 1920. The President was authorized to make the increase more rapidly should emergency call for it. The result of the increase of the regular army when completed, would be to add 6420 officers at a minimum, 7000 at maximum strength, 142,000 enlisted men at minimum, and 170,000 at maximum strength. The peace strength of the regular army was fixed by the National Defense Act at approximately 11,450 officers (counting those of the Philippine scouts), and not to exceed 175,000 troops of the line (including the ordnance department). To these must be added 42,750 non-combatant troops, and 5700 Philippine scouts, making a total of about 224,000 men. At war strength, the number of officers under the act would be about 12,000, and the enlisted strength 298,000.

(b) *Officers' Reserve Corps.* No provision was enacted with respect to the volunteer army, as that element of the national defense was to be called into existence only in time of war. But when so called, its great need, and more generally yet, the great need of the country, would be for officers, in not only the volunteers but in the regular army or any other troops that might be raised. An attempt to meet this need was made by providing for an officers' reserve corps, in which civilians might be commissioned up to and including the grade of major in the various arms of the service. The commissions of all officers of the reserve corps were to be in force for a period of five years only, but officers may be recommissioned. "These men," to quote the Secretary of War, "can be selected and trained in time of peace, and the officers so obtained will be far better prepared than any volunteers that could be raised hurriedly at the outbreak of war. In order to obtain these reserve officers, a reserve officers' training corps is authorized which will consist of units at the various colleges, academies, and universities throughout the country, where military education and training will be given, which in connection with six weeks' field training each summer, will give a personnel for the officers' reserve corps that is far better equipped for the duties of an officer than any heretofore available."

WATCHING FOR AÉROPLANES

THE ANTI-AIRCRAFT DEFENCE OF THE FRENCH LINES

(c) *Enlisted Reserve Corps.* A reserve was also created for the purpose of securing men for military service with the engineer, signal, and quartermaster corps, and the ordnance and medical departments of the army, and thus supply deficiencies in railway operatives, bridge builders, nurses, telegraphers, etc.

(d) *National Guard.* The militia was defined as consisting of the national guard, the naval militia, and the unorganized militia. Enlistment in the national guard was to be for six years, the last three in the national guard reserve, created by this act. The significant point, however, of legislation dealing with this organization, was the requirement of a Federal enlistment contract; officers and men were required to take a Federal oath. These obligations, combined with the pay provided for the national guard (under a different act of Congress from the one under discussion), constitute the so-called "federalization" of this element of the national defense. It is to be remarked that an officer or enlisted man of the national guard, in his oath, swears that he will "obey the orders of the President of the United States and of the Governor of the State of —"; upon this feature comment is unnecessary.

The experiment of using the national guard in the United States service was made, and on a large scale, during 1916. Conditions on the border were such that the President, on May 9th, issued a call, through the governors of Arizona, New Mexico, and Texas, directing the concentration of the militia of those States at points to be designated. Later in the year, on June 18th, the President called into the service of the United States a large part of the organized militia, and national guard of the States of the Union and the District of Columbia. As this second call was subsequent to the date, June 3rd, of the approval of the national defense act, it was plain that the militia units concerned were taken into the Federal service while in a state of transition to national guard as defined by the act. From the point of view of national defense, however, internal difficulties of administration, temporary and local, did not constitute the points on which the country's attention was fixed. The first of these was that this great country did not have enough regular troops to protect and police its own border against, not a powerful and well-organized enemy, but bandits and irregulars. The next point was that the duty in hand, as it was national in character, should have devolved upon national troops, or at any rate should have been equitably shared; and as the regulars—national troops—were too few, that measures should be adopted to meet not only such an emergency as was presented on the border, but more generally any other emergency. The national guard, although "federalized" by the national defense act, is made up of volunteers; i. e., there is no obligation to enlist any more than there is in the regular army. Hence, the result of the experiment on the border was apparently that important national service, forming a burden that should fall equally on all, was in reality performed by a few citizens at the sacrifice of business, professions, and family. The injustice of such methods of safeguarding the nation was self-evident. National guard officers resigned by hundreds, and discharges were sought by the men.

The effect of the experiment was to strengthen the growing conviction of the country that in universal obligatory service lies the remedy to be applied.

**MATERIAL DEVELOPMENT.** The war in Europe had opened American eyes to the fact that an army or navy unprovided with aerial equipment and personnel, was beaten in advance; that wars were fought out as much by the people behind the front as by the men on the actual firing line; in other words, that resources must be mobilized as well as men. Conscious note was also taken of the fact that the United States in 1916 had no source of nitrogen under its control, but was dependent upon the importation from abroad for this indispensable element. The Congress took preliminary steps to correct these glaring deficiencies of national economy. In respect of aeronautics, it increased the appropriation of the previous fiscal year from \$300,000 to over \$14,000,000 for the year ending June 30, 1917, and enlarged the commissioned and enlisted personnel of the aviation section. It further created the grade of aviator, in case it should prove impracticable to obtain from the army officers suitable for the aviation section, and provided that aviators should be selected from especially qualified civilians. The development of the aviation section contemplated 7 aero squadrons for the regular army, 12 for the national guard, and 5 for the defenses of both coasts. To these must be added balloon units. Further, the aeroplane industry was investigated by a technical board in order to learn the productive capacity of the manufacturers of the United States. Aeroplane equipment was developed, including bombs, bomb-dropping sights, cameras, machine-gun mounts, etc., etc. One bomb developed in the United States, the Barlow, was said to be superior to any other so far made, either in America or Europe. Its charge consisted of trinitrotoluol, and it carried, besides, an asphyxiating gas. Orders were placed or proposals invited for 419 airplanes; 5 captive balloons for field artillery were ordered. Schools were established at Mineola, Long Island, and at Chicago, Ill., in addition to that previously in existence at San Diego, Cal.

Under the law, the President in time of war was authorized to place orders for ammunition, arms, munitions generally, with any firm or corporation engaged in the manufacture of these supplies, and these orders should take precedence of all private orders. Should a firm or corporation refuse to give this precedence, or to accept these orders, the President was authorized to take immediate possession of the recalcitrant plant or plants, and to manufacture the munitions in question through the ordnance department. A failure to obey the law was constituted a felony, punishable by imprisonment for not more than three years, and by a fine not exceeding \$50,000.

The Congress further authorized the appointment of a board to investigate, and to report to Congress upon, the advisability of exclusive government manufacture of war materials. The Secretary of War was directed to make, or cause to be made, a list of all privately owned plants in the United States equipped to manufacture arms or ammunition or the component parts thereof, and the President was authorized to appoint a board on mobil-

ization of industries essential to military preparedness.

These material contributions to the development of the national defense were emphasized by the appropriation of \$20,000,000 for the establishment of a nitrate plant. A council of national defense was created, composed of the Secretaries of War, the Navy, the Interior, Agriculture, Commerce, and Labor, under whom, and by whose nomination, the President was authorized to appoint an advisory commission of seven citizens qualified by the possession of special knowledge of the resources of the country. This council was expected to coordinate the military, industrial, and commercial resources of the country, and by "rational, just, and timely provisions made in advance of trouble," to prevent "the confusion, delay, and loss due to haste in a moment of national danger."

Turning now to matters of lesser range, the number of cadets at the United States Military Academy, West Point, was increased to 1332, the increase to be made in four annual increments; soldiers were given opportunities, in addition to military training, of receiving instruction along such lines as would, without diminishing their military efficiency, enable them to return to civil life better equipped for industrial, commercial, and general business occupations. This "vocational" training had already in 1915 been begun in the coast artillery corps. Examinations to determine the fitness of officers for promotion were extended to include examination for promotion to all grades below that of brigadier-general. A revision of the Articles of War was enacted into law and given to the army, and a revision and codification of all the military laws of the country ordered. The list of detached officers was increased by 822 extra officers of cavalry, field artillery, coast artillery, and infantry. Legislation affecting the general staff corps, and particularly the relations of the chief of staff to the various War Department bureaus, was interpreted by the Secretary of War as still leaving the coordination and supervision of these bureaus in the hands of the chief of staff. Fourteen training camps were held in the Eastern department, with a total attendance of 12,200 men and boys; two in the Western department, and one at San Antonio. This mode of training was recognized by Congress in the National Defense Act: "Especial attention was given during the fiscal year 1916 to the establishment of a closer cooperation between the quartermaster corps and the various transportation interests with a view to coordination in the movements and supplies for the army." The value of this cooperation was manifest in the concentration of troops on the border. The use of motor vehicles increased the efficiency of the border patrol, and made possible a regular supply service for General Pershing. The experience thus acquired was valuable in determining the type best suited to American conditions.

In recognition of the overwhelming importance of machine guns in modern warfare, the Congress appropriated \$12,000,000 for the purchase of these weapons. A board was later appointed by the War Department to investigate the machine gun question in all of its phases, and to advise the Department on the expendi-

ture of the \$12,000,000 appropriated. This board made a preliminary report, selecting the Vickers-Maxim type for heavy machine guns, and fixing a date (May, 1917) to determine by test the comparative merits of the light type. Other changes and improvements merely can be mentioned. The automatic pistol, calibre 45, was issued to all branches of the regular army, and to most of the national guard. The Ordnance Department was making experiments to determine the most suitable type of steel helmet, plastron, and shield for use in the service. An armor-piercing bullet was developed at the Frankford arsenal. Congress appropriated \$500,000 for a new army powder factory. The tests of the 3-inch gun and split-trail carriage with approximately 45 degrees traverse of the gun on the carriage, 50 degrees elevation, etc., were carried to the point where manufacture in quantity had been undertaken. A railway mount for 4.7-inch howitzer and machine guns was designed and manufactured. Projects were developed for 3.8-inch and 6-inch howitzers, more powerful than the present pieces of the same calibre. These new pieces are for field use, and will have a long range—10,000 or 11,000 yards. Similarly, 9.5-inch and 12-inch howitzers, on field carriages, were designed, intended to accompany armies in the field. A new 16-inch howitzer would fire a projectile of 1660 pounds, with a muzzle velocity of 1900 foot seconds, propelled by a charge of 240 pounds. Some of these 16-inch howitzers—or rather howitzers and mortars combined—were to be permanently mounted on railway cars and then form part of the movable sea coast defense. New designs for the 16-inch gun gave to a projectile of 2400 pounds a muzzle velocity of 2600-2700 foot seconds, with a charge of 900 pounds. The 16-inch disappearing carriage was undergoing test at Sandy Hook.

Single section, core-igniter charges were used during the year in target practice with major calibre guns, instead of multiple section charges. Marked improvement in uniformity of velocities and pressures was reported in consequence. Some experience was gained with armored motor cars, of which four were constructed; two of these each had two revolving turrets, and weighed 11,500 pounds apiece. The other two had single turrets, and weighed only 8500 pounds. A special armored car, really a sort of blockhouse on wheels, was made for and tested by the corps of engineers. Its weight was 86,000 pounds, length 47 feet, width 9 feet 1.5 inches. The armament consisted of a field piece in the centre, and machine guns. The appropriation for this class of equipment, made in the army act of Aug. 28, 1916, was \$500,000.

In the coast artillery, the effect of legislation was to give a complete manning detail for gun and mine defenses abroad, and for one-half of the gun, and all of the mine, defenses at home. The companies of the arm no longer are numbered consecutively through the arm; each defense has now its own series of numbers. The strength of the company is variable, according to the duty to be performed. A most interesting test was made in March at Fort Morgan, Ala., when the battleships *New York* and *Arkansas* fired their 12-inch and 14-inch guns at a modern emplacement to deter-

The armored travelling battery illustrated has been disabled, but the photograph, which shows the front end, indicates the character and construction of these modern engines of war  
A BRITISH "TANK" AS USED ON THE WESTERN BATTLE FRONT

mine the effect upon the emplacement itself, upon the guns behind it, the ammunition in the magazine, the personnel manning the emplacement, and finally the accessories, e.g. telephones, sights, range-finders. The question of probability of hitting was also to be considered. Valuable information was obtained, but not published. Appropriations made (Fortification Act) at last permitted the fortifications at Cape Henry to be begun, and allotted \$6,500,000 for sea coast ammunition at home, and \$2,200,000 for the insular possessions. This act also provided for the purchase of the patent rights and the installation of a type unit of the Hammond radio-dynamic torpedo, provided that a joint board of army and navy officers reported favorably upon the device. The question of the movable artillery defenses of our sea coast, intended to protect undefended, and to prevent landing at unfortified, points, came up as involving a necessity to dwell with in the future. See UNITED STATES, *Army*.

The record of the medical corps deserves notice; there were during the year only eight cases of typhoid fever, with no deaths therefrom. The malaria and tuberculosis rates were the lowest ever known in the army.

**Bibliography.** The report of the Secretary of War for 1916, and reports generally of the Chiefs of Bureau, War Department, and the National Defense Act should be consulted for details of organization, as should the Appropriation acts. For military questions both abroad and in the United States, see the *International Military Digest*, 1916, *passim*.

**MILITARY TERRITORY OF THE NIGER.** A territory belonging to the government-general of French West Africa (q.v.). A commandant administers the government under control of the lieutenant-governor for Upper Senegal and Niger. Zinder was made the capital when the military territory was reorganized.

**MILITARY TRAINING IN SCHOOLS.** See EDUCATION IN THE UNITED STATES.

**MILITIA.** It was a notable year in the history of the militia and national guard of the United States. The act on June 3, 1916, which is commented on in greater detail in the section *Army*, article UNITED STATES, made important and far-reaching changes in the organization of the national guard. It gave the national government the requisite authority to prescribe the particular units as to plans or arm of service to be maintained in order to secure a force, which when combined, should form complete higher tactical units. Prior to June 18, 1916, the total reported strength of the militia and national guard was 8595 commissioned officers, and 123,605 enlisted men. Of this force 1451 officers and 6131 enlisted men belonged to the staff and non-combatant branches, 456 officers and 8084 enlisted men belonged to the coast artillery, and 6682 officers and 109,390 enlisted men belonged to the infantry and field artillery, cavalry, and infantry. The organizations called to the service of the United States on May 9, 1916, and June 18, 1916, include 108 regiments and 7 separate battalions of infantry; 3 regiments, 13 separate squadrons, and 22 separate troops of cavalry; 6 regiments, 12 separate battalions, and 12 separate batteries of field artillery; 3 battalions and 11 separate companies of engineers; 4 battalions, 16 separate companies of signal

corps; 1 aëro company, 23 ambulance companies, and 37 field hospitals. On July 31, 1916, there were on the border 110,957 troops, and in State mobilization camps 40,139, aggregating 151,096. The aggregate strength was short of the authorized peace strength 4083, and short of war strength 97,350. Forty-four officers of the regular army were commissioned in the national guard in the service of the United States.

Organizations of the militia and national guard of the States of Arizona, New Mexico, and Texas were called into the service of the United States on May 9, 1916. These were the first State troops employed in such service. On June 18th, the entire organized militia and national guard of all the other States were called into the service, and directed to assemble at their State mobilization camps. The removal from the rendezvous to other State camps was under the control of the State authorities, and from these camps to the stations designated on the border under the direction of the War Department. These troops began their mobilization campaign on June 27th, and on July 1st, there were on the way to the border 122 troop trains carrying over 2000 passenger and baggage cars, with a total strength of 36,042 men. Four days later 101 troop trains were on the way to the border, and up to July 31st, 112,000 militia troops were transported to the border. The task imposed on the railroads of the country involved 350 trains to carry the first 100,000 men. Over 3000 passenger cars were provided and in addition about 400 baggage cars, most of which were equipped as kitchen cars for serving hot meals, 1300 box cars, 200 stock cars, and 80 pack cars. All railroads gave preference to troops over other travelers. The distance traveled by the troops was from 600 to 3000 miles, the majority of these troops being carried over 2000 miles.

The State troops were stationed at various points along the border, the most important headquarters being McAllen, Pharr, and Laredo. Although they saw no active service, the duties performed by them were sufficiently difficult to put their physical stamina to the severest test. They were given long marches, and although in most cases the troops stood the test well, certain organizations did not show the state of preparedness which would be satisfactory under real military conditions.

The maintenance of these troops on the border was accompanied by severe criticism both as to the policy of keeping them there, and in regard to the methods of sanitation and feeding while they were in camp. In answer to a widespread demand Congress appropriated \$2,000,000 for the support of families of such of the State troops who were dependent. There were many cases of individual hardship, but in cases where sufficiently good excuses could be furnished men were discharged, and allowed to return to their homes. The mobilization of the national guard presented to the medical staff of the army a large and delicate problem. The men comprising the regiments were drawn from all parts of the country, and were transported at the height of the summer heat to the climate of southern Texas, to which few, if any, of them were in the least accustomed. All of the facilities of the health service of the army were at once devoted to sanitary meas-

ures for the safety of the men. In spite of criticism the sick rate of the combined forces on the border during the mobilization was less than 2 per cent. This is equivalent to an effective rate of 18 per thousand.

During the last two months of the year withdrawals of these troops were begun, and by the end of the year there remained on the border about 100,000 troops.

Several of the States made provision for voting for the troops at the national election. The following table gives the strength of the organized militia at the end of the fiscal year 1915:

State, Territory, or District.	1916	
	Officers	Enlisted men
Alabama	166	2,391
Arizona	54	866
Arkansas	81	834
California	245	3,218
Colorado	58	770

\* No Organized Militia (mustered out May 20, 1906).

For additional information in regard to the work of the army and militia on the border, see sections *Army* and *Foreign Relations* in the article UNITED STATES; see also MILITARY PROGRESS.

**MILK.** Alice C. Evans, of the United States Department of Agriculture, reports in the *Journal of Infectious Diseases*, 1916, xviii, 437, the results of an experiment of 192 samples of freshly drawn milk from 161 healthy cows, the object being to discover the bacterial content of milk freshly drawn, under sanitary conditions. She found streptococci, micrococci, and bacilli. Long-chained streptococci,

which under favorable conditions may become virulent, were found in 15 per cent of the samples, in numbers ranging from a very few up to 264,000 per c.c. Pyogenic staphylococci which may cause furuncles, abscesses, suppuration, and blood poisoning, were found in 53.8 per cent of samples, in numbers as high as 80,000 per c.c. Some of these were virulent, but the majority were not. Pathogenic bacilli were found in 23.4 per cent of the specimens examined, some of which had as many as 50,000 per c.c. While in most cases the normal mucous membrane is resistant to these organisms, even when of virulent type, nevertheless epidemics of sore throat and appendicitis have been traced to milk and particular attention has been directed to the presence of streptococci in normal udders.

Ruehle and Kulp, in Bulletin 409 of the New York Agriculture Experimental Station, have ascertained that the number of bacteria found in the air of representative stables in which milking and feeding with hay, grain, and the like were going on, varied from 50 to 200 per litre of air. The highest record was 825 per litre. In their experiments sterile water was "milked" from an apparatus designed to imitate the ordinary process of milking. The water was then examined and found to possess an average germ content of 12 per c.c. with a maximum of 73. The same process under extremely dusty conditions gave a bacterial content of 30 to 100 per c.c. Under the sanitary conditions, however, found in representative stables, the number of bacteria added to milk would appear to be extremely small, but the experiments point to the necessity of eliminating dust as much as possible during the process of milking and that dust must be taken into consideration along with other sources of contamination, such as the interior of the udders, suggested above, the cow's body, the milker's hands and clothes, and the milking utensils.

Even condensed milk, commonly supposed to be free from bacteria, has been shown to contain several varieties of pathogenic organisms. The latest study of condensed and evaporated milks, by Ida A. Bengston, of the Department of Bacteriology at the University of Chicago, shows that although the bacterial content of condensed milk is as a rule low, yet in a few cases as many as one million per c.c. have been found. Other observers have isolated the streptococcus, staphylococcus, lactic acid producing bacilli, *Bacillus enteritidis sporogenes*, *B. subtilis*, *B. mesentericus*, and the colon bacillus. Moreover, Andrewes of England has proved experimentally that the *Staphylococcus aureus* can grow freely in condensed milk with or without the presence of air. Some of the bacteria in this food product survive evaporation in vacuo, because this may be carried at a temperature considerably below the boiling point of water (212 F.). Organisms may enter from the air or other sources during the process of canning. See also DAIRYING; STRIKES AND LOCKOUTS.

**MILLS, ALBERT LEOPOLD.** An American soldier, died at Washington, D. C., Sept. 18, 1916. He was born in New York City in 1854, graduated from West Point in 1879, the same year became second lieutenant of the First Cavalry, served at Fort Walla Walla, Washington Territory (1879-82), and was employed on frontier duty elsewhere. He fought against the Crow

Indians in 1887 and against the Sioux in 1890. In 1889 he was made first lieutenant. After teaching at the State Academy, Charleston, S. C., in 1886-87, and at the Infantry and Cavalry School at Fort Leavenworth, Kan., in 1894-98, he saw active service as captain and assistant adjutant-general of volunteers in the Santiago campaign in the Spanish-American War. For distinguished gallantry in action near Santiago de Cuba he was voted the Congressional Medal of Honor in 1902. Appointed superintendent of the United States Military Academy, West Point, in August, 1898, he broadened the scope and efficiency of that institution by his administration, but in 1906 he was detached from the command at West Point and was assigned to important duty in the Philippines. In 1904 he was made brigadier-general. In 1909 he returned to the United States to command the Department of the Gulf, and during part of 1912 he was president of the Army War College. After September of that year he was chief of the division of militia affairs on the general staff. In this position the work of federalizing the State troops under the reorganization law devolved largely upon him. In August, 1916, he was promoted to be major-general.

**MILLS, BENJAMIN FAY.** An American clergyman and lecturer, died at Grand Rapids, Mich., May 1, 1916. He was born at Rahway, N. J., in 1857. The year before graduating from Lake Forest University in 1879, he had been ordained to the Congregational ministry, and for a time he was minister of a church at Rutland, Vt. After 1886, for 11 years, he devoted himself to evangelistic work; it was said that during this period he made some 500,000 converts. Then, finding himself out of harmony with trinitarian views, he severed his denominational connection, for two years conducted an independent religious movement in Boston, and from 1899 to 1911 resided in California, first as minister of the First Unitarian church of Oakland, and later as founder and minister of the Los Angeles Fellowship. Mr. Mills went in 1911 to Chicago, where he founded a similar religious organization called the Chicago Fellowship. Since 1915, when he returned to his early faith, he had been holding evangelistic services in different parts of the country. Widely known as a speaker on philosophical and social, as well as religious, subjects, he published, among other books: *God's World, and Other Sermons* (1893); *Twentieth Century Religion* (1899); *The Divine Adventure* (1905).

**MILNER, ALFRED,** first VISCOUNT. A British statesman, appointed Minister without Portfolio in Lloyd George's Cabinet, formed in December, 1916; also a member of the War Council. Lord Milner was High Commissioner for South Africa from 1897 to 1905. Since the beginning of the war, he has become known as a leading advocate of conscription. He is a Unionist.

**MINE PLANTING.** See SUBMARINES.

**MINERALOGY.** New mineral species were added to the list and some important investigations appeared during the past year. Among the works of general scope may be named *The Magic of Jewels and Charms* by G. F. Kunz, a second installment by this authority on the curious beliefs and superstitions connected with precious and rare minerals. It is rich in illustrative material and shows a thorough gleaming

of literature. Comprehensive in treatment, but so far as possible free of technical phrases, O. C. Farrington's *Meteorites: Their Structure, Composition, and Terrestrial Relations* will be found a useful guide both for the scientist and the general reader. The publication of the *Third Appendix* once more brings Dana's *System of Mineralogy*, which is perhaps more widely used as a standard of reference than any other work, to the level of current progress; the new part covers the period 1909-15, wherein a total of 183 new minerals are described. The preparation of the volume has been in charge of W. E. Ford.

A recent research by Johnston, Merwin, and Williams of the Carnegie Geophysical Laboratory develops some important facts in regard to the mineral forms of calcium carbonate. It is found that this substance may occur in three different phases, of which calcite and aragonite are familiar, but the third form has not hitherto been recognized. This is owing, perhaps, to the property it has of changing rapidly to calcite under ordinary conditions of temperature and surroundings. Aragonite, likewise, alters to calcite, but at a much slower rate so that it is fairly common in nature. Of the supposed forms of calcium carbonate previously described under the names of vatervite, conchite, ktypite, and lublinitite, none seems to represent a distinct species when examined in a critical manner. The recognition and differentiation of the several forms must be based on a series of physical, chemical, and optical tests, for no single criterion can be relied upon.

The question of the chemical structure of bornite, one of the most valuable ores of copper, seems at last to have been established, as E. T. Allen has shown that the formula is to be written  $Cu_5FeS_4$  and that previous conclusions of the variability of the mineral were based on analyses of impure material as demonstrated by optical examination of the type specimens. Crystals of bornite are found to contain chalcopyrite and chalcocite, even when they appear quite pure to ordinary methods of examination.

**DIAMOND.** The much discussed problem as to the origin of the South African diamond has been under investigation by Draper and Goodchild, who, after reviewing the evidences, conclude that the diamond has crystallized in place, as a secondary mineral growth, during the period of rock consolidation. The kimberlite pipes are true volcanic vents, and the kimberlite itself is derived from eclogite which during the process of eruption underwent differentiation whereby the heavier olivine and pyroxene constituents sank, forming an ultra-basic mass in the lower regions of the vent. This mass continued molten long after the more acid upper portion was frozen, and through the action of heated vapors of water and of carbon dioxide its viscosity was so reduced as to facilitate crystallization of the diamond. The view of the essentially igneous origin of the mineral already has a preponderance of evidence in its favor, but this new investigation helps to remove some of the difficulties in the way of its general acceptance.

**RUBY.** The manufacture of gem rubies synthetically by which the chemical and physical properties of the natural stones are reproduced in great perfection has made it highly desirable to find some reliable means of distinguishing

the two. Michel gives as a criterion for the artificial stones the presence of concentric banding and lines of bubbles which are due to the method of depositing the molten aluminum oxide. The pear-shaped melt shows an optic axis diagonal to the longer diameter. The production of artificial emerald, topaz, peridote, phenacite, and diamond has not yet been accomplished in a commercial way.

**NEW MINERALS.** The list of mineral species has been increased by the following new forms: *Koehlinite* is a combination of bismuth and molybdenum oxides, and forms greenish-yellow orthorhombic crystals; it is found at Schneeberg, Saxony. *Inyoite*, from the Death Valley region of California, is a glassy, colorless, hydrated borate of calcium and has a monoclinic crystal habit. *Meyerhofferite* resembles inyoite in chemical composition but contains less water and belongs to the triclinic crystal system. It is colorless when fresh, but changes to opaque white on weathering. *Lucinite*, an aluminum phosphate of the same composition as the new gem mineral variscite, is associated with it and forms orthorhombic crystals of nearly octahedral shape. *Laoroite* is a hydrated basic phosphate of aluminum, calcium, manganese, and sodium with some fluorine; it is probably monoclinic; it occurs at Greifenstein, Saxony. *Jesekite*, from the same place, consists of aluminum, calcium, and sodium phosphate, with

microclitic crystallization. *Bazzite* contains the rare element scandium combined with silica, crystallizes in sky-blue hexagonal prisms, and comes from Baveno, Italy. *Bassetite* is a yellow micaceous mineral carrying uranium, from Redruth, Cornwall. *Margarosanite* constitutes another new species from the noted Franklin Furnace, N. J., locality; it is a silicate of lead and calcium, forming colorless plates that seem to be of triclinic habit. *Creedite*, a double salt of calcium and aluminum fluorides and calcium sulphate, occurs in colorless grains and prisms of uncertain, possibly microclitic, form. It comes from Wagon Wheel Gap, Col. *Hibbenite*, a hydrated phosphate of zinc with water of crystallization, occurs at Salmo, B. C., and is an orthorhombic mineral. *Spencerite*, from the same locality, is a similar chemical combination but with the elements in different proportions. *Leifite* is a sodium-aluminum silicate with sodium fluoride; it is found in Greenland.

**MINERAL PRODUCTION.** The production of metals and ores in 1915 was the largest in quantity and value in the record of the mining industry of the country, except that in 1913. The total value of the production of the mines was \$2,393,831,951, compared with a value in 1914 of \$2,115,200,333. The accompanying table gives the comparative production and value of the different minerals and metals for the calendar years 1914-15.

MINERAL PRODUCTS OF THE UNITED STATES  
CALENDAR YEARS 1914 AND 1915

Product	1914		1915

 b Value included under "Unspecified."  
 c Value not included in total value.  
 d Figures for 1914 revised in 1915.

The mineral production in 1916, although exact figures were not available, at the end of the year, was undoubtedly greater than any other year since records have been kept. Never before was so large a draft upon the natural resources of the country as during the year, and never before were the metals extracted from ores of less waste or utilized to better advantage in advancing the general prosperity of the country. Copper made the most notable gain. The output of nearly 2,000,000,000 pounds was double that of 10 years previous, and its value was twice that of the copper produced in 1915. In value copper contended with iron in 1916 for first place among the metals. Together the amount of these two metals produced during the year had a value of more than \$1,000,000,000. The output of zinc from domestic ores increased in 1916 95,000 tons, which makes a new record for the metal. The total value of spelter from ore was \$150,000,000. Lead also showed a large increase. The output was valued at \$75,000,000, which is a gain of more than 50 per cent.

With the activity in metal production the coal mines were operated to meet a heavy demand. Bituminous coal output passed the half million ton mark, an increase of 12½ per cent over 1914. Coke increased 30 per cent. There was a new record also in the petroleum yield. The estimated marketed production of crude petroleum for 1916 was 292,000,000 barrels, or 11,000,000 barrels more than 1915. A mineral

production which furnishes an index for business purposes is cement. In 1916 the production is estimated at 5,000,000 barrels in excess of the output of 1914, while the shipments were even greater, and aggregated 94,600,000 barrels.

Every Western State in 1916 showed a large increase in the yield of metals. Arizona led with a gain of \$100,000,000 over 1914, while Utah and Montana together showed an increase of another \$100,000,000. Alaska had its best year in the production of metals, contributing a total of more than \$50,000,000, or over 50 per cent in excess of any previous year.

**MINIMUM WAGE.** During the last four years there has developed in the United States an extensive public opinion supporting a movement for the enactment of minimum wage laws for women. This movement has been based primarily on various investigations made by both public and private authorities showing that a large proportion of women employed in various branches of unskilled labor were receiving wages much below sums required for the maintenance of normal standards of living. The first legislation was a Massachusetts law enacted in 1912 providing for investigations. Two years later the Massachusetts law was strengthened, and since 1912 Arkansas, California, Colorado, Kansas, Minnesota, Nebraska, Oregon, Utah, Washington, and Wisconsin enacted minimum wage laws of varying scope and thoroughness. Investigating commissions have been created in

various States. In 1916 developments were limited to the further consideration of various problems connected with minimum wage legislation and rulings of previously established commissions.

**MASSACHUSETTS.** A recommendation that adult women employed in women's clothing factories in Massachusetts be paid not less than \$8.75 for a full week's work was made to the Massachusetts Minimum Wage Commission July 19th, by a wage board appointed to investigate the subject. The board further recommended that a wage of not less than \$7 a week be paid to inexperienced women, and not less than \$6 per week to girls under 18 years in the industry. The commission approved the rates provisionally and held public hearings for employers and employees in August. Thereafter the rates were decreed to go into effect Feb. 1, 1917. A report accompanying the recommendation said that after an investigation lasting eight weeks, the board had fixed upon \$8.98 as representing the necessary weekly cost of living for self-supporting women employed in skirt, cloak, suit, dress, and waist factories, this total including an item of 25 cents a week for savings. But the report further stated that, because the proposed minimum wage, \$8.98, was so far above the wages now paid in some establishments, and thus might entail hardships on both employer and employee during readjustment, the committee had reduced the amount to \$8.75.

The executive committee of the Merchants and Manufacturers of Massachusetts issued in August a pamphlet entitled *The Minimum Wage, A Failing Experiment*. This set forth briefly the history of the minimum wage movement in Australasia, England, and the United States and presented criticisms. It was objected to minimum wage laws that they attempted by class legislation aimed at employers and in favor of employees to solve the problem of normal standards of living, which is a community problem and should be met by the community. It was argued that such laws are circular in effect, since they raise the cost of living. They also produce unemployment; the evidence submitted on this point was designed to show that large numbers of girls and women were discharged after minimum wage decrees were issued; but no comparison with the general condition of industry was given. The pamphlet contended that competition between States required that, if any such laws were to be in operation, a Federal law be enacted to equalize wage conditions.

**ILLINOIS.** The O'Hara Vice Commission of the Illinois Senate reported January 19th its findings and conclusions based on an extensive investigation of conditions in Illinois, and especially in Chicago. The investigation was begun in August, 1913, and covered inquiries into conditions existing in Chicago, Springfield, Peoria, Alton, East St. Louis, and other cities of the State. The report asserted that low wages were responsible for the greater part of immorality among young girls; other causes of vice were improper working conditions, insanitary and unsegregated rest rooms for factory girls, and unlimited hours of labor. The report was compiled from the testimony of scores of working girls and their employers. The report recommended many phases of legislation, first of which was the "enactment of a minimum wage law."

**NEW YORK CITY.** The strike among workers

in New York's new subway in the spring was caused by growing dissatisfaction with conditions of work. Ten thousand excavators demanded a wage of \$2 a day, which has come to be a moderate sum even for the unskilled worker. The labor law requires that the wages of such workers be determined in accordance with the "prevailing rate" for the locality where the work is being done. Hence the subway workers believed themselves to be underpaid. The National Consumers' League filed a memorandum with the Thompson Committee, which was investigating the Public Service Commission, recommending regulation of wages and hours, with a minimum rate of pay stipulated in the public contracts. The League said: "The demand for a \$2 rate cannot be considered unreasonable in view of the results of the city's own official investigation of wages. The Municipal Bureau of Standards recently submitted to the Board of Estimates a report on the cost of living for an unskilled laborer's family in New York City. It concluded that below \$840 a year an unskilled laborer's family of five, husband, wife, and three children under 14 years, cannot maintain a standard of living consistent with American ideas." The League stressed the fact of the need of a minimum wage for the muckers as well as other employees of the Public Service Commission in New York City.

**CATHOLIC SOCIETIES.** The 15th annual convention of the Federation of Catholic Societies in New York City in August showed much enthusiasm for the minimum wage. Prof. John A. Ryan of the Catholic University of America was the chief speaker in the discussion. He asserted that the minimum wage was a question of right and wrong in which Catholics should be especially interested. He said further that since 80 per cent of the workers are unorganized, the issue could not be solved by the labor leaders, and that society must regulate industry, as it was as just to regulate wages by law as to compel safety devices or limit exorbitant rates.

Rev. Edwin V. O'Hara, chairman of the Oregon State Commission on the Minimum Wage, was another speaker. He declared that in Oregon, contrary to the fear that the general average of wages would be lowered, a higher percentage of women are now getting \$12 a week than before the passage of the law prescribing a minimum wage for women. After the law went into effect, one evil was discovered, however. It was the practice of discharging the apprentice who receives \$6 a week at the end of the first year and then hiring another apprentice to take her place. This has been remedied by the use of a sliding scale of weekly wages over monthly periods during the first year of work.

**FORD MOTOR COMPANY.** About 1500 women employees of the Ford Company, the majority of them clerks and stenographers, were affected by the ruling which went into effect October 10th, that their minimum daily wage should be \$5, the same as that established for the men in 1913. This ruling was based upon the principle of equal pay for equal work. Some of the workers, especially those in the upholstery department, gained a substantial increase, as some had been paid only \$3 a day. For apprentices under 21, the minimum remains at 26 cents an hour; for apprentices over 21, 34 cents an hour.

and for the trained worker over 21, it is raised to 62½ cents an hour.

THE NATIONAL ASSOCIATION OF MANUFACTURERS at a meeting in New York City discussed a report of its Committee on Industrial Betterment containing a survey of legislative minimum wages, history of such legislation in this country and abroad, outlines of arguments for and against the principle of the minimum wage, and findings of the committee after one year of investigation. This committee concluded: "We are of the opinion that, while certain plausible arguments are advanced in behalf of the minimum wage system, the chief of which being the general impotency of women and minors under all circumstances to safeguard their own wage conditions, we nevertheless believe that economically the weight of the argument is against the extension of the system and its incorporation into our industrial fabric."

THE MINIMUM WAGE COMMISSION of the National Civic Federation on February 20th made a report of its investigations. These covered conditions in 11 States where minimum wage laws were already in force. For a year the committee carried on the work of taking testimonies and opinions of labor leaders, statisticians, representatives of business, and others. After completing the investigation, in substance it recommended as follows: first, that a resolution be passed by Congress directing a joint investigation by the Department of Labor and the Department of Commerce, which shall be provided with enough money to make a thorough inquiry. Objections may be made by employers against further inspection of their books, it was admitted, but the commission was convinced that authoritative knowledge is necessary. Second, that before standards be set for a fair day's pay, some means be devised for determining what is a fair day's work. At present there is no way of knowing what a fair day's work is. Hence it is recommended that there be an unprejudiced and unbiased agency that will enable the employer to know what he should get for his money, and the employee what he is to give in return. A. J. Porter, president of the Shredded Wheat Company, is chairman of the commission; other members are: Percy S. Straus, Dr. Lee K. Frankel, Mrs. Lyndsay Van Rensselaer, Miss Thalia Broen, James W. Sullivan, and H. J. Conway.

AUSTRALIA. Investigations by Paul Collier of the New York State Factory Commission showed that minimum wage regulation is no longer an experiment in Australasia, but is accepted as an inevitable step in labor legislation. Mr. Collier found that the law has given an "impetus to fairer rewards for labor" and that the "weight of opinion is contrary to the supposition that the minimum wage is the maximum." He asserted that the rise of wages has kept pace with the increased cost of living; sweating has been abolished; and women have not displaced men in industry. With the first minimum wage legislation a slight curtailment in labor force followed, but normal conditions were quickly restored. Mr. Collier concluded that the creation of minimum wage boards has had a tendency to strengthen rather than to weaken the power of the trade unions, since they are influential in the nomination of board members and in the initiation of its proceedings.

MINING. See section so entitled under vari-

ous countries; also MINERALOGY; MINERAL PRODUCTION; UNITED STATES, *Bureau of Mines.*

MINNESOTA. POPULATION. The estimated population of the State on Dec. 31, 1916, was 2,296,024. The population in 1910 was 2,075,708.

AGRICULTURE. The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn .....	1916 2,520,000	84,420,000	\$67,536,000
	1915 2,800,000	64,400,000	39,928,000
Wheat .....	1916 3,715,000	27,555,000	44,639,000
	1915 4,160,000	70,870,000	63,788,000
Oats .....	1916 3,325,000	88,112,000	41,413,000
	1915 3,225,000	138,675,000	44,376,000
Potatoes ...	1916 280,000	16,800,000	21,840,000
	1915 285,000	30,210,000	11,782,000
Hay .....	1916 1,890,000	3,496,000	24,472,000
	1915 1,700,000	3,247,000	20,781,000
Rye .....	1916 335,000	5,025,000	6,382,000
	1915 350,000	6,825,000	5,528,000
Barley .....	1916 1,375,000	26,125,000	22,729,000
	1915 1,250,000	88,125,000	18,681,000

a Tons.

MANUFACTURES. The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments..	5,561	5,974
Average number of wage earners .....	84,767	92,834
Capital invested .....	\$275,416,000	\$354,434,000
Wages .....	47,471,000	58,507,000
The value of materials used	281,622,000	336,849,000
The value of products .....	409,420,000	493,354,000

MINERAL PRODUCTION. Minnesota is the first of the States in the production of iron ore. The total quantity mined in 1915 was 33,464,660 gross tons, compared with 21,946,901 gross tons in 1914. The quantity shipped from the mines of the State in 1915 was 32,545,236 tons, compared with 23,298,457 tons in 1914. The value of the ore shipped in 1915 was \$57,742,643, compared with a value in 1914 of \$40,628,771, an increase of \$9,246,889, or over 40 per cent. All the iron ore mined in the State is hematite.

TRANSPORTATION. The total mileage of railroad track in the State on June 30, 1916, was 89,906. The lines having the longest mileage are the Great Northern 2100, Minneapolis, St. Paul, and Sault Ste. Marie, 1131, Chicago, Milwaukee, and St. Paul, 1233, and the Northern Pacific, 1021.

EDUCATION. The total enrollment in the public schools of the State in 1916 was 481,583. The average daily attendance was 374,632. The teachers numbered 17,792. The average monthly salary of male and female teachers was \$62.15. The Legislature of 1915 passed a law establishing day schools for deaf, dumb, and blind subnormal children, and those of defective speech. These special schools are established in connection with public schools. The same Legislature passed a law establishing a State teachers' retirement fund. These were in operation in 1916.

FINANCE. The latest report of the State Treasurer is for the fiscal year 1916. There was

a balance on July 31, 1914, of \$3,807,000. The receipts for the year amounted to \$22,481,933, and the disbursements to \$22,957,757, leaving a balance on July 31, 1915, of \$3,332,006.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Anoka State Asylum, Hastings State Asylum, the Fergus Falls State Hospital, the Rochester State Hospital, St. Peter State Hospital, School for the Blind at Faribault, School for the Deaf and the School for the Feeble-Minded, both at Faribault, Owatonna State Public School, the Red Wing State Training School, the Sauk Center Home School for Girls, St. Cloud Reformatory, the Stillwater State Prison, the State Sanatorium for Consumptives, Phalen Park Hospital for Crippled Children, and the Willmar State Hospital for Inebriates. The total number of inmates in these institutions is about 10,000.

**STATE LEGISLATURE.** Legislature non-partisan.

**POLITICS AND GOVERNMENT.** The campaign in Minnesota was an aggressive one, and the results were so long in doubt, that it took over a week to determine who had received a plurality of the votes for President. (See UNITED STATES, *Presidential Campaign*.) Elections were held for Governor and United States Senator. The Republican candidate for Governor, J. A. A. Burnquist, was elected by an enormous plurality. He received 245,852 votes, compared with 93,115 for Dwyer, his Democratic opponent. For United States Senator, E. J. Kellogg, the Republican nominee, received 185,171 votes, compared with 117,543 for Lawler, his Democratic opponent. For President, Hughes received 179,553 votes, and Wilson 179,157, or a plurality of 396 votes for Mr. Hughes. The Republicans elected all their State officers, except Adjutant-General, and Commissioner of Insurance.

**STATE OFFICERS.** Governor, J. A. A. Burnquist; Lieutenant-Governor, Thomas Frankson; Secretary of State, Julius A. Schmahl; Auditor, J. A. O. Preus; Treasurer, Henry Rines; Attorney-General, L. A. Smith; Adjutant-General, Fred B. Wood; Superintendent of Education, C. G. Schultz; Commissioner of Insurance, S. D. Works—all Republicans except Wood (not stated), and Works, Democrat.

**JUDICIARY.** Supreme Court: Chief Justice, Calvin L. Brown; Associate Justices, G. L. Bunn, Oscar Hallam, Andrew Holt, James H. Quinn; Clerk, I. A. Caswell.

**MINNESOTA, UNIVERSITY OF.** A State educational institution in Minneapolis, Minn., founded in 1868. In all departments of collegiate work the total enrollment in the fall of 1916 was 5114. Including teaching fellows, the faculty numbered 812. During the year the president, George Edgar Vincent, resigned to assume the presidency of the Rockefeller Foundation. The productive funds of the university amount to \$1,647,059 and the income for 1916 was about \$61,000. The library contains 206,700 bound volumes and 52,300 unbound volumes and pamphlets.

**MISSISSIPPI. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 1,964,122. The population in 1910 was 1,797,114.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

		Acreage	Prod. Bu.	Value
Corn	.....1916	3,400,000	47,600,000	\$46,648,000
	.....1915	3,550,000	67,450,000	48,842,000
Wheat	.....1916	6,000	90,000	158,000
	.....1915	5,000	100,000	105,000
Oats	.....1916	320,000	5,760,000	4,282,000
	.....1915	300,000	6,450,000	3,870,000
Rice	.....1916	1,900	53,000	42,000
	.....1915	1,800	45,000	40,000
Potatoes	..1916	12,000	780,000	1,248,000
	.....1915	13,000	1,170,000	983,000
S. potatoes	..1916	77,000	6,314,000	4,280,000
	.....1915	75,000	8,250,000	4,538,000
Hay	.....1916	275,000	a 371,000	4,081,000
	.....1915	250,000	350,000	3,850,000
Cotton	.....1916	3,114,000	b 800,000	78,523,000
	.....1915	2,785,000	954,000	52,511,000

a Tons. b Bales.

See also AGRICULTURAL LEGISLATION.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . . . . .	2,598	2,209
Average number of wage earners . . . . .	50,884	46,702
Capital invested . . . . .	\$72,393,000	\$81,006,000
Wages . . . . .	18,768,000	19,177,000
The value of materials used . . . . .	36,926,000	41,840,000
The value of products . . . . .	80,555,000	79,550,000

**TRANSPORTATION.** The railway mileage of the State in 1916 was 4351. There was no construction during the year.

**EDUCATION.** The number of school children in the State in 1916 was 788,927. Considerably over half the children of school age in the State are colored. In addition there are about 400 Indian children of school age. The State has no compulsory school law.

**FINANCE.** The latest statistics available for the State are for 1915. In that year the receipts amounted to \$3,873,254, and the disbursements to \$4,248,109. There was a balance at the beginning of the year of \$636,708, and at the end of \$261,362. The bonded debt of the State is \$2,500,000.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State are under the control of the State board of charities and corrections. They include the State prison, Institute for the Blind, Institute for the Deaf and Dumb, and Charity Hospital, all at Jackson. There are also hospitals at Vicksburg and at Natchez.

**POLITICS AND GOVERNMENT.** There was no election for State officers in 1916. Senator Williams was reelected, practically without opposition. For President, Wilson received 80,422 votes, and Hughes 4253.

**LEGISLATION.** The Legislature met in 1916 and enacted many important measures. A record of these follows:

An amendment adopted by the people in November, 1914, increasing the number of Supreme Court judges to six, requiring them to be elected by the people, and fixing their terms at eight years was inserted in the State constitution. There was also inserted in the constitution an amendment adopted by the people in 1914 permitting the Legislature to provide that in all civil cases, circuits or chancery courts, nine or more jurors may agree on the return of verdict.

A State board of law examiners was created, and measures were passed admitting women to the practice of law. Public hangings were prohibited. Lobbying before the Legislature was regulated. Measures were passed regulating the purchase of text books, and the subjects to be taught in the public schools. It was made a misdemeanor to mutilate or otherwise misuse the United States flag. The law applies to the State and Confederate flags as well as to the United States flag. The laws relating to fire and life insurance were amended.

**STATE OFFICERS.** Governor, Theodore G. Bilbo; Lieutenant-Governor, Lee M. Russell; Secretary of State, J. W. Power; Treasurer, J. P. Taylor; Auditor, Robert E. Wilson; Adjutant-General, E. C. Scales; Superintendent of Education, W. F. Bond; Attorney-General, Ross A. Collins; Land Commissioner, M. A. Brown; Commissioner of Agriculture, P. P. Garner; Commissioner of Insurance, T. M. Henry—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, S. Smith; Associate Justices, S. C. Cook, J. Morgan Stevens, E. O. Sykes, J. B. Holden, George H. Ethridge; Clerk, George C. Myers.

**STATE LEGISLATURE.** The State Legislature is wholly Democratic.

**MISSISSIPPI, UNIVERSITY OF.** A State educational institution at Oxford, Miss., founded in 1844. In the autumn of 1916 there were 592 students enrolled and the faculty numbered 38. The productive funds of the institution amount to \$700,000. The library contains 31,000 volumes. Chancellor, Joseph Neely Powers.

**MISSOURI. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 3,420,143. The population in 1910 was 3,203,335.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	6,775,000	132,112,000	\$118,901,000
1915	6,500,000	191,750,000	109,298,000
Wheat . . . . . 1916	1,950,000	16,575,000	27,849,000
1915	2,778,000	84,108,000	38,426,000
Oats . . . . . 1916	1,290,000	32,250,000	17,092,000
1915	1,325,000	31,850,000	12,108,000
Rye . . . . . 1916	21,000	281,000	284,000
1915	25,000	338,000	291,000
Barley . . . . . 1916	5,000	100,000	93,000
1915	5,000	125,000	79,000
Potatoes . . . . . 1916	91,000	5,460,000	9,828,000
1915	90,000	8,820,000	5,292,000
Hay . . . . . 1916	8,850,000	a 4,355,000	40,502,000
1915	8,050,000	4,638,000	39,406,000
Tobacco . . . . . 1916	8,200,000	b 8,040,000	456,000
1915	3,500,000	3,150,000	378,000
Cotton . . . . . 1916	182,000	c 62,000	5,644,000
1915	96,000	48,000	2,527,000

a Tons. b Pounds. c Bales.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments..	8,375	8,386
Average number of wage earners . . . . .	152,993	152,182
Capital invested . . . . .	\$544,348,000	\$522,548,000
Wages . . . . .	80,848,000	89,197,000
The value of materials used.	354,411,000	388,715,000
The value of products . . . . .	574,111,000	637,952,000

**MINERAL PRODUCTION.** The production of silver, copper, lead, and zinc in the State in 1915 was valued at \$53,683,420, compared with \$25,874,864 in 1914. Lead is the most important mineral product. The value of the lead mined increased \$4,757,624 so that the largest increase in the total value was caused chiefly by the much larger output under higher prices of spelter in 1915 compared with 1914. The total production of lead was 210,440 tons, compared with 192,612 tons in 1914. In 1915 the value was \$19,781,360, compared with a value of \$15,823,736 in 1914. The zinc produced in 1915 amounted to 136,300 tons, valued at \$33,802,400, compared with 105,994 tons, valued at \$10,811,388, in 1914.

**TRANSPORTATION.** The railway mileage of the State is about 8150. The roads having the longest mileage are the St. Louis and San Francisco, 1719; Chicago, Burlington, and Quincy, 1135; Missouri and Pacific, 1013; and the Wabash Railroad, 655. These figures are for single track only.

**EDUCATION.** The latest figures available for education are for 1915. In that year the total number of students of school age was 922,731. The total enrollment was 711,355. The average daily attendance was 528,153. The total number of teachers was 19,826. The average annual salary of male teachers was \$603, and of females \$511. The total amount of payments for educational purposes during the year was \$19,700,000.

**FINANCE.** The latest report for the finances of the State is for the fiscal year 1914. The total receipts for that year amounted to \$10,538,368, and the disbursements to \$10,862,194, leaving a balance in the treasury on Jan. 1, 1915, of \$534,944.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions are under the supervision of the State Board of Charities and Corrections. They include hospitals at Fulton, St. Joseph, Nevada, and Framington, Industrial School for Boys at Boonville, Colony for Feeble-Minded and Epileptics at Marshall, Missouri School for the Deaf at Fulton, Missouri School for the Blind at St. Louis, Federal Soldiers' Home at St. James, Confederate at Higginsville, State Sanatorium at Mount Vernon, State Penitentiary at Jefferson City.

**POLITICS AND GOVERNMENT.** Early in the 1916 campaign Missouri was regarded as one of the possibly doubtful States because of local issues. Though the Democrats controlled the State offices, had 14 of the 16 Congressmen and both United States Senators, there was much criticism of the Democratic State administration's financial record. The Republicans were centering their attacks on the lack of State funds, asserting State bankruptcy because of overappropriation, that educational and eleemosynary institutions were suffering from lack of funds, and that several of these were operating on borrowed money.

Democratic campaigning opened early with a series of "harmony meetings" over the State. In both parties the primary campaigning was marked by much bitterness. The "wet and dry" issue loomed immediately. In the primaries of August the avowedly "dry" gubernatorial candidates of both parties were defeated, taking that issue out of the fight for State offices, but the Anti-Saloon League immediately invoked the initiative and forced a con-

stitutional amendment for State-wide prohibition on the ballot.

The Democrats nominated Frederick D. Gardner, author of the Gardner Land Bank bill passed by the Assembly in 1914. This measure appeared on the 1916 ballot as a proposed amendment to the constitution. The Republicans named Henry Lamm, former member of the Missouri Supreme Court. The Progressive party practically disappeared in the State, the only State candidate named being Joseph Fontron, for Governor. As required by Missouri law the candidates of both parties met immediately following the primary and drafted their platforms, stressing the need of reform in State affairs.

The Gardner Land Bank bill immediately became one of the issues of the campaign. It was attacked as weak, useless, and unnecessary in view of the passage of the Federal Farm Loan Act. Throughout the campaign the Republicans urged consideration of State issues, while the Democrats made their fight for the most part on national questions.

The vote for President in the State was: Wilson, 398,032; Hughes, 369,339; Hanly, 3884; Benson, 14,612; Reimer, 902. For Senator, James A. Reed, Dem., 396,166; Walter S. Dickey, Rep., 371,710; O'Hare, Soc., 14,654; Scheidler, Soc. Labor, 962. For Governor: Gardner, Dem., 382,355; Lamm, Rep., 380,092; Fontron, Prog., 4041; Adames, Soc., 14,555; Rogers, Soc. Labor, 946. With one exception the Democratic State ticket was elected, the Republicans winning the State Auditor's office by 9080 votes. The Democrats elected 14 of the 16 Congressmen, two St. Louis districts returning Republicans. Hughes carried St. Louis by 9739 votes, Wilson carrying Kansas City, including Jackson county, by 11,613.

The following constitutional amendments were voted upon: No. 1, concerning pensions for the blind, was carried by 385,627 to 272,908; No. 2, State Land Bank bill, lost by 296,964 to 346,443; No. 3, for prohibition, lost by 294,288 to 416,826.

**STATE OFFICERS.** Governor, Frederick D. Gardner; Lieutenant-Governor, Wallace Crossley; Secretary of State, John L. Sullivan; Auditor, George E. Hackmann; Treasurer, George H. Middelkamp; Attorney-General, Frank W. McAllister; Superintendent of Education, Vel W. Lamkin—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Archelaus M. Woodson; Associate Justices, Walter W. Graves, Robert F. Walker, Charles B. Faris, H. W. Bond, James T. Blair, Fred L. Williams; Clerk, Jacob D. Allen.

**STATE LEGISLATURE.**

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>

Republicans .....	8	64	72
Democratic majority ..	18	14	32

**MISSOURI, UNIVERSITY OF.** A co-educational State institution at Columbia, Mo., founded in 1839. The School of Mines is at Rolla, Mo. In the fall of 1916, 2790 students were registered. The enrollment of the summer session was 1320. The faculty numbered 326. The productive funds of the institution amounted to \$1,309,339, and for the fiscal year ending June 30th the total income was \$1,353,766. The library con-

tains 185,000 volumes. President, Albert Ross Hill.

**MOBILIZATION.** See MILITARY PROGRESS.

**MODERN SCHOOL, THE.** Early in 1916 Mr. Abraham Flexner, a secretary of the General Education Board, presented a report entitled "A Modern School." In many particulars the ideas advanced by Mr. Flexner were not new, but the connection of the author with one of the greatest educational agencies in the country served to call attention to these ideas in a very pronounced manner. Various important educational conferences and meetings have had this as one of the topics for definite discussion. A great many articles either favoring or opposing the changes suggested by Mr. Flexner have appeared in periodicals. Altogether it has been one of the most important questions of the past year.

Mr. Flexner gave his conception of modern education by describing a man educated in the modern sense as contrasted with an uneducated man—"uneducated in the modern sense." "In the first place a man educated in the modern sense has mastered the fundamental tools of knowledge; he can read and write; he can spell the words he is in the habit of using; he can express himself clearly orally or in writing; he can figure correctly and with moderate facility within the limits of practical need; he knows something about the globe on which he lives. So far there is no difference between a man educated in the modern sense and a man educated in any other sense. There is, however, a marked divergence at the next step. A man educated in the modern sense will forego the somewhat doubtful mental discipline received from formal studies; he will be contentedly ignorant of things for learning which no better reason than tradition can be assigned. Instead his education will be obtained from studies that serve real purposes. The object in view would be to give him the knowledge he needs and to develop in him the power to handle himself in his own world. Neither historic nor what are called purely cultural claims would alone be regarded as compelling. The curriculum includes nothing for which an affirmative case cannot now be made out."

In describing the curriculum of the proposed "Modern School," Mr. Flexner said in part: "The modern school would drop the study of formal grammar. It would not go through the form of teaching children useless historic facts just because previous generations of children have learned and forgotten them; it would have the courage not to read obsolete and uncongenial classics, simply because tradition has made this sort of acquaintance a kind of good form. Neither Latin nor Greek would be contained in the curriculum—not, of course, because their literatures are less wonderful than they are reputed to be, but because their present position in the curriculum rests upon tradition and assumption. A school trying to produce a resourceful modern type of educated man and woman would provide practical training in one or more modern languages. A realistic treatment of literature would take hold of the child's

normal and actual interests in romance, adventure, fact or what not, and endeavor to develop them into as effective habits of reading as may be. The modern school would, in the same way, endeavor to develop a spontaneous, discriminating, and genuine artistic interest and appreciation—rather than to fashion makers of music and art. It would from the first undertake the cultivation of contacts and cross-connections. Every exercise would be a spelling lesson; science, industry, and mathematics would be inseparable; science, industry, history, civics, literature, and geography would to some extent utilize the same material."

Two questions are raised in connection with the possible results of the proposed system—"the question of discipline, moral and mental, and the question of interest or taste." Advocates of the Modern School feel that "it is absurd to invent formal difficulties for the professed purpose of discipline when within the limits of science, industry, literature, and politics real problems abound. The Modern School would 'discipline the mind' in the only way in which the mind can be effectively disciplined—by energizing it through the doing of real tasks. As to the second question, the Modern School undertakes a large and free handling of the phenomenal world, appealing in due course to the observational, the imaginative, and the reasoning capacities of the child; and in precisely the same spirit and with equal emphasis it will utilize art, literature, and music.

"The education of the particular pupils who attend the Modern School might prove to be the least of the services rendered by the school. More important would perhaps be its influence in setting up positives as against dogmatic educational standards. We go on teaching this or that subject in this or that way for no better reason than that its ineffectiveness or harmfulness has not been established. Medicines were once generally and are still not infrequently prescribed on exactly the same basis. Modern teaching, like modern medicine, should be controlled by positive indications." He further states: "Not only do American children as a class fail to gain either knowledge or power through the traditional curriculum—they spend an inordinately long time in failing. The period spent in school and college before students begin professional studies is longer in the United States than in any other Western country. An economy of two or three years is urgently necessary.

"The inauguration of the experiment here discussed would be at first seriously hampered because of the lack of school paraphernalia adapted to its spirit and purposes. Text-books, apparatus, and methods would have to be worked out—contrived, tentatively employed, remodeled, and tried elsewhere, and so on. In the end the implements thus fashioned would be an important factor in assisting the reorganization and reconstruction of other schools—schools that could adopt a demonstration, even though they could not have made the original experiment.

"Finally, the Modern School, seeking not only to train a particular group of children but to influence educational practice, can be a seminary for the training of teachers, first its own, then others who will go out into service. The difficulty of recruiting a satisfactory staff to begin with must not be overlooked; for available teach-

ers have been brought up and have taught on traditional lines. On the other hand, the spirit of revolt is rife; and teachers can be found whose efforts have already passed beyond conventional limits. With these the new enterprise would be started."

A report previously issued by the General Education Board dealt with American Secondary Education, by Charles W. Eliot. Ex-President Eliot urged that the most important part of education has always been the training of the senses and that the provision for this training in our present educational scheme is inadequate. Our present system of education has been inherited from ancient times and is based chiefly on literature. "A survey of the programmes of the existing American secondary schools—public, private, and endowed—would show that as a rule they pay little attention to the training of the senses and provide little opportunity for the training of the eye, ear, or hand, or any acquaintance with the accurate recording or cautious reasoning which modern science prescribes." The author stated that "the changes which ought to be made immediately in the programmes of American secondary schools, in order to correct the glaring deficiencies of the present programmes, are chiefly: The introduction of more hand, ear, and eye work—such as drawing, carpentry, turning, music, sewing, and cooking, and the giving of much more time to the sciences of observation—chemistry, physics, biology, and geography—not political, but geological and ethnographical geography. These sciences should be taught in the most concrete manner possible—that is, in laboratories with ample experimenting done by the individual pupil with his own eyes and hands, and in the field through the pupil's own observation guided by expert leaders. In secondary schools situated in the country the elements of agriculture should have an important place in the programme, and the pupils should all work in the school gardens and experimental plots, both individually and in cooperation with others. In city schools a manual training should be given which would prepare a boy for any one of many different trades, not by familiarizing him with the details of actual work in any trade, but by giving him an all-around bodily vigor, a nervous system capable of multiform coordinated efforts, a liking for doing his best in competition with mates, and a widely applicable skill of eye and hand. Again, music should be given a substantial place in the programme of every secondary school, in order that all the pupils may learn musical notation, and may get much practice in reading music and in singing. Drawing, both freehand and mechanical, should be given ample time in every secondary school programme; because it is an admirable mode of expression which supplements language and is often to be preferred to it, lies at the foundation of excellence in many arts and trades, affords simultaneously good training for both eye and hand, and gives much enjoyment throughout life to the possessor of even a moderate amount of skill."

In order to put this scheme into operation Ex-President Eliot recommends that the time given to memory subjects and mathematics should be somewhat reduced, that the school day should be lengthened, and that the long summer vacation should be shortened. He states that these changes would add to the annual cost of the

school because more teachers would be required and a larger proportion of them would be men. See also EDUCATION IN THE UNITED STATES.

**MOLTKE, HELMUTH VON.** A German soldier, died in Berlin June 18, 1916, while attending the Reichstag memorial service for Field Marshal von der Goltz. Nephew of the great Moltke, who was so largely responsible for the Prussian success against France in 1870-71, Helmuth von Moltke was born at Gersdorf, Mecklenburg-Schwerin, in 1848. After an education at a realgymnasium, he served in the Franco-Prussian War, and later attended the Kriegsakademie. By 1882 he had become adjutant to his uncle, after whose death in 1891, he was chosen by the Kaiser as his personal aide-de-camp, with the rank of major. His rise was rapid, for he had become a favorite of the Emperor, who, recognizing his abilities, created for him in 1904 a post, that of quartermaster-general on the general staff, previously filled only during war. Two years later he was appointed to succeed General von Schlieffen as chief of the general staff. Instead of furthering the Kaiser's ideas of military training, which laid emphasis on cavalry charges and other spectacular movements, von Moltke proceeded to train the army along the lines that later proved, in the European war, to be characteristic of modern battles, endurance and overwhelming pressure, rather than swift action. That the German army had ready for instant use such remarkable equipment at the opening of the great war was largely due to Moltke's efforts; in 1913 alone he had procured the grant of \$250,000,000 for army expenditure. Von Moltke was chief of the general staff only during the first months of the war, till December, 1914, when he was succeeded by General Falkenhayn. However, from the beginning of the next year till his death, he served as chief of the supplementary general staff. The reason for his retirement from active command was given as illness, but it was generally believed that in several instances his views had failed to coincide with the Kaiser's on important strategic questions, and that the Chief had refused to yield. The dash toward Paris had been of Moltke's planning, and when this was repulsed, he favored pressure on the region around Verdun, rather than the effort, advocated by the Kaiser, to press back the Allies' lines in Flanders and reach Calais. His adherence to Christian Science was regarded by German military circles as a weakness.

**MONACO.** A constitutional European monarchy, occupying 1.5 square kilometers; population, 19,121. The city of Monaco has 2410 inhabitants, La Condamine 6218; Monte Carlo, 3794. No creed but Roman Catholicism is tolerated. There is no cultivation. The revenue is chiefly derived from the gaming concession at Monte Carlo. The constitution dates from Jan. 5, 1911. The reigning prince (house of Goyonde-Matignon-Grimaldi) is Albert, born 1848, came to the throne 1889. He married in 1869 Lady Mary Douglas-Hamilton (mother of the heir-apparent, Louis, born 1870). This marriage being dissolved in 1880 he married Alice, dowager Duchess of Richlieu (née Heine); this union was also dissolved (1902).

**MOND, SIR ALFRED M.** See GREAT BRITAIN, Government.

**MONGOLIA.** A vast Chinese dependency lying west of Manchuria and between China proper

and Siberia. Neither area nor population is definitely known; the former is estimated at 1,076,292 square miles, while the estimated number of inhabitants is 1,800,000. Higher estimates for both area and population have been published. The country consists of Inner Mongolia, at the south, and Outer Mongolia, at the north. After the outbreak of the Chinese revolution, Outer Mongolia declared its independence, having apparently the support of Russia. In the autumn of 1913, an agreement was reached between China and Russia, whereby China recognized the autonomy of Outer Mongolia and Russia recognized Chinese suzerainty therein.

**MONITORS (FOR BRITISH NAVY).** See NAVAL PROGRESS.

**MONTANA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 466,214. The population in 1910 was 376,053.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn ..... 1916	74,000	1,850,000	\$1,720,000
..... 1915	70,000	1,960,000	1,852,000
Wheat ..... 1916	1,485,000	28,655,000	46,184,000
..... 1915	1,590,000	42,180,000	82,900,000
Oats ..... 1916	660,000	25,080,000	11,788,000
..... 1915	600,000	31,200,000	9,984,000
Potatoes ... 1916	39,000	4,875,000	5,850,000
..... 1915	39,000	6,045,000	3,022,000
Hay ..... 1916	825,000	1,402,000	15,422,000
..... 1915	775,000	1,550,000	11,625,000
Eye ..... 1916	10,000	205,000	197,000
..... 1915	10,000	225,000	146,000
Barley ... 1916	95,000	2,650,000	2,022,000
..... 1915	80,000	2,720,000	1,806,000
Flaxseed ... 1916	325,000	3,088,000	7,658,000
..... 1915	250,000	2,625,000	4,462,000

<sup>a</sup> Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments ....	677	989
Average number of wage earners	11,655	13,704
Capital invested .....	\$44,588,000	\$79,246,000
Wages .....	10,901,000	13,001,000
The value of materials used..	49,180,000	46,744,000
The value of products.....	73,272,000	84,446,000

**MINERAL PRODUCTION.** The value of the output in gold, silver, copper, lead, and zinc in 1916 was over \$145,000,000, which is greater than that of any previous year, and an increase over 1915 of over \$62,000,000, or nearly 76 per cent. There was a decrease in the output of gold, but an increase in all other metals. The mined output of gold was valued at \$4,635,000, a decrease of nearly 14 per cent from \$5,400,195 in 1915. The output of silver increased from 14,378,437 ounces in 1915 to 16,686,000 in 1916. The value on account of better prices increased from \$7,298,868 to \$10,979,000, or nearly 51 per cent. The mined production of copper increased from 267,231,014 pounds in 1915 to 357,000,000 pounds in 1916, or an increase of nearly 90,000,000 pounds. The increase in value was proportionally more owing to the unusually high price from \$46,765,427 to \$97,461,000, an increase of

over 108 per cent. The mined output of lead increased from 13,756,456 pounds in 1915 to 16,933,000 pounds in 1916, a gain of over 3,000,000 pounds. The value of the output was nearly double, increasing from \$646,549 in 1915 to over \$1,151,000, or 78 per cent. The mined production of zinc increased from 187,146,895 pounds in 1915 to 227,000,000 in 1916, an increase of nearly 40,000,000 pounds. The value of the output increased from \$23,206,215 in 1915 to \$31,099,000, or 31 per cent.

The coal production of the State in 1915 was 2,789,755 short tons, valued at \$4,526,509, which was almost exactly equal to the production of 1914. There were employed in the coal mines of the State in 1915 3350 men, compared with 3158 in 1914. The mining of metal for 1915 was a record for the State.

In September President Wilson restored to entry 1,892,468 acres of land in the northern and northeastern parts of the State. This land was theretofore included in coal withdrawals. A large part of it had been under the homestead and other non-mineral land laws. The entire restored area has been classified by the Geological Survey. Areas classified as coal are open to absolute sale and entry under the coal land laws.

**TRANSPORTATION.** The total railway mileage of the State in 1915, the latest date for which figures are available, was 4806. These include main track only. The roads having the longest mileage are the Great Northern 1698, Northern Pacific 1464, Chicago, Milwaukee, and St. Paul 1056.

**EDUCATION.** The latest statistics for education available are for 1914. The number of pupils enrolled in that year was 85,782. Of these 43,046 were males, and 42,736 females. The average daily attendance was 62,686. The total number of children of school age in 1913, when the latest census was taken, was 114,032. The total number of teachers was 3778 in 1914, of whom 3252 were females, and 526 males. The average monthly salary of male teachers was \$93.29, and of females \$75.55. The total receipts for educational purposes for the year ending Aug. 31, 1914, were \$6,951,903.

**FINANCE.** The latest statistics available for the State are for the year ending June 30, 1914. During that year there were aggregate receipts to the amount of \$5,550,909, and the disbursements amounted to \$5,207,011. At the beginning of the year there was a balance of \$1,039,749, and at the end, of \$1,383,646.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the State Prison at Deer Lodge, the State Industrial School at Miles City, a home for orphans, foundlings, and destitute children at Twin Bridges, a Soldiers' Home at Columbia Falls, the State Hospital for the Insane at Warm Springs, and the State School for the Deaf and Blind and Feeble-Minded at Boulder.

**POLITICS AND GOVERNMENT.** As a result of the election of 1916, the distinction came to Montana of sending the first woman to the Congress of the United States. Miss Jeannette Rankin of Missoula was chosen to the national House of Representatives as one of the two members from the Treasure State. She was elected as a Republican. Miss Rankin has been the State's most active worker for woman suffrage and it was due largely to her efforts that

the right to the ballot was granted her sex in Montana. She is a resident of Missoula, which city also is the home of Congressman John M. Evans, Montana's two Congressmen being elected at large. Congressman Evans is a Democrat, and has served two terms in the House.

President Wilson carried the State by a vote that illustrates the growth of Montana during the last four years, although the great increase is partially accounted for by the granting of the franchise to women. At the last election, President Wilson received 22,000 more votes than were cast for all presidential candidates four years ago. In 1912 his vote was 27,941; in 1916, 101,063. The vote for Hughes was 66,750; in 1912 Roosevelt received 22,456, Taft 18,512, Debs 10,885. There were almost 100,000 more votes cast for President in 1916 than at the previous election.

Montana has joined the ranks of the dry States. The vote for prohibition was 102,776, against 73,890. By act of the last Legislature by which the question of prohibition was referred to the people, it was provided that if carried it should go into effect on Jan. 1, 1919. The referendum to permit boxing under a commission was defeated, 76,510 to 71,562.

While the electorate gave its vote to the Democratic candidate for President and reelected Senator Henry L. Myers, Democrat, to the upper branch of Congress, it divided its preference for State officials, electing six Republicans and four Democrats. Gov. S. V. Stewart was reelected after one of the hardest gubernatorial campaigns the State has ever known, as was Lieut.-Gov. W. W. McDowell. Both are Democrats.

The official vote for candidates for President and Senator was as follows:

President—Wilson (D), 101,063; Hughes (R), 66,750; Benson (S), 9564.

United States Senator—Henry L. Myers (D), 85,580; Charles N. Pray (R), 72,753; Henry La Beau (S), 9292.

**STATE OFFICERS.** Governor, Samuel V. Stewart; Lieutenant-Governor, W. W. McDowell; Secretary of State, Charles T. Stewart; Attorney-General, S. C. Ford; Adjutant-General, Phillip Greenan; Treasurer, H. L. Hart; Auditor, W. Keating; Superintendent of Public Instruction, \_\_\_\_\_; all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Theo. Brantly; Justices, Sydney Sanner, William L. Holloway; Clerk, J. T. Carroll.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Democrats .....	14	49	63
Republicans .....	27	46	73
Majority .....	13 R	3 D	10 R

**MONTANA, UNIVERSITY OF.** A State co-educational institution at Missoula, Mont. In the fall of 1916 there were 601 students and 60 faculty members. H. E. Smith (commerce and accounts), Walter Pope (law), George Clarey (law), and Ralph Casey (journalism) were added to the faculty. The income is obtained from State appropriations. The library contains 30,000 volumes.

**MONTENEGRO.** One of the Balkan states overthrown by the German invasion of 1915; a constitutional (1905) hereditary European monarchy, lying between the Herzegovina and

Albania and having an outlet on the Adriatic Sea. The area, previous to the wars in the Balkans, was 9080 square kilometers (3506 square miles). By the conclusion of the treaty of Bucharest, Montenegro gained the western portion of the sanjak of Novibazar, Ipek, and Jakova—territories estimated to cover 2130 square miles. The original population numbered about 285,000 (31 to the square kilometer); the population of the new territories is estimated at 150,000. The majority of Montenegrins belong to the Greek Orthodox Church. Cetinje, the capital, has 5300 inhabitants (exclusive of the garrison); Podgoritsa, 10,053; Dulcigno, 5081; Niksbich, 4972; Antivari, 2371; Niégosh, 1890; Riéka, 1557; Danilovgrad, 1125; in the new territories, Diahobitza, 14,050.

Montenegro is well adapted for grazing; considerable herds roam the mountain pastures. Some crops are raised, corn, potatoes, and tobacco being among the most important. Much of the country is heavily forested. The chief products and exports are hides, wool, horses, cattle, olive oil, sheep, etc. The exports for 1911 were valued at 2,392,000 kronen; in 1909, at 2,435,550 kronen. The imports for 1911 were valued at 8,167,000 kr. (6,181,369 kr. in 1909). A railway (18 kilometers) runs from Antivari to Lake Scutari. Telegraph lines 850 km.; stations, 24; post offices, 21. The budget for 1914 estimated the receipts at £390,000 and the expenditure at £504,000. The public debt amounts to 9,500,000 kr.

Nicholas I (born Oct. 7, 1841), the reigning monarch, succeeded his uncle, Prince Danilo, who was assassinated August, 1860; he married in the same year Princess Milena, daughter of the voyvode Peter Voucotich. He took the title of king in 1910. Heir-apparent, Prince Danilo, born June 29, 1871, and married (1899) to the Duchess Jutta of Mecklenburg-Strelitz.

After the downfall of his kingdom, the King went to Italy and afterwards to France on January 24th, when the government was transferred to the city of Bordeaux. The head of the government was Lazare Mouchevovitch. The King, in an open letter of May 22nd, repudiated six Montenegrin ministers who remained in Montenegro, and also the King's son, who either as a guest or as a prisoner, was in Vienna. In July, an insurrection under General Vischovitch against the Austrian authorities was reported.

**MONTSERRAT.** A presidency of the LEEWARD ISLANDS (q.v.).

**MOON.** See ASTRONOMY; METEOROLOGY.

**MOORE, EDWARD.** An English clergyman, educator, and scholar, died Sept. 2, 1916, at Chagford, Devonshire. He was born in Cardiff. At Pembroke College, Oxford, he took high honors, and after his graduation was fellow and tutor of Queen's College; was identified with the university actively for most of his life, and as principal of St. Edmund Hall from 1864 to 1913. Of both Pembroke and Queen's he became honorary fellow. In 1903 he was appointed canon of Canterbury Cathedral. Recognition of his scholarly achievements brought him election to the Accademia della Crusca and the British Academy and an honorary D. Litt. from Dublin. Except for editions of Aristotle's *Ethics and Poetics*, Dr. Moore confined himself to writing on Dante, his works including, among others,

three series of *Studies in Dante*, *Contributions to the Textual Criticism of the Divina Commedia* (the most important of all), and the *Oxford Dante*. He initiated the Oxford Dante Society.

**MOORE, GEORGE.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, English.

**MOORE, JAMES HOBART.** An American capitalist, died at Lake Geneva, Wis., July 18, 1916. Born at Berkshire, N. Y., in 1852, he became a bank clerk at Binghamton (N. Y.) at 19, and two years later settled in Chicago, where he was admitted to the bar in 1881. With his brother, Judge William H. Moore, he became identified with large business interests. The two got control of the Diamond Match Company and endeavored to corner the market, a proceeding that led to a panic and the closing of the Chicago Stock Exchange. Later they made a fortune in the National Biscuit Company, and bought up the Rock Island railway system. Four great steel corporations formed by them, with a combined capital of \$187,000,000 and known as the "Moore group," were finally absorbed by the United States Steel Corporation, in the formation of which the Moores were conspicuous. They also acquired large interests in the American Can Company. James H. Moore had a home at Santa Barbara, Cal., but his business address remained Chicago.

**MORAL EDUCATION.** See EDUCATION IN THE UNITED STATES.

**MORAVIA.** A crownland of Austria. For area and population, see AUSTRIA-HUNGARY.

**MORAVIAN CHURCH.** See MORAVIANS.

**MORAVIANS,** also called **MORAVIAN BODIES,** **UNITED BRETHREN** (Unitas Fratrum), and the **MORAVIAN CHURCH.** There are two bodies of this denomination in the United States, but only one which is important numerically. The smaller body is called the Union Bohemian and Moravian Church. It had in 1915, 1000 communicants, 21 churches, and 4 ministers. The main body, the Moravians, had in 1916, 20,569 communicants, 126 churches, and 145 ministers. Missions are maintained in nearly all parts of the world, and the educational institutions under the control of the Moravians have a high reputation for efficiency. The latter include the Moravian College and Theological Seminary, the Moravian Parochial School for Boys and Girls, and the Moravian Seminary and College for Women at Bethlehem, Pa., Linden Hall Seminary for Girls at Lititz, Nazareth Hall for Boys at Nazareth, Pa., and an academy for girls and a college for women at Salem, N. C. The Moravians are strongest in Pennsylvania.

**MOROCCO.** The largest of the Barbary states; an African sultanate under French protection by virtue of the treaty of March 30, 1912 (ratified without reservation by Germany in 1913), except for the area conceded to Spain, and Tangier, which is to be internationalized. The Spanish concessions cover an area of 21,800 square kilometers carrying a population of about 404,000; Tangier, 600 square kilometers, 60,000 inhabitants. The French protectorate has an area of 416,800 square kilometers and an estimated population of 3,000,000. Jews number about 150,000; Europeans (1910), 19,243. There are three capitals—Fez, with 102,125 inhabitants; Morocco (Marakech), 87,120, and Mequinez. Mogador, an important port, has

22,000 inhabitants: Casablanca (Spanish), 42,000; Tetuan (Spanish), 43,000; Rabat, 60,200; Tangier, 46,270. Berbers, Tuaregs, and Bejaouin and Mued Arabs are among the chief elements of the population; roving bands wage war among themselves and with their European rulers. Agriculture is undeveloped and the abundant mineral resources remain unexploited. Carpets and slippers are manufactured. The trade was rated for 1914 at £9,257,527 imports and £1,515,253 exports. Chief articles of export follow, with values in thousands of pounds sterling: Wool, 175,007; almonds, 101,535; linseed, 136,120; barley, 1692; fenugreek, 42,141; canary seed, 76,012; etc.

There are no authentic figures for Moroccan finance. The customs duties at the seven ports amount to about 12,500,000 francs. The sultan's budget is placed at about 7,000,000. The Sultan is an absolute spiritual and temporal despot. He and his subjects belong to the Malekite sect of the Sunnite Mohammedans. The reigning Sultan is Mulai-Yussuf, proclaimed at Fez Aug. 17, 1912, in place of his deposed brother, Mulai Abd-el-Hafid, who had succeeded another brother, Mulai Abdul, deposed in 1908. All are sons of Mulai Hassan (1873-1894). French resident commissioner-general, Gen. H. Lyautey, appointed April 28, 1912; Spanish high commissioner (at Tetuan), General Jordana, appointed July 9, 1915.

Toward the beginning of the year the French forces, under General Henrys, put down the movement of tribesmen in the Taza region, captured the camp of the leader Abdel Malek and drove him into the mountain region of Rif. General Jordana announced the complete overthrow of all hostile movements in the Spanish zone on May 17th, owing to the victory of Raisuli, Spain's ally, over the enemy. Fighting with the insurgents was reported to have recommenced in June, but by the end of the month the Spanish troops were said to have put down the revolt. Italy in March definitely renounced the privileges she had possessed under the capitulations in the French zone and in April took the same course in regard to the Spanish zone. The Netherlands and several other nations followed this example.

**MOSBY, JOHN SINGLETON.** An American Confederate soldier, died May 30, 1916, in Washington, D. C. Born in Powhatan County, Va., Dec. 6, 1833, he was engaged in the practice of law at the opening of the Civil War. Mosby enlisted in the First Virginia Cavalry, and by 1862 had become adjutant. His spare time was occupied in study of tactics and military history, and he became convinced of the value of raids upon the rear of the enemy. When a scout under Gen. J. E. B. Stuart, after an exploit in which he penetrated clear behind the Union lines, he gained permission to lead a band of guerrillas, known as Mosby's Partisan Rangers. With these he made as much trouble as possible for the enemy by cutting communications, destroying supply trains, and capturing outposts; and he came to be greatly feared by the Northern army, for it was never known where he would strike next. One of Colonel Mosby's most famous achievements was the cap-

ture, in March, 1863, of General Stoughton at his headquarters at Fairfax Court House, Va., where he was surrounded by his troops. Only 29 men accompanied him on this expedition. The next year, by harassing Sheridan's forces in the Shenandoah Valley, he prevented the cutting of Lee's communications with the South. By December, 1864, he had become colonel. At the close of the war, General Hancock refused to accept Mosby's surrender, on the ground that he was not properly an officer in the Confederate army, and it is said that if it had not been for General Grant's intervention, the famous raider would have been hanged. Mosby was one of the earliest Southerners to abandon animosity toward the North after the war. He became a Republican, actively supported Grant for President in 1872, and, by Hayes, was appointed consul at Hongkong in 1878. This post he held till 1885. Subsequently he was counsel for the Southern Pacific Railroad, a special land agent for the government in Colorado, and (1904-10) an assistant attorney in the Department of Justice at Washington. He wrote *Mosby's War Reminiscences and Stuart's Cavalry Campaign* (1887) and *Stuart's Cavalry in the Gettysburg Campaign* (1908).

**MOUNET-SULLY, JEAN.** A French actor, died in Paris March 3, 1916. He was born at Bergerac, Department of the Dordogne, Feb. 27, 1841. At 21 he went to Paris to enter the Conservatoire, against the wishes of his family, and there he studied under the great teacher Bressant, in 1868 winning the first prize in tragedy. In that year he made his debut at the Odéon, playing in *King Lear* with Mme. Sarah Bernhardt, without, however, any striking success. When the Franco-Prussian War broke out he was accepted as an officer in the Gardes Mobiles, and he so distinguished himself that he came near deciding on a military career. However, in 1872, he was offered the opportunity to play Orestes in Racine's *Andromaque*, at the Théâtre Français, at once gaining attention by his brilliant acting. From that time he was connected with this theatre, of which he became a *sociétaire* in 1874, and at the time of his death he was dean of the company. Mounet-Sully acquired a wide range of tragic rôles; his repertoire included plays by Sophocles, Racine, Corneille, Shakespeare, and Victor Hugo. Probably he will be longest remembered for his impersonation of Oedipus in a French version of *Oedipus Rex*, first produced at the old Roman amphitheatre at Orange in 1888. Afterward he played Hamlet, but with this he did not succeed in London, his interpretation (according to Jules Lemaitre modeled on Goethe's conception) failing to impress English audiences. Among the other notable parts that he took were Achilles in Racine's *Iphigénie en Aulide*, Xiphareas in *Mithridate*, Orosmane in *Zaire*, Hippolytus in *Phèdre*, the title parts in Victor Hugo's *Hernani* and *Ruy*

*Blas*, and Francis I in Hugo's *Le Roi S'Amuse*. The last named play had been banned 50 years before (1832) by Louis Philippe, but its revival gave Mounet-Sully one of the greatest triumphs of his career, as did the same author's *Marion Delorme*. During 1885 Mounet-Sully temporarily abandoned the stage, to lecture on contemporary French poets. In 1894 he appeared in repertoire in the United States, after touring through Europe. He wrote several plays, among them *La Vieillesse de Don Juan* in verse, presented at the Odéon in 1906. He was made an officer of the French Academy and a chevalier of the Legion of Honor. Mounet-Sully was accounted one of the greatest tragic actors of his day, equipped by nature with all the physical and mental attributes essential to powerful portrayal of character, and thoroughly trained in the art of the theatre.

**MOUNTAIN FEVER.** See **ROCKY MOUNTAIN SPOTTED FEVER.**

**MOUNT HOLYOKE COLLEGE.** A non-sectarian institution for the education of women, at South Hadley, Mass. It received its charter as a college in 1888, and before that had been Mount Holyoke Seminary. In the fall of 1916, 824 students were registered. The faculty numbered 96, and there was an additional staff of 50 administrative officers, etc. As substitute for Professor Hayes, of the department of psychology, who was granted leave for research work, Dr. Coffin came from Earlham College. During the year, by bequest and by gift, \$20,842 was received. The new Student-Alumnæ Hall, costing \$140,000, was opened. It contains auditorium, banquet rooms, committee rooms, etc. The productive funds of the college amount to \$1,419,251; the institution in 1916 drew an income of \$66,410. The number of volumes in the library was 61,212. President, Mary Emma Woolley. See **UNIVERSITIES AND COLLEGES.**

**MOUNT WILSON SOLAR OBSERVATORY.** See **ASTRONOMY.**

**MOVING PICTURES.** The year 1916 saw increasing development in the field of moving pictures. As always, statistics of the industry were difficult to obtain, and the ostensibly reliable statistics did not show any increase in the number of moving picture theatres in the United States. Even without the aid of statistics, however, it was evident upon slight investigation that the magnitude of the interests concerned and the amount of capital invested in the industry experienced an enormous increase. As an instance of the first portion of this statement it may be mentioned that in New York City, one well-known producer of motion pictures stated that there were 729 theatres for the exhibition of pictures at the end of the year. Another exhibitor, whose opinion presumably carried the same weight, stated before a legislative committee that had been authorized for the purpose of considering the taxation of the industry that there were only 530 such theatres in greater New York. This latter figure also was contrasted at this hearing with the effect that three years ago there were 1089 moving picture theatres in the greater city. It was still impossible to obtain, as above mentioned, the exact estimate of the amount of capital invested in the producing, distributing, and exhibiting divisions of the motion picture industry. In California alone, where, as is well known, owing to the climate and other local conditions, a large number

of producing studios were located, it was estimated that the sum of \$15,000,000 was invested in studios and apparatus. A noticeable tendency of the year was the gradual coöperation and combination of all those interested in the business into various associations. One of the largest of these, including all branches of the industry, was the National Association of the Motion Picture Industry. The need of some such bodies had been recognized for some time, but such a diversity of interests and tendencies had been shown, and so much money had been made by a few individual producers and companies that it had been difficult to bring them to the point of recognizing their common interests by the formation of an organization. Like other industries, the production and exhibition of moving pictures has been obliged to conform to the general principles of supply and demand, as well as to submit to the imposition of local laws and regulations, such as building and fire protection laws, regulations in regard to the admission of young children to the theatres, the question of censorship, and finally that of local taxation, which last is still in an unsettled state. Many of the exhibitors who could command only a limited amount of capital, or who had neither the ability nor foresight to discriminate in the choice of films or film plays, were unsuccessful financially. Thus a reduction in the number of theatres in many places was accounted for. At the same time also it should be noted that a larger amount of capital was invested in the exhibition of pictures than in the production or distribution of them. Formerly this was not so, since many of the more expensive film productions were shown on the screen in theatres that had been used for the legitimate drama. The small theatres usually were not able to afford the hiring of the better or more artistic class of films. As the number of productions increased, however, and an enlightened public taste began to make itself felt, a distinctly new class of theatre was built. Many houses of this type were designed without any regard to the possible future production of stage plays, thus giving evidence of the belief of the backers of such enterprises in the permanence of film plays. As was mentioned in the 1915 YEAR BOOK, the censorship of film plays was in an unsettled condition. Several States had boards of censorship, many more were legislating on the subject, and there was a pronounced movement on foot to obtain a national or Federal board of censors. This state of affairs in the industry at the beginning of 1916 continued practically throughout the year. While nothing was accomplished, the consensus of opinion among the producers and exhibitors was distinctly against censorship of any kind, on the ground that the activity of local police and other municipal officers would always be competent to deal with questionable or distinctly unmoral plays.

In looking over the progress of the year, one sees, as formerly, great variety in the quality of the plays which the public appears to enjoy. There was decided progress in the production of important dramas adapted for the screen, which will be referred to later on. In the average moving picture house, however, there did not seem to be any improvement in either the artistic quality or educational value of the average films exhibited. The same themes as formerly, carrying the same kind of appeal were shown

**MOVING PICTURE OPERATORS IN A FOREST OF THE VOSGES AT THE SCENE OF AN ARTILLERY DUEL**

**TAKING MOVING PICTURES FROM A TRENCH**  
French Official Photographs from Jacques Boyer, Paris  
**MOVING PICTURES IN THE WAR**

with unflinching regularity; and while many of them affected to excuse their existence by reason of a wholesome moral effect, it seemed unlikely that the effect, particularly on young persons, of many of the plays could be anything but bad. A play depicting the career of a criminal, for example, while it usually concluded with the bringing of the latter to justice, was so full of the antecedents of the principals, and the commission of the crime itself as usually to distract the attention of the young observer from the true end to be accomplished by it. The same criticism holds good with regard to the large number of film plays concerned with subjects that were of questionable expediency, particularly for exhibition before minors. Many of these so-called problem plays and others of that sort intended to teach some moral lesson, were not usually presented in such a form as to accomplish their object. It was for reasons of this sort that such a strong attempt was made to establish boards of censorship. At the meetings of the producers, the subject was discussed very fully, and naturally there was great difference of opinion; some of the members holding that they must give the public the kind of films that the public was supposed to demand; others again with different standards before them were earnestly endeavoring to raise the quality of screen plays through the improvement of subjects and in the methods of presentation.

One of the notable advances of the year was the improved photographic results obtained, many of the films depicting scenes that required considerable stretch of the imagination to understand as having actually taken place. Not only was more skillful photography observable, but considerable ingenuity was shown in the choice of scenes and surroundings. Earnest attempts were made to manufacture non-inflammable films, but while fires in moving picture theatres, due to this cause, were fortunately becoming quite infrequent, a thoroughly satisfactory non-inflammable film was yet to be produced.

Among the important dramas shown during the year was "Intolerance," produced by D. W. Griffith, which promised to have almost as successful a run as his "Birth of a Nation." Geraldine Farrar was featured in a film depicting events in the life of Joan of Arc, entitled "Joan the Woman." A film which attracted wide attention on account of dealing with the war topic was "Civilization," produced by Thomas H. Ince, and probably the most spectacular feature of the year was a screen version of Jules Verne's *20,000 Leagues Under the Sea*, which was considered a masterpiece of ingenious photographic technique. In spite of the war, exhibitions of moving pictures were held in many of the European cities. Some of the films were American, and others French and Italian. South American countries showed an increasing demand for amusement of this sort. In fact, in all parts of the world there came a gradual but certain recognition of moving pictures as a distinct form of amusement, entertainment, and education entirely separate from the spoken drama, which at one time it had been supposed would be displaced by the film.

The European war furnished increasing opportunities for photographing important campaigns and individual achievements that were subsequently used for moving picture exhibition, and not the least important of these was

a series of films depicting the work of the American Ambulance Corps in France. A number of these films were widely exhibited in the United States, not only for the purpose of showing the invaluable work performed by American volunteers in this hazardous branch of the service, but in order to arouse interest that would result in greater financial support to maintain it. Some excellent films were also obtained showing the operations of various kinds of aircraft. See also CHILD LABOR.

**MULRY, THOMAS M.** An American banker and leader in charitable work, died in New York City March 10, 1916. He was born in New York in 1856 and studied there at Cooper Union and at the De La Salle Institute. In 1871, after returning from some years in Wisconsin, Mr. Mulry joined his father in the contracting business, and with this he remained identified until 1906, when he was elected president of the Emigrant Industrial Savings Bank. He was also a trustee of the Mutual Life Insurance Company, and a director of the United States Title Guaranty Company. In addition he had been prominent in civic life, but although long identified with Tammany Hall, as a member of its general committee, he never consented to run for office. Mr. Mulry was principally known for his activity in various charitable organizations, Catholic and non-sectarian. He had been a president of the National Conference of Charities and Corrections, and a commissioner on the New York State Board of Charities, and was president of the St. Vincent de Paul Society. The Lætare medal of the University of Notre Dame was conferred on him in 1912, and Pope Pius X made him a knight of the Pontifical Order of St. Gregory the Great.

**MUNICIPAL GOVERNMENT.** In many American cities interest had shifted from the commission plan to the city manager plan during 1916 and the few years preceding. Meanwhile, the number of commission-governed cities continued to increase, although not so rapidly as before. A large percentage of the cities that had adopted the manager plan had coupled it with commission government, as was proposed in the model city charter of the National Municipal League (see YEAR BOOK for 1915). There was no official register of commission plan cities, and as this form of government had become an old story its adoption was not heralded as it formerly was. Much publicity was given to the adoption of the manager plan, but reporting it was voluntary. Moreover, there were differences of opinion as to just what constitutes a commission city or a manager city. All these things make it impossible to give complete lists of cities under the two plans. Tentative lists are presented, that for commission cities being a combination of a part of the data given in the INTERNATIONAL YEAR BOOK for 1913, 1914, and 1915, together with a list of 25 cities recorded by the National Municipal League as having adopted commission government in 1916. The commission plan list possesses unusual interest because it was 15 years since the plan was first adopted, in a primitive form, at Galveston, Texas, in 1901. The table includes 495 places, located in 41 States. In five of these States there are 30 or more cities listed, Texas alone having 53, Illinois 46, Kansas 43, New Jersey 37, and Pennsylvania 30. By years the adoptions have been as follows:

1901	1	1912	67
1905	1	1913	112
1906	0	1914	45
1907	7	1915	39
1908	5	1916	25
1909	23	Unknown	7
1910	66		
1911	96	Total	595

The cities reported as having voted for commission government in 1916 are as follows (for populations of these cities see the large table):

Allenhurst, N. J.	Salem, Ill.
Lambertville, N. J.	Ann Arbor, Mich.
Montclair, N. J.	Bessemer, Mich.
West Hoboken, N. J.	Green Bay, Mo.
Daytona, Fla.	East Aurora, Iowa.
Centralia, Ill.	Fredonia, Kan.
Chenoa, Ill.	Kearney, Neb.
Chrisman, Ill.	Mena, Ark.
East Peoria, Ill.	Roby, Texas.
Mt. Carmel, Ill.	Sinton, Texas.
Newton, Ill.	Butte, Mont.
Oregon, Ill.	Helena, Mont.
Olney, Ill.	

Presumably other cities adopted the plan in 1916 and doubtless some cities have found their way into the large table that do not belong there, but in round numbers it may be said that 500 cities or towns adopted the commission plan in the 15 years ended with 1916. The high-water mark was reached in 1913, when 112 cities were reported as having voted for commission government. Denver abandoned the commission plan early in 1916, as perhaps two or three smaller places had done at earlier dates.

The accompanying list of city-manager cities and towns includes 100 places, but comes down only to November, 1916.

In the latter part of the year two elections were held on a radical change in the charter of Springfield, Mass. At the first election the voters decided by 330 majority out of 10,912 votes for the Federal as opposed to the city manager plan. The second election was on the repeal of the old charter and the adoption of the Federal plan. The decision was for retaining the old charter, the majority being 2219 out of a total of 11,769 votes. Pasadena, Cal., decided by a small majority against having a city manager, but it already had commission government.

A Municipal Week was held at Springfield, Mass., late in November, with conventions of the National Municipal League, the City Managers' Association, and various other organizations.

**Bibliography.** New publications in 1916 included: H. L. Bain, *The Law and Practice of Municipal Home Rule* (New York); W. B. Munro, *Principles and Practice of Municipal Administration* (New York); C. P. Huse, *The Financial History of Boston* (Cambridge, Mass.); *General Statistics of Cities, 1915*, and *Financial Statistics of Cities, 1915* (Washington, D. C.); "The Purposes of the Indebtedness of American Cities, 1880-1912" (July issue of *Bulletins*, Bureau of Municipal Research, New York City). See also articles in this YEAR BOOK ON CITY PLANNING; GARBAGE AND REFUSE DISPOSAL; ROADS AND PAYMENTS; SEWAGE AND SEWAGE TREATMENT; WATER WORKS AND WATER PURIFICATION.

\* Commission-Manager Cities, according to classification of the Short Ballot Association, New York City.

**MUNICIPAL LEAGUE, NATIONAL.** The league was organized in 1894 for the study of municipal problems. On Dec. 15, 1916, its membership was 2638. The 22nd annual meeting was held at Springfield, Mass., November 23rd-25th, in conjunction with the City Managers' Association, the Massachusetts Civic League, the Training School for Public Service, and other organizations. A municipal research conference resulted in the formation of a separate organization to meet annually in conjunction with the league.

Among the important reports were those dealing with municipal courts (Harry Olson), sources of revenue (Robert M. Haig), franchises (Delos F. Wilcox), and the relation of the city to food supply (Clyde L. King). "Political Parties in City Government" was discussed by Charles A. Beard, A. R. Hatton, Richard S. Childs, Albert Bushnell Hart, and others. Among the speakers on "City Planning" were J. Horace McFarland, Nelson P. Lewis, Robert H. Whitten, and George B. Ford. The extension of municipal activities and municipal expenditures was discussed by Mrs. V. G. Simkhovitch, Allen T. Burns, and A. R. Hatton. Lawson Purdy, president of the league, spoke on "Some Advance Municipal Steps"; Clinton Rogers Woodruff, secretary, on "Municipal Preparedness."

Lawson Purdy was reelected president; Clinton Rogers Woodruff, secretary; and George Burnham, Jr., treasurer. Most of the vice-presidents, from different parts of the country, were also reelected. M. N. Baker was chosen chairman of the executive committee.

Prizes were awarded as follows: the Baldwin Prize, for the best essay on efficient billboard regulation, to Bernice V. Brown of Radcliffe College; the high school prizes, for the best essays on keeping highways clean, to Carroll Stansbury, Washington, D. C., and Virginia Crutcher, Pine Bluff, Ark.; the Portland Prize, for an essay on the unearned increment tax as a source of revenue for Portland, Ore., to Miss Clara Eliot of Reed College; the Hull Prize to Edward C. Mable of Dartmouth College, for his essay, "A Study of Municipal Accounting and Indebtedness in New Hampshire."

During the year two volumes were published in the National Municipal League series, *City Planning*, by John Nolen, and *Satellite Cities*, by Graham Romeyn Taylor. Three others were in course of preparation.

The league's official organ continued under the same general editorship, with Dr. C. C. Williamson of New York succeeding Dr. John A. Fairlie, and Miss Alice M. Holden of Vassar College succeeding Miss Adelaide R. Hasse, as associate editors.

**MUNICIPAL OWNERSHIP.** No marked

changes in the general status of municipal ownership occurred during the year 1916. New figures for the ownership of Canadian water-works are shown by the accompanying table. About 75 per cent of the works of the whole Dominion were municipally owned; 95 per cent in New Brunswick and 100 per cent in Manitoba and Saskatchewan. Quebec and British Columbia showed a heavy percentage of private ownership; but even in those provinces the percentages are under 50.

## OWNERSHIP OF CANADIAN WATER-WORKS

**MUNEO, ROBERT.** See GREAT BRITAIN, Government.

**MÜNSTERBERG, HUGO.** A German-American psychologist and author, died at Cambridge, Mass., Dec. 16, 1916. He was born at Danzig, Germany, June 1, 1863, graduated from Leipzig (Ph.D.) in 1885, from Heidelberg (M.D.) in 1887, and taught psychology at Freiburg in 1887-92. In the latter year he came to America and was appointed professor of psychology and director of the psychological laboratories at Harvard University, a position which he retained until his death. In 1910-11 he was Harvard exchange professor at the University of Berlin. Münsterberg was president of the American Psychological Association in 1898, vice-president of the International Congress of Arts and Sciences (St. Louis, 1904) and of the International Philosophical Congress (Heidelberg, 1908). He organized and was the first director of the America-Institut of the German government (1910-11), and was elected a fellow of the American Academy of Arts and Sciences. The first part of his professorial career was given chiefly to physiological psychology, but later he devoted himself to the psychological problems of everyday life and to questions of idealistic philosophy. His books dealing with the psychology of testimony, medicine, education, etc., were written in popular style and are of great service in correcting many prevalent misconceptions concerning those topics. More particularly his late writings on the psychological conditions of efficiency, especially the limitations of the human factor in industrial employment, attracted much attention to that subject. After 1903 he edited the Harvard Psychological Studies. In addition to his psychological work, Münsterberg sought to be an interpreter of American life and institutions to Germany and was also diligent in promoting the interests of his native country, especially after the outbreak of the European war in August, 1914. He was an outspoken defender of the German cause, and during the first

year of the war resigned his position at Harvard after the publication of an offer from Major Wiener in London, a former Harvard student, to bequeath \$10,000,000 to that institution if it would dismiss the professor. He was induced to recall his resignation, but the strong pro-Ally sentiment in his Harvard environment made his situation difficult, especially by reason of the estrangement of former colleagues with whom he had been closely associated. He fell dead when addressing a class. He wrote a large number of books, including: *Psychology and Life* (1902); *American Traits* (1902); *The Americans* (1904); *Eternal Life* (1905); *Science and Idealism* (1906); *On the Witness Stand* (1907); *Psychology and the Teacher* (1909); *Psychology and Industrial Efficiency* (1912); *Grundzüge der Psychotechnik* (1914); *Psychology and Social Sanity* (1914); *The War and America* (1914); *The Peace and America* (1915); and *To-morrow: Letters to a Friend* (1916).

**MURPHY, JOHN BENJAMIN.** An American surgeon, died Aug. 11, 1916, at Mackinac Island, Mich. He was born at Appleton, Wis., in 1857. His professional training was obtained at Rush Medical College, Chicago, from which he graduated in 1879, and at the universities of Vienna, Munich, Berlin, and Heidelberg during the years 1882-84. Entering practice in Chicago, he early became recognized for his achievements in surgery. He was appointed a lecturer at Rush Medical College, professor in the Post-Graduate Medical School (1890), in the College of Physicians and Surgeons (1892), and in the Northwestern University Medical School (1895). At Mercy Hospital, Chicago, where he was chief of the surgical staff, Dr. Murphy performed many of his operations, but he was identified with several other hospitals. His clinics were of the highest interest to other surgeons. He gained fame for his work as a bone "carpenter," for grafting cartilage, for an operation in which he manufactured a new jaw from metal and silver wire, for his nitrogen treatment of tuberculosis, and for his work in intestinal surgery. To fasten the ends of the intestines after a piece had been removed, he devised a metal ball known as Murphy's button, the success of which electrified the surgical world. Among many honors which came to him were: the Laetare medal, awarded to distinguished American Catholic laymen by the University of Notre Dame; honorary degrees from the University of Illinois and the University of Sheffield, England, the presidency of the American Medical Association (1911), membership in foreign societies, and the collar and cross of St. Gregory the Great, conferred at the direction of Pope Benedict XV. When Colonel Roosevelt was shot in Milwaukee in 1912, Dr. Murphy was called on to treat the wound. Some months before his death the surgeon had been a guest at a banquet to Archbishop Mundelein of Chicago, and had partaken of soup that proved to have been poisoned. He had not been well since, but his death was ascribed to heart disease.

**MUSEUMS.** See ARCHITECTURE.

**MUSIC.** GENERAL NEWS. The third year of the war saw an improvement of musical conditions, especially in France and Russia. Nevertheless, the number of foreign artists visiting the United States was still far above normal. In New York, the national centre of musical activity, the average number of important con-

certs was about 40 per week at the height of the season. The New Orleans Opera House, which had been badly damaged by the great flood and storm of the preceding year, was sold at public auction. It was bought and renovated by an unknown benefactor, and then presented to Tulane University; at the same time several public-spirited citizens raised a fund of \$1,000,000, to be administered by the university, for the maintenance of the opera house as a municipal institution. In the observance of the Shakespeare tercentenary celebration, music, naturally, played a very prominent part, and perhaps the most elaborate production in this connection was Percy MacKaye's gorgeous pageant, *Caliban by the Yellow Sands*, with music by Arthur Farwell, mounted in the Stadium of the College of the City of New York. Musical pageants, in fact, have come so much into popular favor within the last five years, that Yale University chose that form for the bicentenary celebration of its foundation in October. Not less than 7800 persons took part in this pageant, which was under the general direction of Francis H. Markoe ('06); all the music was specially written by members of the Yale faculty, William E. Haesche, David S. Smith, Horatio Parker, and Harry B. Jepson. In spite of the war neither England nor Germany neglected to observe the Shakespeare tercentenary with due solemnity. In England this occasion brought to light an enormous mass of incidental music written to almost every play of the great poet. The activity of German scholars unearthed from the dust of libraries an unknown violin-concerto in B $\flat$  of Haydn and a forgotten aria from Gluck's *Demetrio* (1742).

#### THE UNITED STATES

**ARTISTS. Instrumentalists.** The fact that many of the world's foremost pianists were concertizing in the United States did not deter many new artists from making their American debut, and a considerable number of these new aspirants for public favor met with striking success. Guiomar Novaes, a young Brazilian pianist scarcely out of her teens, took her audiences by storm through dashing brilliancy, variety of tonal color, sound musicianship, and astonishing maturity of conception. Albert Lortat, a Frenchman, exhibited not only the limpid technic, grace, and easy elegance characteristic of the modern French pianists, but aroused admiration by the boldness and grandeur of his conception, as well as the masterly and sympathetic interpretation of works of widely different styles; his recitals with J. Thibaud left no room for doubt as to his eminence as an ensemble-player. Enrique Granados, who had come primarily for the purpose of witnessing the world-première of his opera *Goyescas* at the Metropolitan Opera House, appeared in a few recitals, chiefly as an interpreter of his own works, and charmed through elegance and refinement; he evidently had a predilection for works of the modern impressionists. Mischa Levitzki, who had not yet reached his twentieth year, exhibited a poise and restraint very unusual in so young an artist; the maturity of his conception gave the impression that with him the intellect dominates everything, and that spontaneous impulse is a factor almost completely eliminated. Dorothy Berliner proved

herself a player of exquisite refinement and eminently poetic temperament. Carlos de Castillo, a Mexican, introduced himself as a formidable Liszt player of great brilliancy. Besides these newcomers there were a few pianists who had been heard before, but whose performances during the past year rose to an artistic level higher than had been attained before. Beryl Rubinstein, who ten years ago toured the country as a child-prodigy, returned from his European studies as a player of prodigious technic, which is rather too much in evidence as a quality exhibited for its own sake. Th. Henrion, a Belgian, who made a favorable impression the year before, showed that his tone had gained in beauty and variety of color. Before her appearances of the past year Margaret Volavay had been heard only with orchestra and in works of the extreme impressionists, so that it was impossible to arrive at a definite estimate of her real ability; her recent recitals revealed her as an artist of superb attainments. After an absence of nine years Richard Buhlig reappeared as a matured artist; he was most satisfactory in large works permitting the building of powerful climaxes; his touch is rather heavy for works calling for the subtler qualities. The sisters Rose and Otilie Sutro were heard with genuine pleasure in their joint recitals on two pianos, which form of concert-giving they have brought to such perfection that it is impossible to distinguish the individual performer; the effect produced is that of a single artist commanding a tone of extraordinary fullness. In respect to ensemble they surpassed even those two giants, Bauer and Gabrilowitsch, who also were heard in joint recitals; but each of whom preserved his individual style and touch. Leo Ornstein continued to play his own and other futuristic music, and seems to have found audiences that take him seriously; only in Chicago was he greeted with laughter. The playing of Teresa Carreño, who had not been heard for three years, caused a mild sensation. All the old-time fire, brilliancy, and virility were still there unimpaired; she still was the peerless "Valkyrie of the piano," holding her listeners under her magic spell; but there was also something new and undefinable, yet distinctly felt; some critics thought they discovered moments of unwonted tenderness, others spoke as though her art had become capable of subtler nuances, of greater variety and finer differentiation of tonal effects. Be that as it may, on one point all agreed: that the great artist was at the zenith of her powers. Of the other great pianists, most of whom have for years been recognized favorites, nothing new can be said; all were greeted by large and enthusiastic audiences. The list comprises the names of Ignace Paderewski, Josef Hofmann, Arthur Friedheim, Harold Bauer, Ossip Gabrilowitsch, Carl Friedberg, Rudolf Ganz, Ernest Schelling, Leopold Godowsky, Herbert Fryer, Harold Henry, Percy Grainger, Ethel Leginska, Germaine Schnitzer, Katharine Goodson, Yolanda Merö, Olga Samaroff, Fannie Bloomfield-Zeisler, Marguerite Melville-Lisznewska.

Among the violinists, the deepest impression was made by the young English artist, Isolde Menges. For her début she had chosen the Brahms concerto, a rather unfortunate choice, since she was not yet equal to the demands of this work, which taxes the powers of the greatest

interpreters. But in her subsequent concerts she proved herself an artist of fiery temperament, great personal magnetism, and facile technic. She draws a large and beautiful tone. Eddy Brown, a young American, was received with marked favor; he proved himself an artist of temperament and refinement. If Carreño surprised her admirers, Jacques Thibaud dumfounded all who had heard him before. He had securely established his reputation as a sterling artist, but no case comes to mind where such extraordinary development has taken place in so short a time. In December, 1914, his American tour was cut short by the death of his father, and after that he served a year in the army. The experiences through which he passed in that time must have made an indelible impression upon his mind and affected his whole conception of art. On his reappearance he revealed a breadth of conception and an emotional intensity of which his previous performances had given no intimation; from a player of charming elegance and refinement he has suddenly grown into one of colossal power. Theodore Spiering, formerly concert-master of the New York Philharmonic Society, and during the illness of Mahler its conductor, is not entirely unknown as a soloist, but the recitals that he gave during the past year disclosed such admirable qualities as a violinist and such solid musicianship, that it is a pity he is not heard more frequently. Other artists heard were Fritz Kreisler, Albert Spalding, Efreim Zimbalist, Mischa Elman, Anton Witek, Arthur Hartmann, Maximilian Pilzer, Kathleen Parlow, Maud Powell, Mary Zentay, Vera Barstow, Florence Austin.

A new Dutch violoncellist, Michael Penha, met with favor; he has a large tone and fine technic. Herman Sandby, formerly first 'cello of the Philadelphia Symphony Orchestra, resigned to devote himself entirely to the concert-stage; he was heard in numerous recitals and also in his own concerto, with orchestra. Other prominent violoncellists were Pablo Casals, Boris Hambourg, Paulo Gruppe, Alwin Schröder, Leo Schulz, Cornelius van Vliet. Quite unique were the recitals of the Spanish guitar-virtuoso, Miguel Llobet, who won much success with his splendid rendition of music written for his instrument.

*Vocalists.* Of the famous operatic singers, Frieda Hempel and Maude Fay appeared for the first time as Lieder singers; the former proved that she is equally mistress of the dramatic and lyric art, while the latter gave evidence of even greater powers on the concert stage than in opera. A most favorable impression was also made by Sophie Braslau, the young contralto of the Metropolitan Opera House, who won applause not only by her fine singing, but also by her versatility. Nina Dimitriev, in costume, gave recitals of Russian songs, preceded by a short talk explanatory of the characteristics of Russian folk-music, while Charlotte Lund devoted herself to the interpretation of Scandinavian songs. Craig Campbell, a Scotch tenor, scored a genuine success with his masterly rendition of German and French songs. Considerable interest was shown in the reappearance after many years of Susan Metcalf, now Mme. Pablo Casals; she was assisted at the piano by her husband, who proved himself a remarkably fine pianist. Something quite out

of the ordinary were the recitals of Ratan Devi, an Englishwoman married to a Hindoo, Dr. Ananda Coomaraswamy, who interpreted Hindoo rāgas and folk-songs. The doctor first explained the Hindoo musical system, after which his wife, in Hindoo costume and squat on a rug, sang the songs to her own accompaniment on the tamboura (a kind of lute with a very long neck). After an absence of several years Mme. Marcella Sembrich charmed her hearers as of old; her voice still maintains its beautiful quality, and as a queen of song she is still unsurpassed. The other artists that added lustre to a brilliant season were Julia Culp, Elena Gerhardt, Mme. Schumann-Heink, Margarete Matzenauer, Marcella Craft, Alma Gluck, Mariska Aldrich, Anne Arkadij, Marie Kuznietsov, Louise Homer, Tilly Koenen, Olive Fremstad, Jeannette Dufau, Clara Clemens Gabilowitsch, Frances Alda, Frances Ingram, Julia Claussen, Yvette Guilbert, John McCormack, Reinald Werrenrath, Louis Graveure, Arthur Middleton, Emilio de Gogorza, Evan Williams.

*ORCHESTRAS.* Largely through the efforts of Mayor James H. Preston, the Baltimore Symphony Orchestra, partly (\$6000) subsidized by the municipality, was established, and began its first season most auspiciously under Gustav Strube as conductor and J. C. van Huleteyn as concert master. To her first gift of \$100,000 for the pension fund of the Chicago Symphony Orchestra, Mrs. Elizabeth Sprague Coolidge added an equal amount with the request that the fund thus created be known as the "Albert and Nancy Sprague Memorial Fund" (in memory of her parents). Mrs. Coolidge's example was followed by other bequests for the same purpose, so that by the end of the year the fund had grown to \$237,500. An unnamed benefactor offered to pay in full any deficit of the Philadelphia Symphony Orchestra for the next five years, provided that within that time a guarantee fund of \$500,000 shall have been established, and that Leopold Stokowski be retained as conductor. The first season of the San Francisco Symphony Orchestra under its new conductor, Alfred Hertz, was very successful artistically; but before the end of the season dissension, which for a time threatened to disrupt the orchestra, broke out among the members of the association. The disaffected members organized the "People's Philharmonic Orchestra" under Nikolai Sokolov, and began with a series of popular concerts in July, the intention being to give regular symphony concerts during the winter. In the meantime the directors of the older organization had raised a guarantee fund and engaged new players in place of the deserters. Thus reorganized and strengthened, the orchestra began its second season under Hertz in October. The rival orchestra then changed its plans, and continued to devote itself, under a new leader, Max Bendix, to popular concerts. The New York Philharmonic Society (Josef Stransky) had planned a Strauss Festival in connection with the American première of the new Alpine Symphony, but owing to the non-arrival of the orchestral parts was compelled to change its plans. The festival, however, did take place on January 13th and 14th, when *Tod und Verklärung*, *Heldenleben*, and the finale from *Salome* were produced. This programme offered an excellent comparison of the composer's earlier and later style. At the end of the season the Philharmonic Soci-

ety and Oratorio Society (Louis Koemmenich) joined forces in a Bach-Beethoven Festival, producing the *Magnificat* and *Ninth Symphony*. Once more the Russian Symphony Orchestra experimented with the "clavier de lumière" (colored light keyboard) in the performance of Liadov's *Enchanted Lake*, but with no more convincing results than had attended the performance of Skriabin's *Prometheus* the year before. At one of its concerts the Minneapolis Symphony Orchestra gave Beethoven's *Triple Concerto* with the concert master Czerwonky (vl.), the first 'cellist van Vliet (vcl.), and the conductor at the piano—the first time in 14 years that Mr. Oberhoffer had been heard as pianist. The New York Symphony Society (Walter Damrosch) produced Brahms's *Double Concerto* with Fritz Kreisler and Pablo Casals. The Boston Symphony Orchestra (Karl Muck) abandoned its policy of selling the subscription seats for the Boston concerts by auction, and adopted a fixed scale of prices. In New York the Civic Orchestra under Walter Rothwell gave a very successful series of high-class concerts during July and August at Madison Square Garden; a Wagner-night drew such numbers that many people were unable to gain admission.

NOVELTIES. The Boston Symphony Orchestra (Karl Muck) brought out on January 1st Ernest Schelling's *Impressions from an Artist's Life* (variations on an original theme), a thoroughly impressionistic work of great rhythmical variety. A *Concerto* for violin and orchestra by the same composer was played by Fritz Kreisler (October 20th); it is rather a symphony with violin obligato than a real concerto. The San Francisco Symphony Orchestra (Alfred Hertz) produced Dukas's *Le Péri* (January 7th), a dance-poem in the composer's familiar style. Genuine surprise was caused by Stravinsky's *Symphony* in E $\flat$  (January 15th) introduced by the Russian Symphony Orchestra (Modeste Altschuler). Instead of the expected futuristic cacophony the work showed the influence of Wagner and Tchaikovsky, but never rose above mediocrity. At a concert of the New York Philharmonic Society (Josef Stransky) Maximilian Pilzer played a *Concerto* for violin and orchestra in D minor by Edmund Severn (January 7th), which proved to be legitimate, effective music. The Philadelphia Symphony Orchestra (Leopold Stokowski) brought forward the first novelty on February 4th, a *Concerto* for violoncello and orchestra in D, by Herman Sandby, and played by the composer. It was decidedly ultra-modern, but contained some effective writing for the solo instrument. At the same concert was heard Camille Zeckwer's symphonic poem *Sohrab and Rustum*, a strange mixture of genuine music and futurism; it suffered from prolixity and frequent anticlimaxes. On March 2nd the American premiere of Mahler's *Eighth Symphony* in E $\flat$  took place with eight soloists, a mixed chorus of 800, a children's chorus of 150, and the orchestra increased to 110. Like all the other symphonies of this composer, this one also suffers from the lack of sustained inspiration; beautiful portions alternate with dreary stretches; nor do the musical ideas justify the employment of such an enormous technical apparatus. Nevertheless, the outward success, due chiefly to the fine performance, was so complete that the work was repeated three times in Philadelphia, and the

entire company brought to New York (Metropolitan Opera House, April 9th). The novelty offered by the Chicago Symphony Orchestra (Frederick Stock) was H. Kaun's *Third Symphony* in E minor (March 13th), a very fine work built skillfully on splendid material. The New York Symphony Society (Walter Damrosch) presented V. Kolar's *First Symphony* in D (January 28th), strong, virile music in the established classical form. Elgar's *Polonia* (March 4th), constructed on three Polish themes, is very well written, but scarcely inspired music. Henri Rabaud's *Symphony* in E minor (November 24th) is one of the finest of modern French works; it is built on Franck's principle of the "generative theme"; though very modern, it is free from extravagance. Two other works heard at the same concert, Elgar's *Sospiri* and Sinigaglia's *Etude-Caprice*, proved insignificant. The Denver Philharmonic Orchestra (Horace E. Turemann) contributed a symphonic poem, *The Fall of Nokomis* (March 7th), by R. Bourk; it was very impressionistic, highly colored, and utterly formless. At its concert of March 2nd the American Symphony Orchestra of Chicago (Glenn D. Gunn) offered Cecil Burleigh's *Violin-concerto*, a melodious, natural work, and C. W. Cadman's *Night Scene* and *Intermezzo from An Indian Idyl*, in which characteristic and effective use is made of aboriginal melodies. Perhaps the sensation of the year, certainly the work awaited with the keenest interest, was reserved for the Cincinnati Symphony Orchestra (Ernst Kunwald). When the New York Philharmonic Society was obliged to announce the postponement of Richard Strauss's *Alpensymphonie* because the parts had not arrived, Dr. Kunwald and Mr. Stokowski began a rivalry for the première. The work was first produced by Dr. Kunwald on April 25th; three days later Mr. Stokowski played it; while Mr. Stransky did not present it until October 26th. The Cincinnati orchestra was increased to 135 players, and the outward success was emphatic. The New York performance took place under normal conditions, and permitted a calmer estimate of the real merits of the composition. Its reception by the audience was rather chilling. The work contains passages of great beauty by the side of others that are commonplace and even brutal, and the most beautiful parts were reminiscent of Wagner and of Strauss's own earlier works.

CHAMBER MUSIC. The sudden death of Edward J. de Coppet (q.v.), founder and supporter of the famous Flonzaley Quartet, caused serious apprehension as to the future of an organization which by many is regarded as unequalled anywhere. But all anxiety was soon set at rest by Mr. de Coppet's son André, who announced his intention of continuing his father's policy. During the year the Flonzaleys brought out a new quartet in C by Tanéiev which was received with indifference in Boston, but with decided approval in New York. On the occasion of their visit to Chicago it happened for the first time in the history of that city that the hall was completely sold out for a chamber music concert. The Kneisel Quartet introduced an octet for strings by Enesco, which was not altogether satisfying because frequently the composer aimed at orchestral effects foreign to the combination of instruments for which he was writing; yet, on the whole, it contained very fine music.

With the assistance of Rudolf Ganz they produced a new piano-trio in A minor by Ravel of very advanced tendencies, which found most favor in Boston. From the Saslavsky Quartet was heard the violin-sonata and the unfinished piano-quartet in B $\flat$  by Lekeu, both interesting chiefly as tokens of great promise by a young composer suddenly taken away in his prime. Their rendition of a string-quartet in E by V. Kolar disclosed a work of real merit. Emil Schmidt (1st vl.), Louis Angeloty (2d vl.), Emil Hahl (vla.), and William Schmidt (vcl.), all members of the Philadelphia Symphony Orchestra, organized a new string-quartet which met with gratifying success during its first season. The Kortschak Quartet (Hugo Kortschak, Herman Felber, Jr., Clarence Evans, Emeran Stoeber), founded the preceding year in Chicago, received a substantial endowment from Mrs. Elizabeth Sprague Coolidge. In Boston the Russian Music Society was formed by Ethel Frank (sop.), N. Oulukanov (bar.), Emmanuel Ondricek (vl.), Carl Webster (vcl.), and Alfred de Voto (pf.); their object is the propagation of Russian chamber music. The novelty contributed by the Margulies Trio of New York was G. Schumann's Trio in F, a work in strict classical form, well written, but of little originality. Among the many artists that appeared in joint recitals special mention may be made of Bauer-Casals, Macmillen-Schnitzer, Parlow-Hutcheson, David and Clara Manne, Edouard and Gaston Dethier, Thibaud-Lortat, Tourret-Decreux. Two concerts given for charitable objects attracted wide attention. Paderewski, Schelling, Stojowski, Muratore, the Flonzaley Quartet, and the Trio de Lutèce gave their services for the benefit of the musicians of the Paris Conservatoire, raising \$10,000. To the children of the Spanish composer Granados, who with his wife was lost at sea in the *Sussex* disaster (March 24th), the sum of \$11,000 was turned over as the result of a benefit given by Barrantos, Culp, McCormack, Paderewski, Kreisler, and Casals, the last three appearing in the Beethoven trio in B $\flat$ , op. 97.

**CHORAL SOCIETIES.** In Chicago the American Choral Society was formed with James Pugh as president and Daniel Protheroe as conductor. Its avowed object is the production exclusively of choral works by American composers, but for some reason not readily apparent the concert on Easter Sunday was devoted to the *Messiah*. The Musical Art Society of Chicago, founded in 1906 by Clarence Dickinson, reappeared after two years of inactivity, completely reorganized, under the conductorship of Herbert E. Hyde. It consists of a chorus of 40 trained professional singers, and has for its object the production of a *cappella* music, ancient and modern. In fact, it works along the same lines as the New York society of the same name under Frank Damroch. Another body spreading the appreciation of a *cappella* music is the Æolian Choir of Brooklyn under N. L. Norden, established three years ago. Their specialty is the cultivation of the music used in the Russian liturgy, and besides a number of minor concerts they gave during Easter week in New York an excellent rendition of an ambitious programme of works from 4-9 parts. The New York Oratorio Society (Louis Koemmenich) gave Haydn's *Creation* for the first time in 21 years, and proved that this work still possesses tremendous

Y. B. 16—18.

vitality. In the first season under its new conductor, Chalmers Clifton, the Cecilia Society of Boston gave the American premiere of d'Indy's *Chant de la Cloche* (Lay of the Bell), a work that attracted the first attention to the composer in 1886. The Schola Cantorum (Kurt Schindler) was not happy in the choice of its novelties. Deems Taylor's *Chambered Nautilus* proved rather anemic, and Stojowski's *Prayer for Poland* was very bombastic and pretentious, but devoid of all inspiration.

**FESTIVALS.** The second Newark Festival under the direction of Mortimer C. Wiske took place in 1916 as part of an elaborate and unusually impressive celebration of the 250th anniversary of the foundation of the city. During the four days of festivities the two prize cantatas, Franz Bornschein's *Onowa* and Carl Busch's *America*, were produced, as well as W. F. Harlinge's *The Miracle of Time*. Henry K. Hadley had written the music for the gorgeous pageant, and on the last day the festival concluded with a performance of Berlioz' *Requiem* by a chorus of 3000 and an orchestra of 250. At the 22nd Cincinnati May Festival under Dr. Ernst Kunwald Mendelssohn's *St. Paul's*, Beethoven's *Missa Solemnis* and *Ninth Symphony*, Pierné's *Children's Crusade* and Strauss's *Alpensymphonie* were produced; the critics described the rendition of all works as "superlative." The first part of the 16th Syracuse Festival was made the occasion of a celebration of the Shakespeare tercentenary. At the 11th Bach Festival in Bethlehem under F. J. Wollé the *Christmas Oratorio* and the *Mass in B minor* were performed in a manner characterized by the critics as "the absolute perfection of choral singing." The principal work brought out at the Norfolk (Conn.) Festival was Brahms's *German Requiem*. Absolute novelties were C. M. Loeffler's symphony in one movement, *The Mystic Hour*, a very complex modern work, and Percy Grainger's suite *In a Nutshell*, a combination of queer rhythms and strange experiments in orchestration. The 59th annual Worcester Festival offered works of far less interest than is usually the case. At the 20th Maine Festival held in Bangor and Portland under the direction of William Chapman a festival hymn, *Twenty Years*, composed by the conductor for the occasion, was sung; another absolute novelty was Bainbridge Crist's *The Parting*, for baritone and orchestra. At this year's festival (the 14th) of the Bohemian Club in Bohemian Grove, Cal., N. J. Stewart's *Gold* was received with such favor that the principal numbers were repeated at a special concert given a week later in San Francisco. The enormous success of the first open-air production of *Siegfried* at the Harvard Stadium the preceding year led to a repetition of the same work by the same artists (the Metropolitan company under Bodanzky) in Pittsburgh, Cleveland, St. Louis, and Indianapolis. Chicago also had arranged for this production, but at the last moment canceled the engagement "owing to the unfavorable weather," as officially stated. The real reason was the virulent agitation against everything German on the part of certain influential leaders of society. In none of the cities mentioned did the attendance fall below 10,000. Open-air performances of *Die Walküre* by the same company were given with immense success in New Haven (Yale Bowl) and New York (Sta-

dium of the College of the City of New York). Philadelphia had an open-air performance of *Aida* by the Italian artists of the Metropolitan company under Polacco. But also oratorios were performed in this manner for the first time. Louis Koemmenich gave Verdi's *Requiem* with a chorus of 1200 and an orchestra of 120 in New York (Polo Grounds), and Walter Damrosch conducted the *Elijah* with a chorus of 1200 and an orchestra of 165 in Boston (Braves Field).

OPERA. At the Metropolitan Opera House of New York 132 performances were given from a repertory of 37 works by 22 composers. According to nationality these were divided as follows: Italian, 16 works by 9 composers totaled 55 performances; German, 15 works by 8 composers totaled 50 performances; French, 3 works by 2 composers totaled 13 performances; Russian, 2 works by 2 composers totaled 10 performances; Spanish, 1 work totaled 4 performances. Wagner, represented by 8 works, led with 28 performances. Next in order came Puccini, of whom 4 works achieved 18 performances. Verdi ranked third, with 16 performances of 5 works. The works most frequently given were Wagner's *Lohengrin*, Verdi's *Aida*, Bizet's *Carmen*, Puccini's *Bohème*, and Borodin's *Prince Igor*, each 6 times. Four novelties were produced as follows: *Goyescas* (January 28th) by Enrique Granados, with Fitziu, Martinnelli, and de Luca in the principal rôles, under the direction of Bavagnoli, though received kindly, made no deep impression. Its chief distinction is the fact that it is the first Spanish opera sung in Spanish in the United States. The libretto provides very little of real dramatic interest and affords no opportunities for musical climaxes, while the music itself is of the modern impressionistic type, all atmosphere without real substance, and rather monotonous. The most striking portions of the score are the national dances, yet these disclosed no new traits or special Spanish characteristics; such typical rhythms have long been made familiar to American audiences through the far more effective music of Bizet, Massenet, Moszkowski, etc.—*Les Pêcheurs des Perles* by Bizet was chosen for the opening of the season on November 13th, with Hempel, Caruso, de Luca, and Rother in the principal rôles, Polacco conducting. Although the first two acts were given at the Metropolitan Opera House on Jan. 11, 1896, this was the first performance in America in its entirety, and, therefore, the real première in this country. It was splendidly performed, but made no impression; in it the future composer of *Carmen* shows none of his real power. The libretto is ineffective, even dull; certain numbers are charmingly melodious, but on the whole the music is superficial and lacks vitality. Moreover, the influence of Gounod and Meyerbeer is too much in evidence.—Of great, but purely historical, interest was the American première of Gluck's *Iphigénie en Tauride* (November 25th), sung in German by Kurt, Rappold, Sembach, and Braun, under the direction of Bodanzky. Scenically and dramatically the performance was perfect, but it was evident that even those great singers were no more in sympathy with that sustained, unimpassioned cantilena, than modern audiences with the musico-dramatic methods of the 18th century.—Zandonai's *Francesca da Rimini*, with Alda, Martinelli, and Amato, Po-

lacco conducting, was produced on December 22nd with very moderate manifestation of interest on the part of the audience. The book, arranged by D'Annunzio himself, is skillfully constructed, excepting the introduction of an actual battle-scene (act II) on the stage, which came dangerously near the ridiculous. The composer obtained some happy local color by the employment of old instruments (piffero, lute, and viola pomposa), and also wrote beautiful music on the few occasions where his music assumes some definite form. On the whole, the themes are vague and the harmonies ultra-modern, both lacking in expressiveness.—The revival of Götze's *Taming of the Shrew* (March 15th) in commemoration of the Shakespeare tercentenary was a most unfortunate choice. For the first time since 1890 Wagner's *Rheingold* found a place in the regular repertoire outside the Ring-cycle, and proved a powerful drawing-card. *Fidelio* was revived in Mahler's arrangement, and drew moderate, but appreciative audiences. The most important début was that of Maria Barrientos (January 31st in *Lucia*), who proved herself a coloratura singer of the first rank. Although her voice is very light, scarcely sufficient in ensemble, it is wonderfully schooled, very flexible, and of sympathetic quality. Her success was instantaneous and emphatic. Claudia Muzio, a dramatic soprano with splendid histrionic powers, also scored a decided success at her début in *Tosca* (December 4th). Genaro Papi, one of the chorus masters in former seasons, made his début as one of the regular conductors with Puccini's *Manon Lescaut* (November 16th). Mr. Gatti-Casazza's contract, which had expired, was renewed for four years more. Among the principal artists were Mmes. Gadski, Kurt, Alda, Destinn, Hempel, Rappold, Ober, Matzenauer, Homer, Farrar; Messrs. Caruso, Sembach, Urlus, Reiss, Martinelli, Goritz, Weil, Braun, de Luca, Amato, Botta, Didur; conductors, Bodanzky, Polacco, Bavagnoli, Papi.

The Chicago Opera Company introduced two novelties. Massenet's *Cléopâtre*, with Kuznietsov, van Dresser, and Maguenat in the chief rôles, Campanini conducting, was given on January 10th. It is more spectacular than any other of Massenet's works, but otherwise contained nothing new; the music is graceful, melodious, and pleasing, written with that consummate mastery of technic which characterizes all of Massenet's scores.—Simon Buchhalter's *A Lover's Knot* (January 15th), with Sharlow, Hamlin, and Marr in the principal rôles, under the direction of Charlier, met with a kind reception. The libretto is decidedly weak but the music, while not remarkable, is well orchestrated. Scarcely short of a sensation was the début of a new coloratura soprano, Amelita Galli-Curci, who took her audience by storm as Gilda in *Rigoletto* (November 18th). Whenever she sang on subsequent occasions, the house was sold out. Most emphatic, also, was the success of a new tenor, Giulio Crimi, and a baritone, Giacomo Rimini, who both made their début on the same night in *Aida* (November 13th) as Radamee and Amonasro, respectively. Among the more prominent artists of the company were Mmes. Fremstad, Raisa, Farrar, Claussen, Béat; Messrs. Dalmores, Muratore, Hamlin, Dufranne, Arimondi, Journet; conductors, Campanini, Pollak, Sturani, Charlier.

The Boston National Opera Company, organized by Max Rabinoff, gave a season of 35 weeks in 45 different cities with such success that the various guarantee-funds remained intact. While presenting no new works, the performances were everywhere praised for the excellence both of the individual artists and of the ensemble. Considerable interest was shown in the Japanese soprano, Tamaki Miura, who sang Cio-Cio-San in Puccini's *Madama Butterfly*. Most of the artists (Maria Gay, Maggie Teyte, Zenatello, Baklanov, Mardones, etc.), were well known as former members of the Boston, Chicago, Montreal, and Manhattan companies.—For the first time New York had a two-weeks' season of Spanish light opera with native artists (December).—At the Metropolitan Opera House in Philadelphia W. K. Grigaitis gave the first performance in America of a Polish opera, Moniuszko's *Verbum Nobile*, in Polish (February 28th) with amateurs in the principal rôles, a chorus recruited from the singers of five Polish churches, and a part of the Philadelphia Symphony Orchestra.—At Duluth Richard Kipling brought out for the first time in American a Norwegian opera, W. Thrane's *Fjeldeventgret* in the original language (May 17th) with such success that a movement was set on foot for the organization of a permanent company for the production of Scandinavian works.—On November 27th the Interstate Grand Opera Company gave its initial performance in Cleveland amid scenes of frantic enthusiasm. The opera was *Tristan und Isolde*, sung by Rachel Frease-Green, Eleonora de Cisneros, Karl Jörn, Franz Egenieff, and Henri Scott, under the direction of Ernst Knoch. Owing to gross financial mismanagement the company had to be disbanded before the end of the second week.—After only one week the Silingardi Opera Company came to grief in New Orleans. A strike of the orchestra was given as the cause of the disaster.

**BALLET.** Seldom have expectations been raised to such a high pitch as in the case of the famous "Ballet Russe," organized and managed by Sergei Diaghilev. Reports of its phenomenal success in Paris had reached this country, and much of the music written for it by the younger Russian and French composers had been heard here in concerts. The Metropolitan Opera House went so far as to reduce its regular season, in order to give its subscribers three full weeks of the ballet (April 3rd-29th, no performances during Holy Week). For the first time since the custom was established (1904) the usual Good Friday performance of *Parsifal* was omitted. The Ballet, headed by Messrs. Nijinsky and Bolm and Mme. Lopokova, made its debut at the Century Theatre in New York on January 17th, presenting four ballets: Stravinsky's *L'Oiseau de Feu*, Tchaikovsky's *La Princesse Enchantée*, Rimsky-Korsakov's *Soleil de Nuit*, and *Scheherazade*. After a two weeks' season, the company went on tour of various cities, returned to New York for the Metropolitan engagement, toured again, and concluded with a two-weeks' engagement at the Manhattan Opera House in New York (October 15th-28th). The repertoire consisted of about 25 ballets, many written specially for the company; others were arranged to music of Chopin, Schumann (*Les Papillons*), Weber (*Invitation to the Dance*), Rimsky-Korsakov (*Sadko*), Stravinsky (*Petrouchka*), and Richard Strauss (*Till Eulen-*

*spiegel*). *L'Après-Midi d'un Faune*, arranged by Nijinsky himself, was suppressed by the police when first given, but later, with Nijinsky in the chief rôle, it gave no offense. Much of the scenery was painted by Bakst and the actions were arranged by Fokine. For some of the ballets a young American painter, Robert Edmond Jones, a disciple of Reinhardt and an exponent of the "new manner," provided highly decorative settings. The excellent orchestra was first conducted by Ernst Ansermet, later by Pierre Monteux. Some music lovers protested against the use made of the works of Chopin and Schumann and certain Metropolitan subscribers complained because the regular opera season was curtailed.

#### EUROPEAN COUNTRIES

**GERMANY.** Of operatic novelties the most important was the new version of R. Strauss's *Ariadne auf Naxos* (Berlin, November 8th). The original version, as a sequel to Molière's *Le Bourgeois Gentilhomme* (Stuttgart, 1912; see YEAR BOOK) had met with so little success that the composer took the unanimously unfavorable criticism to heart and detached the opera from the play. The new version was received with unmistakable favor. At Dresden d'Albert's latest opera, *Die toten Augen*, had its première on February 27th. Its splendid and spectacular setting contributed largely to an outward success, which critics fear will not prove lasting, because the really beautiful portions are reminiscent of the composer's earlier works. In Berlin Teresa Carreño created a sensation by her performance at a single concert of Tchaikovsky's B minor, Chopin's E minor, and Liszt's E flat concertos. Aside from her wonderful physical endurance, the critics felt that at the age of 63 this remarkable artist is perhaps even greater than ever before. At the age of 68 Lilli Lehmann gave in Vienna a concert of Mozart's compositions to raise funds toward buying the master's birthplace.

**ENGLAND.** The season of opera given by Sir Thomas Beecham was unusually successful. Beside producing for the first time in English Puccini's *Manon Lescaut*, he also brought out two novelties by English composers. Stanford's *The Critic* (January 14th) was praised highly for its original and sparkling music; while Ethel Smythe's *The Boatwain's Mate* (January 28th), the text also by the composer, made little impression. Toward the end of the season (June) *Tristan und Isolde*, the first opera by a German composer since the outbreak of the war, was given; it was received with immense enthusiasm. In May the Leeds Choir and London Symphony Orchestra combined for a six-day Elgar festival, when Sir Edward's latest work, *The Spirit of England*, had its first performance and created a deep impression. At his well-known series of Concerts of Old Music Arnold Dolmetsch now appears dressed in the costume of the times of the composers represented on his programme. In January Vladimir de Pachmann was awarded the Beethoven medal of the London Philharmonic Society.

**FRANCE.** During the year the Opéra-Comique resumed regular performances, though the repertoire was limited by the small number of artists available; 28 French and four Italian operas were given, and even two novelties, Leroux's *Les Cadeaux de Noël* and Bruneau's

*Le Tambour*. The Grand Opéra, which up to November had given only single acts of various operas, gave its first regular performance since 1914 on November 4th, reviving Chabrier's *Briséis* (not heard since 1899). Saint-Saëns, upon his appearance at the conductor's desk to direct his *Samson et Dalila*, was greeted with storms of applause; whereas the Paris première of his oratorio *La Terre Promise* (first performance Gloucester Festival, 1913) made no impression.

**Bibliography.** **DICTIONARIES.** T. Norlind, *Allmänt Musik-Lexikon* (2 vols., Stockholm), an excellent, reliable work, especially valuable for biographies of Scandinavian and Finnish artists; H. Riemann, *Musiklexikon* (8th ed., Leipzig), enormously enlarged from the 7th ed. (1909), maintains its unique position as the most complete and serviceable musical dictionary published in any language.—**BIOGRAPHY.** H. O. Anderton, *Granville Bantock* (London), well written, much information in little space; E. M. Lee, *Brahms. The Man and His Music* (London), a sympathetic presentation of biographical facts and critical estimates; *Geraldine Farrar*, by herself, evidently written to gratify a feeling of personal vanity, contains little of permanent value; R. Rolland, *Handel*, English translation by A. E. Hull (London), one of the finest critical estimates of the master; W. C. B. Sayers, *Samuel Taylor-Coleridge, His Life and Letters* (London), very detailed, but panegyric and uncritical.—**THEORY.** E. Gariel, *A New System of Harmony* (New York; published simultaneously in Spanish), constructs a simple and eminently practical system upon four fundamental chords, giving numerous examples; P. Goetschius, *The Larger Forms of Musical Composition* (New York), a clear and scholarly treatise on the forms of the classical masters as the indispensable grandwork.—**ÆSTHETICS, CRITICISM, ETC.** G. Jean-Aubry, *La Musique française d'aujourd'hui* (Paris), a collection of excellent essays, especially of critical estimates of the work of Debussy, Fauré, Ravel, Chabrier, Dukas, d'Indy, etc.; E. M. Lee, *The Story of Symphony* (New York), a practical handbook for the serious amateur; D. G. Mason, *Great Modern Composers* (New York), well written, but mainly drawn from the author's earlier books; D. C. Miller, *The Science of Musical Sounds* (New York), very scholarly and detailed; O. G. Sonneck; *Suum Quique: Essays in Music* (New York), a collection in book-form of articles of permanent value, originally published in American and German journals; C. V. Sanford and C. Forsyth, *A History of Music* (London), embodies the latest researches of modern musical scholars, but too much space allotted to the early periods in proportion to that given to modern music; D. C. Taylor, *New Light on the Old Italian Method* (New York), advocates a return to the imitative process of the older teachers; C. van Vechten, *Music and Bad Manners* (New York), contains a fine essay on Spanish music, but is chiefly concerned with futuristic music.

**MUTUAL WELFARE LEAGUE.** See **PEN-  
OLOGY.**

**MUZIO, CLAUDIA.** See **MUSIC, Opera.**

**MYERS, HENRY L.** Relected Democratic United States Senator from Montana Nov. 7, 1916.

**NAPIER, ARTHUR SAMPSON.** An English

scholar, died near Oxford, May 10, 1916. Born in Cheshire in 1853, he studied at Rugby, at Owens College, Manchester, at Exeter College, Oxford (M.A.; D. Litt.), and at Berlin. For eight years he taught in Germany, as reader of English at the University of Berlin and as professor of English at Göttingen. Professor Napier served as Merton professor of the English language and literature at Oxford from 1885 till his death, and also as Rawlinson professor of Anglo-Saxon from 1903. He received honorary doctorates from Manchester and Groningen, and became a fellow of the British Academy. Besides works in German, and contributions to journals, both in English and in German, he published: *History of the Holy Rood-Tree* (1894); *Old English Glosses* (1900); *The Franks Casket* (1901); etc.

**NATAL.** An original province of the Union of South Africa. See **SOUTH AFRICA, UNION OF.**

**NATIONAL ACADEMY OF DESIGN.** See **PAINTING AND SCULPTURE.**

**NATIONAL BANKS.** Information regarding the Federal Reserve System will be found under **BANKS AND BANKING.** See also references given there.

**STATISTICS.** According to a summary of Comptroller of the Currency John Skelton Williams, the combined return of national banks on Nov. 17, 1916, showed aggregate resources of \$15,520,000,000. It was pointed out that these resources exceeded the combined resources of all the government and semi-government banks of the world. The increase in resources during two years was \$4,028,000,000 or 35 per cent. Total resources had doubled since the spring of 1906. The percentage increase in resources by geographical divisions during the past two years was as follows: New England States, 22; Eastern, 39; Southern, 32; Middle Western, 31; Western, 50; Pacific, 33; the increase in the New England and Eastern States was in total amount almost exactly the same as that for the rest of the country. It was significant, however, that the rate of increase throughout the southern and western parts of the country was unusually rapid; and particularly was this true of the Southern States. The principal item of resources was loans and discounts of \$8,345,000,000, an increase of \$1,112,000,000 from Nov. 10, 1915. The liabilities included capital stock of \$1,071,000,000 and an exactly equal amount of surplus and undivided profits. Deposits aggregated \$12,488,000,000; an increase during the year of \$2,332,000,000. This item constituted a striking evidence of the prosperity of the country and the basis for the growth of banking strength. The reserves on November 17 totaled \$2,472,000,000, or 124.78 per cent of demand deposits. The total was \$364,000,000 greater than on Nov. 10, 1915. National banks held specie and legal tender to the amount of \$788,000,000. The aggregate due from other banks was \$2,667,000 of which \$649,000,000 was due from the Federal reserve banks. The retirement of national bank notes continued: the circulation at the close of 1916 was approximately \$725,000,000, as compared with \$1,100,000,000 two years previous when the issue of Federal Reserve notes began.

Of the aggregate reserves above mentioned central reserve cities held \$585,000,000; other reserve cities, \$725,000,000; and country banks,

\$1,162,000,000. This revealed that reserves were widely distributed throughout the country, country banks holding nearly one-half of the total. This was a reversal of conditions which prevailed at the time of the panic of 1907. All classes of banks held a larger percentage of reserves than required by law, the total excess being \$1,016,000,000. This was the greatest surplus ever reported. So great was this excess that the section of the Federal reserve act which becomes operative Nov. 16, 1917, requiring national banks to hold their entire reserve either in their own vaults or with the Federal reserve system could have been made immediately operative with very slight disturbance.

**NATIONAL BIRTH CONTROL LEAGUE.** Beginning in 1914 an active propaganda to spread knowledge of birth control came conspicuously before public attention, when Margaret Sanger was arrested for publishing articles in favor of the use of contra-conceptives in her journal, *The Woman Rebel*. She was indicted under Federal law forbidding the sending of "improper matter" through the mails. Her trial, however, was repeatedly postponed until Feb. 18, 1916, when on the motion of the assistant district attorney the indictment was quashed in the Federal District Court at New York. Meanwhile her husband was indicted for distributing leaflets containing information regarding contra-conceptives and was convicted under the New York penal code. Mrs. Sanger was subsequently indicted again under the New York statute, as were also her sister and a nurse, all connected with a "birth control clinic" established at 46 Amboy Street in Brooklyn. Their trial was set for early in January, 1917.

Meanwhile persons interested had organized the National Birth Control League, the New York Birth Control League, and the Committee of One Hundred headed by Mrs. Amos Pinchot. Moreover, since a fundamental issue in these cases was a question of free speech and free press the Free Speech League headed by Leonard D. Abbott took an active interest in defending the accused. So widespread was the interest in these prosecutions that a group of distinguished men of letters in England, including William Archer, H. G. Wells, Edward Carpenter, Gilbert Murray, and others, joined in a letter to President Wilson urging the dismissal of the indictments.

Other cases included the arrest on February 11th of Mrs. Anna Goldman for orally advocating contra-conceptives in Yiddish in New York's East Side. This was the first case of arrest for oral propaganda of birth control to come before an American court. On June 6th at New York, Bolton Hall and Mrs. Max Eastman were arrested for distributing in Union Square a leaflet prepared by Mrs. Goldman at a meeting arranged by the Birth Control League. At Boston a youth named Van Kleeck Allison was arrested for publishing in *The Flame* an extract from one of Dr. W. J. Robinson's books dealing with birth control and for otherwise giving out such information. His defense was undertaken by the Boston Birth Control League. In a hasty trial he was found guilty and sentenced to three years in the House of Correction. Upon appeal, however, the sentence was modified to 60 days' imprisonment under circumstances which vindicated him from all moral obloquy. Meanwhile this case had resulted in numerous public meet-

ings and widespread newspaper discussion, thus carrying the propaganda to all parts of New England.

Outspoken opposition to the birth control movement was variously expressed by the leaders of the Catholic Church, and the July issue of the *Relief Society Magazine*, an official publication of the Mormon Church at Salt Lake City, contained the views of 5 of the 12 elders in the supreme council of that Church, also in strong opposition. The Catholic view as set forth by Father John A. Ryan (*The Survey*, vol. xxxv, p. 671) is that any use of contra-conceptive devices constitutes a grievous sin, being an "immoral perversion of a human faculty." Such practices are believed to be "opposed to order of nature" and "in the long run bad for the individual and the race." Any artificial limitation of reproduction is looked upon as tending to cultivate softness and unwillingness to undergo pain and self-sacrifice; as creating "an atmosphere of ease, egotism, and materialism"; and as destroying courage and virility. On the contrary leading physicians, preachers, professors, and social workers declared that birth control was a great step forward in the conscious direction of individual and social life, a necessity in the interest of reducing poverty and the procreation of defectives, and a powerful factor in the elevation of the happiness of marital relations.

A unique method of propaganda was the use of the drama and the motion picture. In November, 1915, was given the first presentation at the Maxine Elliott Theatre, New York, of a three-act play, "The Unborn," by Beulah Pointer. This resulted mostly from active agitation by the *Medical Review of Reviews*. Others supporting were F. K. Robinson, Mrs. O. H. P. Belmont, John Burroughs, E. H. Gary, Judge B. B. Lindsey, Rev. C. H. Parkhurst, James Speyer, and Ella Wheeler Wilcox. A motion picture drama, "Where are My Children?" was widely shown throughout the country and attracted wide publicity through the refusal of mayors at Boston and Philadelphia to prevent its presentation.

**NATIONAL CHILD LABOR COMMITTEE.** See CHILD LABOR.

**NATIONAL CIVIC FEDERATION.** The annual meeting of the Federation was held January 17-18 in Washington, D. C. Seth Low presided. Adequate military preparedness was urged by the following speakers: Mr. Low; Henry S. Breckinridge, Assistant Secretary of War; Senator Phelan, of California; Senator Wadsworth, of New York; Representatives Gardner and Roberts, of Massachusetts, and Kelley, of Michigan; Samuel Gompers, president of the American Federation of Labor; ex-Governor O'Neal, of Alabama; and Miss Maude Wetmore, national chairman of the woman's department of the Federation. Dr. Woods Hutchinson discussed industrial hygiene, August Belmont, workmen's compensation, Prof. Jeremiah Jenks, immigration, and John Hayes Hammond reported on a survey of social and economic changes in the last 30 years. In February, a committee on military and naval preparedness was appointed, with Henry L. Stimson as chairman. Louis A. Coolidge, as chairman of the welfare department, investigated more than 300 plans of profit sharing in the United States. In August, Dr. Thomas Darlington, sent to the Mexican border by the Federation, reported on hygienic conditions in the army. To succeed Seth Low (q.v.), who

died during the year, V. Everit Macy was elected president by the executive council to serve until the next regular meeting, Jan. 23, 1917. It was announced that this meeting would be largely devoted to a discussion of industrial and military problems growing out of the European war. In November a new committee, representatives of various interests, was formed to work for better laws relating to labor disputes.

**NAVAL PROGRESS.** In the YEAR BOOK for 1915 reference was made to the difficulty of obtaining accurate information concerning the navies of the warring powers owing to the secrecy maintained by the naval authorities. This secrecy was still preserved, and the record for 1916 is therefore one year further removed from definite knowledge of the naval affairs of the belligerents, particularly of their building operations. This was particularly true of Germany, Austria, and Russia and almost equally so of Great Britain and France. Of the Italian navy somewhat more was known. Nor were the losses definitely known. The table of "Vessels Lost" which appears on subsequent pages is approximately correct as far as it goes, but it is undoubtedly incomplete. The Germans and Austrians concealed their losses and injuries as far as possible and the British failed to report the German submarines destroyed by gunfire or caught in their submarine nets, unless the fact had in some way become public property, because they do not wish the Germans to know the date, manner, or place of destruction. There was reason to believe that at least one battleship (old type), one battle cruiser, and many destroyers and submarines of the German navy had been destroyed in addition to those given in the list, but confirmation of the various reports was lacking.

In Great Britain building operations were said to be proceeding with great rapidity, but there was no absolute evidence that construction work on individual vessels was being carried on at a very much faster rate than before the war. Of the five battleships of the *Royal Sovereign* class which were laid down between November, 1913, and January, 1914, all had not been reported as operating with the fleet, but they were probably

completed by the end of 1916. The other vessels under construction or completed were said to be as follows: 3 battleships of the *Royal Sovereign* class (24,500 tons, 23 knots, commenced, 1914); 1 battleship of the *Queen Elizabeth* class (27,500 tons, 25 knots, commenced, 1914); 5 battle cruisers of 32 knots (commenced, 1914); 3 battle cruisers of new design (naval features not disclosed, commenced, 1915-16); 70 new destroyers of 35 to 37 knots (1914-16); a large number of submarines (1914-16), some of which were of large size (*F* class of 1200 tons and *G* class of 1500). Among the most interesting types of British new construction were the monitors. They were of three sizes, the smallest carrying two 6-inch guns; the intermediate, one 9.2-inch and one 6-inch; and the largest, two 14-inch. The hulls, which had a very shallow draft, were protected by a cellular structure on each side, which was supposed to make them torpedo-proof. The monitors were used for in-shore and river work in places where the heavy ships could not go. Three small ones were purchased from Brazil at the outbreak of the war and many larger ones were later built. All were found useful in the attack of shore works and in defense against raids by light cruisers and torpedo craft; but their low speed and unsteadiness in rough water limited their effectiveness.

Of the condition of the German navy and its new construction there was very little direct information available in 1916, though occasional developments threw some light on the subject. The battle cruiser *Ersatz-Hertha* was launched on Aug. 2, 1915, and named the *Hindenburg*. She was, therefore, on the way for two years, or from 6 to 11 months longer than her predecessors. Apparently, this indicated a partial reconstruction on account of radical changes, or else a decreased speed in building. A few months later the Netherlands government received very favorable proposals from the Germania Works for the construction of two 7000-ton fast cruisers. It may therefore be concluded that the German shipbuilding establishments were not pressed with orders. Three battleships of the *T* class (29,000 tons, 8 15-inch guns) were under construction when the war broke out. Two at least should have been completed and the third may be. It was stated that in 1915 or earlier the Germans were considering battleships of 25 knots speed, triple bottoms, and carrying 8 16-inch guns in four turrets, and it was rumored that at least two had been commenced. Of the four battle cruisers building in 1914, the *Lutzow* and *Derfflinger* were completed and the former sunk in the battle of Jutland. As already stated, the completion of the *Hindenburg* was apparently delayed, though finished in time to take part in the Jutland fight. Perhaps the *Ersatz-Victoria Luise* may have fared better. There was not even a rumor that Germany had begun any battle cruisers since the war began, but of course she had probably done so. She was, however, said to be building several fast cruisers and some commerce destroyers which she hoped to get past the British blockade. In addition to the vessels of improved *Graudenz* type, the *Neue Zuercher Post* described submergible cruisers of 5000 tons (submerged) carrying medium calibre guns in a turret, and having a cruising radius of 18,000 to 20,000 miles (see BATTLESHIPS AND OTHER WAR VESSELS). According to the same

authority, the latest German submarines had a submerged displacement of 2400 tons, double hulls, and a speed of 22 knots on the surface. To augment the strength of the German naval forces operating in the Baltic, some of the old cruisers and coast defense ships (*Egir* class, 4000 tons, armored) were fitted along their sides with coffer-dam defense against torpedoes. There were numerous conflicting reports as to the building of destroyers and torpedo boats, but undoubtedly many had been completed and many others were building at the end of the year.

Since the outbreak of the great war the French navy had not, so far as known, begun any battleships or battle cruisers. The building of the four battleships designed to carry 16 13.4-inch guns was deferred until after the war; and, although a study had been made of battle cruiser design, none of this class had been laid down. Apparently the French thought that their British allies had the naval situation well in hand and that they best could apply their own energies and funds to land operations. While no battleships had been commenced and the carrying out of the regular building programme had been deferred, the *Moniteur de la Flotte* is responsible for the statement that a motor battleship was to be laid down. The engines were to have a horse power of about 18,000 and the speed was to be "moderate." The displacement was not stated nor was the number of guns given, but they were to be mounted in 4-gun turrets. Up to the end of 1916 the ship building facilities had been confined to work on the five battleships of the *Flandre* class, 24,800 tons, 12 3.4-inch guns), completing the *Lorraine*, *Bretagne*, and *Provence* (23,000 tons, 10 13.4-inch guns), which were said to be ready for service, and some new destroyers and submarines. While the French navy had a large number of destroyers, they were mostly small (all but 18 were less than 460 tons), so that larger and more seaworthy boats were needed, and some were said to be in hand. As in other navies, many old ships which were practically discarded were repaired and put in service for special work. The commissioning of reserved and other vessels had brought the personnel of the navy up to about 100,000.

All of the war vessels building for the Russian navy at the outbreak of the war were completed, with the exception of two fast cruisers of 7085 tons, and these may have been finished also. About 30 large destroyers had been completed since 1914 and it was believed that a still larger number were under construction. Like the other warring nations, Russia had completed many submarines since 1914 and was building others; of these 150 were transportable boats of about 60 tons, and the others were from 500 to 1000 tons. The Russian navy received doubtful reinforcement by the purchase of three of her old vessels which were captured by Japan; these were the battleships *Tango* (ex-*Poltava*) and *Sagami* (ex-*Peresviet*) and the protected cruiser *Soya* (ex-*Variag*). The sum paid was \$7,750,000. Unfortunately, the *Peresviet* was wrecked in a fog a few days after being taken over. Another and greater loss to the Russian navy was the new dreadnought *Imperatrissa Maria*, which caught fire near one of her magazines, blew up, and sank. As she lay in very shoal water, and the explosion involved only the vicin-

ity of one of the magazines, it was thought she could be raised and repaired.

All of the vessels building for the Italian navy in 1914 had been completed by 1915, with the exception of four battleships (30,000 tons, 25 knots, 8 15-inch guns) which were commenced in the spring and summer of that year. The new vessels which later were commenced comprised 3 large destroyers, or flotilla leaders, of 1500 tons; 19 submarines; and some auxiliary vessels. The Italian navy was very unfortunate in the war. It had not only failed to inflict serious loss upon the Austrians, but it had two armored cruisers sunk, and two of its battleships—one of them its latest dreadnought—were blown up by accident. These two explosions were not explained. The Italian ammunition was of the same type as the British. Great Britain had lost one battleship, one armored cruiser, and one auxiliary cruiser by similar explosions, and unofficial reports laid the blame on careless handling of ammunition. And, as stated in the preceding paragraph, the Russian dreadnought *Imperatrissa Maria* was destroyed on Oct. 20, 1916. Whether the quality of her ammunition had anything to do with the matter is not yet established.

According to the Japanese press there were five superdreadnoughts built or building in Japan in 1916, and the navy was to request authority to build three more in the next seven years. The programme was also said to include two battle cruisers which were to be completed within the same period. The superdreadnoughts were four vessels of the *Fuso* class (30,000 tons, 22 knots, 12 14-inch guns) and one new battleship of 32,000 tons (23 knots, 12 15-inch guns). Of the *Fuso* class, only the *Fuso* was completed, but the others were well advanced and one was nearly ready for service at the end of the year. The new ship of 32,000 tons, the *Nagato*, was commenced in the spring of 1916. It was expected to lay down one more vessel of this class each year (1917, 1918, 1919). The battle cruisers were likely to be deferred until all of the *Fuso* class were completed. These were to surpass in speed the German *Hindenburg* and, while slower than the American battle cruisers, were to have greater gun power. Two or more fast light cruisers of about 5000 tons were to be taken in hand, also several more destroyers (two at least were building in 1916) of about 1200 tons, resembling those of the *Urakaze* type, previously placed in commission. Some of the submarines contemplated were to be large enough for deep-sea voyages and have a cruising radius of at least 4000 miles.

With the exception of the miscellaneous activities of its small cruisers, torpedo boats, destroyers, submarines, and air craft the Austrian navy did not engage in any operations. Four new dreadnought battleships of 24,500 tons were to be laid down in 1914-15, but comparatively late reports stated that none of these had been commenced. It was quite certain, however, that the last battleship of the *Viribus Unitis* class (20,000 tons) was completed soon after the war broke out. Three fast light cruisers of about 4800 tons were to be laid down in 1914-15. One (*L*) was said to have been completed, one (*K*) was destroyed at Monfalcone, and one was thought to be under construction and nearly finished in 1916. Three fast light cruisers of 3600 tons and 32 knots speed were

building at Monfalcone in 1914 for the Chinese navy. As all three had been launched before the Italians took possession it was probable that they were taken over by the Austrian navy, towed elsewhere, and then completed. One destroyer of 400 tons, building for China at Trieste, and two submarines of 320 tons, building for Holland at Fiume, were taken over by the Austrian government at the outbreak of war.

The greatest relative change in the constructive plans of any navy was made in the United States. The Naval Act of 1916 appropriated about \$315,000,000 and provided for a very large constructive programme, as follows: 10 battleships of the largest and most powerful type; 6 battle cruisers to have an armament as powerful as any of their class, and to have the highest practicable speed, and the greatest desirable radius of action; 10 scout cruisers and 50 torpedo boat destroyers of the highest practicable speed and greatest desirable radius of action; 9 fleet submarines, 58 coast submarines, and 1 equipped with the Neff system of submerged propulsion; 3 fuel ships; 1 repair ship; 2 destroyer tenders; 1 fleet submarine tender; 2 ammunition ships; and two gunboats. The act also extended the authority and duties of the chief of operations and he was made the head of the new bureau of operations in the Navy Department. As organized this practically formed a naval general staff and was the greatest advance made in recent years in the preparation of the navy for war. The reserve force of the navy was entirely reconstructed by the act and consists of (1) the Fleet Reserve, composed of officers and men who have served in the navy; (2) the Naval Reserve, those who are or have been engaged in the sea-going profession and have qualified for service on fighting ships; (3) the Naval Auxiliary Reserve, those of the sea-going profession whose knowledge and experience fit them for duty on the navy auxiliaries; (4) the Naval Coast Defense Reserve, those capable of performing useful service in the navy in defense of the coast; (5) the Volunteer Naval Reserve, those eligible to serve in any of the foregoing classes but who obligate themselves to do so without retainer in times of peace; (6) the Naval Reserve Flying Corps, those transferred from the Naval Flying Corps. The act also established the Naval Flying Corps, reorganized and improved the standing of the Naval Dental Corps, fixed the total number of officers of all corps at 4 per cent of the enlisted

strength as provided by law, and also the proportionate number of officers in all grades and corps. The total personnel of the navy was fixed at 3000 officers and 75,000 men. The act also allotted \$8,000,000 for the further equipment of navy yards for ship building.

Of the vessels mentioned in the foregoing paragraph, the following were to be laid down at once, the others before July 1, 1919: 4 battleships, to cost not more than \$11,500,000 each, exclusive of armor and armament; 4 battle cruisers, cost not to exceed \$16,500,000 each, exclusive of armor and armament; 4 scout cruisers, limit of cost \$5,000,000 each, exclusive of armor and armament; 20 destroyers, limit of cost, \$1,200,000 each, exclusive of armor and armament; 3 coast submarines of about 800 tons, limit of cost, \$1,200,000 each; 27 other coast submarines, limit of cost \$700,000 each; 1 Neff submarine of about 150 tons, limit of cost \$250,000; 1 fuel ship, limit of cost \$1,500,000; 1 hospital ship, limit of cost \$2,350,000; and two ammunition ships, limit of cost \$860,000 each. The amount of money actually appropriated by the bill, \$59,000,194, was allotted for hulls and machinery of vessels authorized, \$4,110,000 for armor and armament, and \$19,485,500 for ammunition supply.

The new battleships were to be of 32,600 tons, 21 knots speed, and to carry eight 16-inch guns. The scout cruisers were to be of 7100 tons, 35 knots speed, and carry eight 6-inch guns. The destroyers were to have a displacement of 1185 tons, a speed of 35 knots, and carry four 4-inch guns. The characteristics of the armored cruisers were not fully settled, but it was understood that they would be very large, carry 16-inch guns, and have a speed of 35 knots. Details in regard to submarines were not published. For number and tonnage of vessels built and under construction, see table.

Of the minor naval powers the Netherlands were building 2 fast cruisers of 7000 tons and 30 knots speed; and 4 submarines of 836 tons and 17.5 knots. Portugal was building 2 gunboats, 2 destroyers, and 3 submarines. Spain had 2 battleships under construction (1 was nearly completed) and had a building programme of 4 fast cruisers, 6 destroyers, 28 submarines, 3 gunboats, and 18 coast guard mine layers. Some of these were under construction and a few were completed; one submarine was built in the United States and finished about the end of 1916.

195 ships = 437,007 tons.

147 ships = 294,368 tons.

\* Exact numbers and tonnage unknown; figures given are based on the best information available.

(a) Details of design not yet settled.

(b) To be commenced as soon as practicable.

Vessels 20 years old (unless recently rebuilt) and of less than 1,500 tons (exclusive of torpedo craft) are not included. Tonnage of United States submarines omitted in deference to wishes of the Navy Department.

NAVAL OPERATIONS IN 1916. The naval operations and incidents of the year were not, aside from the battle of Jutland, particularly noteworthy. The British fleet continued to give the world a shining example of the value of sea power by shutting off Germany from all sea-borne supplies except the small quantities which occasionally came across from Norway and Sweden, and even this traffic was almost stopped. The prevention of import of cotton, copper, rubber, zinc, tin, petroleum, and foodstuffs greatly hampered the Central Powers in the production of munitions of war, and it is probable that it seriously interfered with their military operations and affected the spirits of the people and to some extent the morale of the troops.

The German submarine war against commerce was much modified early in the year, and later, while the German government took up a new and indefensible attitude towards neutral ship-

ping, very little effort was made to carry out its declarations. A very considerable portion of the Germans were beginning to have doubts of the advisability of ruthless submarine war against non-combatant shipping. First, it did not appear to have achieved its end—the destruction of the enemy's commerce and very serious curtailment of his supplies of food and munitions of war; and secondly, it was very costly of life and vessels in the submarine service. According to some authorities the Germans had lost 150 to 175 submarines up to July 1, 1916. Others placed the loss lower, but all seemed to agree that the submarine warfare had been carried on at a tremendous cost of men and vessels. The following tables show the number of merchant vessels sunk, or otherwise destroyed, between Aug. 1, 1914, and June 1, 1916. It does not include captures, seizures, or intern-

From later reports it appears that 36 of the merchantment belonging to belligerents and 15 belonging to neutrals were eventually refloated or otherwise saved and carried into port for repairs.

The last serious incident of 1915 was the loss of the British armored cruiser *Natal*, which was destroyed on December 30th by an internal explosion while at anchor in a British port. The cause was not revealed, but rumor stated that this accident, like those which caused the destruction of the *Bulwark* and *Princess Irene*, was due to the careless handling of high explosive shell. The Italian and Russian navies used similar ammunition. The former had lost the battleships *Benedetto Brin* and *Leonardo da Vinci* and the latter the battleship *Imperatrice Maria*, all by explosions while at anchor in port. The causes of the accidents were not given out.

The first naval operations in 1916 were connected with the evacuation of the Gallipoli Peninsula and giving up the badly planned and worse conducted Dardanelles campaign. The evacuation was completed with little loss on January 8-9, 1916. It is a noteworthy fact that 49 hospital ships were employed in connection with the Dardanelles operations.

The first notable incident in North Sea-Baltic operations was the loss of the British battleship *King Edward VII* (16,350 tons), which was sunk by a mine on the east coast of England on January 9th. On January 28th, the British government announced a general control of the whole British merchant marine. On February 2nd, the fast cruiser *Arctusa* was sunk by a mine off the English coast. During the latter part of the month, the Germans planted mines on the British coast between Folkestone and Dover and three large steamers were sunk by them.

On February 29th, the British auxiliary cruiser *Alcantara*, cruising north of Scotland, hailed a vessel with Norwegian colors painted on her side, apparently a Norwegian merchantman. The challenged ship proved to be the German auxiliary cruiser *Greif* (of about 10,000 tons) and she immediately opened fire. In the fight which ensued the *Greif* was sunk by the

guns of the *Alcantara*, but just before going down she discharged a torpedo which sank her opponent. The *Alcantara* was formerly a merchant steamer of about 16,000 tons.

On March 5th, the German auxiliary cruiser *Moeve* passed safely through the British blockade to a German port. In two months she had captured and destroyed 1 French, 1 Belgian, and 12 British vessels. One other British steamer, the *Appom*, was sent to the United States with the crews of the vessels destroyed. It is presumed that the *Greif* was designed for the same class of work as the *Moeve* and was endeavoring to get to sea when she met the *Alcantara*.

On March 20th, a British submarine in the Baltic captured a merchant vessel and sent it into port in charge of a small prize crew. On the same date there was an engagement between four British and three German destroyers. The latter escaped into Zeebrugge without serious injury. Between March 23rd and March 27th a British expedition scouting along the German coast met the German scouts. The old British cruiser *Medusa* was sunk, also one German destroyer.

On April 25th, a German scouting expedition, consisting of several battle cruisers, fast light cruisers, submarines, and destroyers, appeared off Lowestoft and Great Yarmouth, on which they opened fire. After about 20 minutes' firing, in which no great damage was done, they retired to the eastward. This expedition was probably designed to locate the British battle cruiser squadron and to see if any of the British battle fleet was in the vicinity. During April 23rd-24th, the British monitors, cruisers, destroyers, and other vessels and aircraft operating along the Belgian coast, bombarded the German destroyer and submarine base at Zeebrugge and the German batteries at Heyst, Blankenberghe, and Knocke. According to reports from Amsterdam the firing did enormous damage, especially at Zeebrugge. On April 27th, the German submarine *UC-5*, built and used as a mine layer, was captured.

In May, previous to the 31st, no operations of importance took place, but on that day occurred the greatest naval battle of the war. The Germans state that their high seas fleet was cruising in the Skager-Rak for the purpose of offering battle to the British, as they had done on previous occasions. Their force consisted of five battle cruisers of the *Derfflinger* and *Moltke* classes (presumably the *Lutrow*, *Hindenburg*, *Derfflinger*, *Seydlitz*, and *Moltke*), three battle squadrons (17 dreadnoughts, 8 pre-dreadnoughts), a number of fast light cruisers and several destroyer flotillas. The battle cruiser squadron was commanded by Vice-Admiral von Hipper, the high seas fleet by Vice-Admiral von Scheer. The British force, which was making one of its periodical sweeps through the North Sea, consisted of: (a) the fast battle fleet under Vice-Admiral Beatty, composed of the battle cruisers *Tiger*, *Lion*, *Princess Royal*, *Queen Mary*, *Indefatigable*, and *New Zealand*, the 5th battle squadron (Rear-Admiral Evan Thomas) of four fast battleships (*Barham*, *Valiant*, *Warspite*, *Malaya*—25 knots), and several fast light cruisers and squadrons of destroyers; (b) the main fleet under Admiral Jellicoe, composed of about 25 dreadnought battleships, the third battle

cruiser squadron (Rear Admiral Hood) of 3 battle cruisers (*Invincible*, *Inflexible*, *Indomitable*), an armored cruiser squadron (Rear Admiral Arbuthnot) of 4 old armored cruisers (*Black Prince*, *Duke of Edinburgh*, *Defence*, and *Warrior*), and numerous fast light cruisers and destroyer flotillas.

On the afternoon of May 31, 1916, Vice-Admiral Beatty with his command, was scouting ahead of the main force of the grand fleet and about 50 miles south of it, his light cruisers in advance. At 2.20 P. M. the light cruiser *Galatea* reported the presence of the enemy and at 2.35 considerable smoke to the eastward was seen from the flagship. Beatty turned to the east and then northeast, being satisfied that the enemy was northeast of him. About 3.30 he formed his battle cruisers in column, heading ENE, with 2 destroyer flotillas ahead, and increased his speed to 25 knots. The fifth battle squadron was on his port beam, about 10,000 yards away, and two light cruiser divisions were scouting ahead of it. At 3.31 the enemy, consisting of five battle cruisers, some light cruisers, and several torpedo flotillas, was sighted heading about SSE. Beatty changed course to ESE, converging on the course of the enemy now about 23,000 yards away. At 3.48 both sides opened fire at a range of about 18,500 yards. The wind was light from NW, and the sea was smooth, but the weather was misty and visibility of distant objects not good, especially to the southeast. Upon reaching a range of 14,500 yards, Beatty turned to the southward, laying a course parallel to the enemy. About 4 o'clock, an explosion took place on the *Indefatigable*, the last ship in Beatty's battle cruiser column, and she quickly sank. At 4.08 the fifth battle squadron (Thomas) opened fire at about 20,000 yards. At 4.15 both British and German destroyers moved out to attack. The Germans were driven back and the British pressed forward to attack the German battle cruisers. In this operation the *Nestor*, *Nomad*, and two German destroyers were sunk. About 4.30, following an explosion on board, the *Queen Mary* sank. At 4.42 the main German fleet was sighted ahead approaching from the southward. Beatty then countermarched and headed NNW at full speed, the fifth battle squadron following the battle cruisers. This brought them quite close to the German main fleet which was coming up rapidly. Von Hipper countermarched his column immediately after Beatty. Between 5 and 6 o'clock the Germans were more or less obscured by the mist. About 5.45 the British destroyers again attacked, but the Germans say that no damage was inflicted. An unofficial report states that at this time only four German battle cruisers were in Hipper's column. Beatty gradually drew ahead after turning, but when he reached 1400 yards he turned slightly towards the eastward and the Germans did the same. At 5.56 Beatty sighted the leading ships of the main British fleet bearing north. He then turned more to the eastward and reduced the range to 1200 yards. Only three battle cruisers were left in the German battle cruiser column at this time. The leading ships of Jellicoe's force were the armored cruisers division under Arbuthnot and the battle cruiser division under Hood. The latter was directed to report to Beatty and formed in column ahead of Beatty's

flagship (the *Lion*). As Hood was getting into position the armored cruisers *Defence* and *Warrior* were seen passing between the British and German fleets under heavy fire. While driving off a torpedo attack and destroying the German light cruiser *Wiesbaden*, they sighted the German main fleet advancing through the mist. The *Defence* was sunk but the *Warrior* was temporarily saved by the battleship *Warspite*, whose steering gear had jammed and carried her out of her column. Before she got under command she sustained a hot fire at close range from several German battleships but she made a spirited fight and got away. At 6.20 Hood was only 8000 yards from the nearest German ship and a few minutes later the *Invincible* sank. The main British fleet had formed in column and was now following Beatty's vessels. The flagship *Marlborough* was hit by a torpedo at 6.17, but as it only gave her a slight list she continued to keep her place in column. The British fleet endeavored to close by changing course more to the eastward, then to south and west, but the Germans made similar changes, so that the distance between the fleets remained practically the same. Both British and German accounts agree that after the British main fleet arrived, the opposing fleets were only able to see vessels of the other side at intervals on account of the mist and smoke. After 7.45 they lost sight of each other until 8.30, when Beatty sighted the Germans and was heavily engaged with them for a short time. During the night Jellicoe maneuvered to keep between the German fleet and its base while Beatty pushed to the eastward to get between it and the coast of Jutland. Several destroyer attacks were made by both sides before dark and during the night. The results were that the British lost the armored cruiser *Black Prince*, the flotilla leaders *Tipperary* and *Turbulent*, and the destroyers *Ardent*, *Fortune*, and *Sparrowhawk*. The destroyer *Shark* was sunk in an earlier attack about 6.16. The Germans lost the old type battleship *Pommern*, the cruiser *Frauenlob* and several destroyers. At daylight the British cruised to the northward seeking the German fleet and the Germans said they cruised to the southward during the night seeking the British fleet. At 1.15 P. M. the British squadrons left for their respective bases.

The British losses in the battle were: battle cruisers *Queen Mary* (27,000 tons), *Indefatigable* (18,750 tons), *Invincible* (17,250 tons); armored cruisers *Defence* (14,600 tons), *Warrior* (13,660 tons)—she sank on her way to England but her crew was saved—*Black Prince* (13,660 tons); flotilla leaders *Turbulent* (1850 tons), *Tipperary* (1850); destroyers *Nestor* (1200), *Nomad* (1200), *Ardent* (935), *Fortune* (935), *Shark* (935), *Sparrowhawk* (935). The Germans report their losses as: battle cruiser *Lutzow* (28,000 tons), pre-dreadnought battleship *Pommern* (12,997), fast light cruisers *Elbing* (5440), *Wiesbaden* (5000), *Rostock* (4822), the old cruiser *Frauenlob* (2672), and five destroyers.

A few days after the battle of Jutland, the British armored cruiser *Hampshire* struck (June 6th) a mine off the coast of Scotland and sank. Lord Kitchener, several other prominent Englishmen, and nearly all the crew were lost. Later in the month, an unimportant fight took place between the German and Russian scout-

ing forces in the Baltic. On July 22nd, German destroyers appeared off the mouth of the Thames, but did little damage before being driven off. During July the *Deutschland*, a large merchant submarine, made a trip to the United States, carrying dyestuffs and other valuable cargo. She left on August 1st, for her return voyage, carrying an equally valuable lading. A sister boat, the *Bremen*, was supposed to have been captured or sunk by the British.

On August 19th the German fleet came out again. The light cruisers, destroyers, and submarines met the British scouts, and the British fleet was called out at once. After an engagement between the scouting forces in which the British fast cruisers *Falmouth* and *Nottingham* were sunk by submarines, the German forces retired, but not until the dreadnought battleship *Westfalen* (18,600 tons), was torpedoed and seriously injured. The German admiralty admitted the injury to the *Westfalen* but said no German vessels were lost.

In October the German submarine *U-53*, which had crossed the Atlantic and called at Newport, R. I., on its return to Germany sank several merchant vessels off Nantucket, two of which were owned by neutrals. A short time afterwards the *Deutschland* arrived in the United States on a second trip.

The naval operations and incidents of the year in the Mediterranean were of no special effect on the course of the war. The forces of the Entente Allies continued to apply pressure upon Greece to join their side and were otherwise busily engaged in searching for the enemy's submarines and submarine bases. In February the *Amiral Charner* (French armored cruiser) was sunk off the coast of Asia Minor by a submarine; and the British battleship *Russell*, of pre-dreadnought type, was sunk by a mine in April. Sometime in August the Italian battleship *Leonardo da Vinci*, dreadnought type, and Italy's newest battleship, caught fire and blew up while at anchor in the harbor of Taranto; while the Russian battleship *Imperatrix Maria*, dreadnought type, was destroyed under similar conditions on the 20th of October.

The operations in the Adriatic, Aegean, eastern Mediterranean, and Black Sea seemed to have no purpose except to annoy the enemy and interfere with submarine warfare. No systematic attempt to obtain control of the Adriatic or Black Sea was made. The Austrian vessels operated freely in the former; and the *Goeben* and *Breslau* did likewise in the Black Sea, though they carefully avoided the regions where the Russian navy was likely to be found in force. The anti-submarine warfare was partially successful and the activity of the German and Austrian submarines was much reduced during the year. See AERONAUTICS; BATTLESHIPS AND OTHER WAR VESSELS; SUBMARINES; UNITED STATES AND THE WAR; WAR OF THE NATIONS; and section on *Navy* under each country.

WARSHIP LOSSES

Of the various navies from August 1, 1914, to December 31, 1916

Abbreviations Used in Foregoing Table:

A.B.	Destroyed by bomb from aircraft.
A.C.	Armored cruiser.
Aux. O.	Auxiliary cruiser (armed merchant ship).
B.	Battleships of pre-dreadnought type.
B.O.	Battle cruiser.
B.D.	Battleship, dreadnought type.
B.O.	Battleship of very old type.
C.	(Cruiser (speed less than 23 knots)).
Cap.	Captured.
Col.	Sunk by collision (accidental).
D.	Destroyer.
Ex. A.	Sunk by explosion (accidental).
Ex. O.	Blown up to avoid capture.
F.	Foundered.
F.C.	Fast cruiser (speed over 23 knots).
G.	Destroyed by gun fire.
G.B.	Gunboat.
Hosp.	Hospital ship.
I.	Interned in a neutral port.
M.	Sunk by a mine.
Min.	Mine layer.
Miss.	Missing.
Mon.	Monitor.
Patr.	Patrol boat.
Ram.	Rammed and sunk.
R. Mon.	River monitor.
S.	Submarine.
S.G.	Sunk by gun fire from a submarine.
SK.	Sunk; details unknown.
Sk. O.	Sunk to avoid capture.
S.T.	Sunk by a torpedo from a submarine.
Sup.	Supply vessel.
Surv.	Surveying vessel.
T.	Sunk by a torpedo not fired by a submarine.
T.B.	Torpedo boat.
Tran.	Transport.
Tr. Sh.	Training ship.
W.	Wrecked.
W.C.	Run ashore to avoid capture.

**NAVY.** See BATTLESHIPS AND OTHER WAR VESSELS; NAVAL PROGRESS; SUBMARINES.

**NEBRASKA.** POPULATION. The estimated population of the State on Dec. 31, 1916, was 1,277,750. The population in 1910 was 1,192,214.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by

the United States Department of Agriculture, in 1915-16 were as follows:

	Year	Acreage	Prod. Bu.	Value
Corn	1916	7,400,000	192,400,000	\$150,072,000
	1915	7,100,000	213,000,000	100,110,000
Wheat	1916	3,540,000	68,550,000	109,880,000
	1915	3,876,000	71,018,000	59,855,000
Oats	1916	2,250,000	79,875,000	37,541,000
	1915	2,200,000	70,400,000	21,824,000
Potatoes	1916	105,000	7,665,000	11,498,000
	1915	110,000	11,550,000	4,851,000
Hay	1916	1,850,000	4,070,000	28,397,000
	1915	1,750,000	4,850,000	26,390,000
Rye	1916	192,000	3,072,000	3,564,000
	1915	200,000	3,500,000	2,555,000
Barley	1916	110,000	3,080,000	2,310,000
	1915	105,000	3,255,000	1,867,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in so far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments	2,500	2,492
Average number of wage earners	24,336	25,144
Capital invested	\$99,901,000	\$121,008,000
Wages	13,948,000	16,898,000
The value of materials used	151,081,000	174,114,000
The value of products	199,019,000	221,616,000

**TRANSPORTATION.** The total single track line operated in the State on June 30, 1916, was 8313 miles. The roads having the longest railway mileage were the Chicago, Burlington, and Quincy, 3601; the Chicago and Northwestern, 1306; and the Northern Pacific, 488.

**EDUCATION.** The children of school age in the State on July, 1915, the latest date for which statistics are available, numbered 387,522. The total enrollment in the public schools was 290,875, with an average daily attendance of 212,049. The total number of teachers was 12,327, of whom 10,749 were females and 1586 males. There was paid to teachers the sum of \$6,217,797. The average monthly salary paid to male teachers was \$72.87, and to female teachers \$57.56. The total expenditure for educational purposes was \$10,121,558.

**FINANCE.** The latest reports of the financial condition of the State are for 1914. The total receipts for the year ending in November were \$6,754,142. The expenditures were \$6,346,043. The balance in the treasury at the end of the year was \$746,108.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State are under the control of the board of commissioners of State institutions. They include the Nebraska Institute for Feeble-Minded Youth at Beatrice, the Girls' Industrial School at Geneva, the Nebraska Soldiers' and Sailors' Home at Burkett, the Asylum for the Insane of Nebraska at Engleside, the State Industrial School at Kearney, the Hospital for Tuberculosis at Kearney, Hospital for the Insane at Lincoln, Orthopedic Hospital at Lincoln, the State Penitentiary at Lincoln, the Nebraska Industrial Home at Milford, the Soldiers' and Sailors' Home at Milford, the Institute for the Blind at Nebraska City, Hospital for the Insane at Norfolk, School for the Deaf at Omaha, Home for Dependent Children at Lincoln.

**POLITICS AND GOVERNMENT.** The presidential year found politics in Nebraska in a plastic condition, so far as party lines are concerned, due to several causes. The division of 1912 in the Republican party had not yet been bridged over, while the Democrats were not united entirely as to policy; although the Democratic party was in power in the State, it was badly split by factional disputes, one of which raged between the followers and the opponents of William Jennings Bryan, and another was occasioned by the impending campaign for State-wide prohibition. An effort to secure the union of the Republicans by placing the name of Charles Evans Hughes on the primary ballot was discouraged by Mr. Hughes, who declined to allow his name formally to go before the voters. However, when the election was held, 16,000 Republicans wrote the name of Hughes on their ballots, and thus showed the strong trend of sentiment in his favor. Albert B. Cummins of Iowa received the Republican preferential vote for president, having a small plurality over Henry Ford; other names voted for were Henry D. Estabrook of New York and Robert G. Ross of Nebraska. The Democrats presented but one name, that of Woodrow Wilson, at the primary as a candidate for president, but the anti-Bryan faction won, denying Mr. Bryan a seat in the St. Louis convention as delegate from his home State. At the Chicago convention the Republican delegates gave their support to Hughes after discharging their obligation to Cummins and Ford. The State tickets nominated were such as to make the final result of the election appear somewhat anomalous. On an initiated petition an amendment to the constitution, providing for State-wide prohibition was submitted to the voters. Both Republican and Democratic parties omitted any reference to prohibition in their platforms, tacitly consenting to the amendment going before the electorate as a nonpartisan issue. However, the Republican candidate for governor had made his primary campaign as an advocate of prohibition, while the successful Democratic candidate was avowedly opposed to prohibition. Charles W. Bryan, brother of William J., had sought nomination from the Democrats as a "dry" candidate for governor, and was decisively defeated. John L. Kennedy of Omaha, who was the Republican candidate for United States Senator against Gilbert M. Hitchcock (Dem.), seeking reelection, was also in favor of prohibition, although he made it no part of his campaign. National issues were brought into the hustings through the tariff, the war, and the railroad strike legislation. Both Mr. Wilson and Mr. Hughes visited the State, Mr. Wilson making a speech at Omaha, and Mr. Hughes spending two full days in the State, winding up his visit at Omaha. Mr. Bryan also made several addresses in the State, but dealt mainly with the issue of prohibition and national issues. The uncertainty of the outcome was increased to some degree by the fact that a large percentage of Nebraska's population is foreign-born or of foreign parentage. The outcome of the voting gave the State to President Wilson by a plurality of 41,056 over Hughes and a majority of 30,943 over all. The total vote of the State was 302,685, the largest in its history by more than 25,000. For president: Wilson, 158,827; Hughes, 117,771; Ben-

son, 7141; Hanly, 2952. The prohibition amendment carried by the following vote: for, 146,574; against, 117,132. Neville, Democrat, for governor ("wet"), was elected over Sutton, Republican ("dry"), by 143,461 to 136,810. Gilbert M. Hitchcock, Democrat, was re-elected to the United States Senate over Kennedy, Republican, by 143,082 to 131,359. Three Republicans and three Democrats were re-elected to the House of Representatives. On the vote for Congressmen, the Republicans have a plurality in the State of 5279. The entire Democratic State ticket was elected, and the Democrats control in both branches of the Legislature.

**STATE OFFICERS.** Governor, Keith Neville; Lieutenant-Governor, Edgar Howard; Secretary of State, C. W. Pool; Treasurer, G. E. Hall; Auditor, W. H. Smith; Attorney-General, W. E. Reed; Superintendent of Education, W. H. Clemmons—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, A. M. Morrissey; Justices, Charles B. Letton, Francis G. Hamer, William B. Rose, Samuel H. Sedgwick, James R. Dean, Albert J. Cornish; Clerk, H. C. Lindsay.

**STATE LEGISLATURE:**

	Senate	House	Joint Ballot
Democrats .....	22	62	84
Republicans .....	11	38	49
Democratic majority..	11	24	35

**NEBRASKA, UNIVERSITY OF.** A State educational institution at Lincoln, Neb., founded in 1869. In all departments in the fall of 1916 there were 4737 students. The teaching staff numbered 328. W. W. Burr was appointed professor of agronomy. The permanent endowment fund, as accumulated to November 30th, amounted to \$815,277. For the preceding year the total available resources for all purposes amounted to \$1,736,208. The library contained 130,632 volumes. Chancellor, Samuel Avery. See also **HORTICULTURE**.

**NECROLOGY.** The following list contains the names of notable persons who died in 1916. An asterisk before a name indicates that it will be found in its proper alphabetical place in the **YEAR BOOK** as the title of a separate article.

- \* Abbe, Cleveland.
- \* Achurch, Janet.
- Adams, Annie. See Kiskadden, Annie Adams.
- \* Aleichem, Scholem.
- Alexander, Béla. Hungarian radiologist, director of the radiologic institute of the Budapest Royal Hungarian University; noted for Röntgen ray researches and as author of a book on this subject that was translated into several languages. Died at Budapest, February 10; born, 1857.
- \* Angell, James Burrill.
- Arbuthnot, Sir Robert Keith, fourth Bart. British rear admiral, commanding first cruiser squadron in 1916. Killed in action off Jutland, May 31.
- \* Archbold, John Dustin.
- \* Arnoldson, Klas Pontus.
- Ashby, Thomas Almond. American gynecologist, professor in the University of Maryland and in the Woman's Medical College, Baltimore; gynecologist to the Maryland General Hospital; former president of the Medical and Chirurgical Faculty of Maryland; member of the State House of Delegates in 1910; and author of books on the Civil War. Died in Baltimore, June 26; born, 1848.
- \* Ashley, Clarence D.
- Aubé, Jean Paul. French sculptor, many of whose works, principally classical and portrait subjects, are in public places in Paris; professor in the Académie

- des Beaux-Arts. Died at Capbreton (Landes), August 23; born, 1837.
- Aubrey, William Hickman Smith. British journalist, author, and lecturer. Died at Croydon, February 10; born, 1858.
- Augusta Caroline. Dowager Grand Duchess of Mecklenburg-Strelitz, a Princess of Great Britain, Ireland, and Hanover and the last surviving grandchild of George III of England. Her death at Neustrelitz was announced December 5. She was born in 1821.
- Babcock, Charles Henry. American Protestant Episcopal clergyman, a former president of the Church Congress. Died in New York City, January 6; born, 1845.
- \* Babcock, Stephen.
- \* Baccelli, Guido.
- Backlund (Johan), Oskar. Swedish astronomer of Russian residence, director of the Pulkova Observatory. Died August 29; born, 1846. See ASTRONOMY.
- \* Bacon, Edwin M.
- Baker, Lady Florence. Widow of the British explorer, Sir Samuel White Baker, whom she accompanied on important African expeditions. Died at Newton Abbot, England, March 11; born, 1842.
- Ball, Sir Charles Bent, Bart. Irish surgeon, honorary surgeon to the King in Ireland and Regius professor of surgery at Dublin University. Died in Dublin, March 17; born, 1851.
- \* Ballet, Gilbert.
- \* Barker, Albert Smith.
- Barrows, Charles Clifford. American surgeon, professor of gynecology at Cornell University Medical College. died in New York, January 2; born, 1857.
- Bartlett, Samuel. Canadian ice navigator, noted for his experience and skill; commander at different times of the *Diana*, the *Windward*, the *Erk*, and the *Jeanie*; in 1903-04 master of the *Neptune*, in A. P. Lowe's expedition to Hudson Bay and the Arctic archipelago. Died at Brigus, Newfoundland, September 9.
- Barton, Enos M. American electrical engineer, president and later chairman of the board of directors of the Western Electric Company, died at Biloxi, Miss., May 3; born, 1842.
- Bassett, Austin Bradley. American Congregational minister, and later a professor in and secretary of Hartford Theological Seminary. Died in Hartford, Conn., October 5; born, 1859.
- Battisti, Cesare. Italian author and editor, leader of Italian irredentism in the Trentino; editor of *Tridentum* of Trent. Wounded, captured at Vallarsa, and hanged by the Austrians July 16. Born 1875.
- Baxter, Walter. British navigator, commodore of the Anchor Line fleet. Died in Glasgow, June 17; born, 1849.
- \* Bean, Tarleton Hoffman.
- \* Beck, Edward Anthony.
- Beecham, Sir Joseph, Bart. British pill manufacturer, famous for his sensational advertising, who became the third-richest man in England, with a fortune of \$140,000,000. Died in Hampstead, October 28; born, 1848.
- \* Begas, Karl.
- Benini, Ferruccio. One of the greatest of Italian actors, especially renowned as an interpreter of Goldoni and Giacinto Gallina. Died in 1916; born, 1854.
- Beothy, Paul. Hungarian statesman, president of the Hungarian Diet; former Minister of Commerce. Died in Budapest, October 6.
- Berlepech, Goswina von. Austrian writer, known especially for novels set in Switzerland, where they have been very popular. Among the titles are: *Mutter, Mann und Weib*, *Heimat*, and *Jakobe*. Died in Vienna, April 9; born, 1845.
- Birkbeck, William John. British scholar and traveler, student of Russian ecclesiastical and political affairs, known for important translations of Russian and other Slavonic religious works. Died June 9; born, 1859.
- Bishop, Emily Montague. American health culturist, writer, and suffrage pioneer, widow of Coleman Bishop (once editor of *Judge*). Died in New York City, November 22; born, 1858.
- \* Blake, Lucien Ira.
- Blanchard, James Armstrong. American jurist, associate justice of the Supreme Court of New York from 1899 to 1915. Died in New York City, July 9; born, 1845.
- Blessing, Henrik Greve. Norwegian scientist and explorer, physician and botanist of the Nansen Polar Expedition in 1893-96. His death in Christiania was announced May 22.
- Blind, Rudolf. British religious painter. Died in London, February 3; born, 1850 (in Brussels).
- \* Bias, Daniel.
- \* Blow, Susan Elizabeth.
- Blue, Leonard A. American educator, dean of the New York State College of Teachers. Died in Albany, N. Y., August 18; born, 1869.
- Blumenschein, William Leonard. American organist and composer, from 1891 to 1896 chorus-master of the Cincinnati May Festival. Died at Dayton, Ohio, March 27; born, 1849.
- \* Bogue, Virgil Gay.
- \* Boissevain, Inez Millholland.
- \* Boldt, George C.
- \* Bolton, Sarah Knowles.
- Bolzani, Ugo. Italian historian and medievalist. Died February 27; born, 1847.
- \* Booth, Charles.
- Boucaut, Sir James Penn. Australian statesman, who had been premier of South Australia, deputy governor, and Supreme Court judge. Died in Adelaide, February 1; born, 1831.
- Boucicault, Mrs. Dion. See Robertson, Agnes.
- Bowen, Marcellus. American missionary, representative of the American Bible Society in Constantinople since 1888. Died in Geneva, Switzerland, October 3; born, 1846.
- Bowker, William Henry. American agricultural expert, a pioneer in the fertilizer industry (president Bowker Fertilizer Co.), and trustee of the Massachusetts Agricultural College. Died in Boston, January 5; born, 1851.
- Bowring, Sir William. British shipowner, and in 1893-94 Lord Mayor of Liverpool; created a baronet in 1907. Died in Liverpool, October 21; born, 1837.
- Boyd, Sir John Alexander. Canadian jurist, since 1881 chancellor of the Province of Ontario. Died in Toronto, November 23; born, 1837.
- \* Braun, Lily.
- \* Braun, Ludwig.
- Brewer, Leigh Richmond. American Protestant Episcopal clergyman since 1880 missionary bishop of Montana. Died at Helena, Mont., August 28; born, 1839.
- Brickner, Samuel Max. American gynecologist and editor of the *Medical Pickwick*. Died at Saranac Lake, N. Y., May 5; born, 1867.
- \* Brooke, Stopford Augustus.
- Brooks, Joseph. American theatrical manager. Died in New York City, November 27; born, 1849.
- \* Brown, Francis.
- Brown, Robert Burns. American soldier and journalist, past commander in chief of the Grand Army of the Republic and editor of the *Zanesville Courier*. Died in Zanesville, Ohio, July 30; born, 1844.
- Brown, Thomas Wistar. American Quaker business man, financier, and philanthropist, generous benefactor of Haverford College (of whose board of managers he was president for 25 years) and of the Pennsylvania Hospital, to which he gave \$600,000.
- \* Brownlow, Sir Charles.
- Bruns, Ludwig. German physician, professor of neurology in the University of Hanover and chief surgeon of the Hospital for Children's Diseases in that city; author of important contributions in his field. Died November 12; born, 1858.
- \* Brunton, Sir (Thomas) Lauder.
- Bugatti, Rembrandt. Italian animal sculptor. Died in Paris, January 9; born, 1885.
- Bunce, William Gedney. American landscape painter, member of the National Academy of Design and of the National Institute of Arts and Letters. Died in Hartford, Conn., November 5; born, 1840. He studied under Achenbach in Munich and P. J. Clays in Antwerp. Medals were awarded him at Paris, Charleston, and St. Louis. His "Morning View in Venice," "Early Morning—Venice," and "Studio of F. D. Millet," are in the Metropolitan Museum, New York; "Sunset, San Giorgio, Venice," in the National Gallery, Washington, and "On the Lagoon," in the Rhode Island School of Design.
- \* Burleigh, Edwin Chick.
- \* Burnett, Henry Lawrence.
- \* Burnham, Edward Levy-Lawson, first Baron.
- \* Burrill, Thomas Jonathan.
- \* Burroughs, Edith Woodman.
- Bustanoby, Andre. American restaurateur. Died in New York City, February 10; born, 1872 (in Pau, France.)
- \* Cabrera & Ibars, Juan Bautistas.
- Caird, Sir James Key, first Bart. British manufacturer and philanthropist, who had given away a total of about \$1,250,000, and was chief backer of the Shackleton Antarctic expedition. Died at Belmont Castle, Perthshire, March 9; born, 1837.
- \* Calhoun, William James.
- Canning, Albert Stratford George. British author of books on history, philosophy, religion, and literary criticism. Died at Rostrevor, County Down, Ireland, April 22; born, 1832.
- \* Cannon, James Graham.
- Cardenas, Adam. Nicaraguan statesman, President of Nicaragua from 1882 to 1886, leader of the Conservative party, and president of the Congress in 1911. Died at San Juan del Sur, July 13.
- Carmen Sylva. See Elizabeth, Dowager Queen of Rumania.
- \* Carpenter, Louis Henry.
- Carr, Frank Osmond. English composer of many light

operas, some very successful. Died at Uxbridge, England, August 29; born, 1858.

Carr, J. W. Comyns. British editor, art critic, and dramatist. Died in London. December 18; born, 1849.

Carter, Thomas Coke. American clergyman, Bishop of the United Brethren Church, resident in Chattanooga, Tenn. Died in Cincinnati, Ohio, February 27; born, 1851.

\* Cassius, Joaquin D.

\* Casement, Sir Roger David.

Casgrain, Thomas Chase. Canadian lawyer and cabinet member, attorney-general of Canada in 1892-96 and since 1915. Died at Ottawa, December 29; born, 1852.

\* Catlin, Isaac Swartwood.

\* Chamberlain, Samuel Selwyn.

Chapman, Victor Emmanuel. American aviator and soldier, son of John Jay Chapman; student in the Ecole des Beaux-Arts, Paris, at the outbreak of the European war. Sergeant in the Franco-American flying corps, the first American aviator killed in the war. After making a brilliant record, he was shot dead over the German lines before Verdun, June 23.

\* Charmes, Francis.

Charrington, Janet Achurch. See Achurch.

\* Chase, William Merritt.

Chauveau, Charles Alexandre. Canadian lawyer and banker, former solicitor-general of the Province of Quebec and professor of criminal law in Laval University for 15 years. Died in New York City, March 7; born, 1847.

\* Cheney, Charles Edward.

Chivacci, Vincenz. Austrian editor. Died in Vienna in 1916; born, 1847. See GERMAN LITERATURE, *Necrology*.

Clam, du Paty de. French army officer, a colonel, who figured prominently in the Dreyfus case. Died of wounds, September 4.

\* Clanricarde, Hubert, second Marquis.

\* Clarke, James P.

\* Clementi-Smith, Sir Cecil.

Clough, William Pitt. American railroad man, chairman of the board of directors of the Northern Pacific Railway. Died in New York City, August 17; born, 1844.

Cohan, Josephine. See Niblo.

Colby, Mrs. Clara Bewick. American pioneer suffragist, founder and for 25 years editor of *The Woman's Tribune*, a reform paper. She was among the first women to take a degree at the University of Wisconsin, where she afterward taught Latin. Died in Palo Alto, Cal., September 7.

Colin, Paul. French landscape painter; also designer of several important tapestries executed by the Gobelins. Died in Paris June 18; born, 1838.

Collin, L. J. Raphael. French figure and portrait painter, known best for decorations in the Sorbonne and for the ceilings of the Odéon and the Opéra Comique, Paris. Died in Brionne (Eure), Oct. 21; born, 1850.

\* Colton, George Radcliffe.

Concas y Palau, Victor María. Spanish vice admiral and statesman; commander of the Spanish cruiser *Infanta María Theresa* in the Battle of Santiago de Cuba; Minister of Marine in 1905; arbitrator of land claims against the United States made by residents of Panama, and was to have completed this service in 1917. Death announced from Madrid September 26; born, 1845.

\* Connolly, James.

Cook, Albert John. American naturalist, State commissioner of horticulture of California from 1911. Died in Owasso, Mich., September 29; born, 1842.

NEGRI SEMBILAN, THE (NINE STATES). A Federation of states composing a state of the Federated Malay States (q. v.).

NEIGHBORHOOD PLAYHOUSE. See DRAMA.

**NEISSER, ALBERT LUDWIG SIEGMUND.** A German dermatologist, died at Breslau July 30, 1916. He was born at Schweidnitz, German Silesia, in 1855, studied at Erlangen and Breslau. At the latter university he took his medical degree in 1877 and he was identified with it during all but two years of his career as a teacher. Since 1907 he had been professor of dermatology and syphilis and director of the dermatological clinic. In the study of leprosy he traveled widely. Besides investigating this disease and syphilis, Professor Neisser conducted researches on gonorrhoea, and discovered the gonococcus. His writings on the subjects in which he specialized include more than 100 titles.

**NEO-SALVARSAN.** See TRICHINOSIS.

**NEPOL.** An independent Himalayan kingdom covering about 54,000 square miles, and having a population estimated at 3,000,000. Katmandu, with some 50,000 inhabitants, is the capital.

**NEPTUNE.** See ASTRONOMY.

**NETHERLANDS, THE (or HOLLAND).** A constitutional monarchy of western Europe, lying between Germany and the North Sea; a neutral in the War of the Nations. Capital, The Hague.

**AREA AND POPULATION.** The total area, including the rivers of Zeeland and South Holland, the Zuider Zee, the Dollart, and the Wadden (the shallows extending along the shores of Friesland and Groningen as far as the Dollart), based on a low-tide planimetric calculation, is 40,828.71 square kilometers (15,764 square miles). The land area by provinces, the population according to the census of Dec. 31, 1909, together with the population as calculated Dec. 31, 1914, and the density per square kilometer in 1914, are given in the table below.

	Sq. km.	1909	1914	S.
North Brabant . . .	4,973.84	623,079	670,020	131
Gelderland . . . .	5,024.40	639,602	188,775	71
South Holland. 2,981.00	1,890,744	872,625	112	
North Holland. 2,762.01	1,107,698	345,649	146	
Zeeland . . . . .	1,831.75	232,515	681,824	134
Utrecht . . . . .	1,363.21	288,514	1,202,652	430
Friesland . . . . .	3,220.25	359,552	1,537,568	491
Overijssel . . . . .	3,354.50	382,880	882,682	173
Groningen . . . . .	2,283.52	328,045	410,826	121
Drenthe . . . . .	2,662.09	173,318	307,547	222
Limburg . . . . .	2,194.68	332,007	239,676	88
<b>Total . . . . .</b>	<b>32,600.25*</b>	<b>5,858,175</b>	<b>6,339,854</b>	<b>185</b>

\* 12,587 square miles.

Like the Flemish, the Dutch belong to the Low-German branch of the Teutonic race. The majority of the population are Protestants. Dutch, 5,788,193; German, 37,534. There were 42,539 marriages in 1914, 176,831 births, 77,739 deaths, 6899 stillbirths; 2174 emigrants. Communal population (Dec. 31, 1914) of Amsterdam, 609,084; Rotterdam, 472,520; The Hague, 312,480; Utrecht, 127,086; Groningen, 82,809; Haarlem, 71,883; Arnhem, 66,129; Leiden, 59,560; Nimeguen, 60,515; Tilburg, 55,736; Dordrecht, 49,952; Maastricht, 39,572; Apeldoorn, 40,542; Leeuwarden, 39,130; Bois-le-Duc, 36,034; Enschede, 37,909; Delft, 35,402; Schiedam, 35,166; Zwolle, 34,187; Hilversum, 33,637; Emmen, 33,166; Deventer, 29,926; Breda, 27,769.

**EDUCATION.** Primary instruction is compul-

sory and free in the public schools, which are provided by local taxation where private institutions are lacking. In preference, however, to maintaining public schools, the government encourages and subsidizes private instruction. The number of public elementary schools reported in 1913-14 was 3334, with 19,843 teachers and 564,314 pupils; private, 2268, with 13,403 teachers and 394,793 pupils. Public infant schools, 177, with 34,208 pupils; private, 1127, with 109,625. The average attendance is 95 per cent. Secondary instruction is not free. The special schools are excellent and well attended. There are universities at Amsterdam, Groningen, Leiden, and Utrecht, as well as a small private university.

**PRODUCTION.** The land is flat and low, and traversed by numerous rivers and canals. Grains, flax, hemp, root crops, and tobacco are grown. Poultry, eggs, and dairy products are exported. Of the productive area, 872,171 hectares are classed as arable, 1,213,073 pasture, 78,097 gardens and orchards, 260,923 forest. The following table shows area and production of main crops in 1912 and 1916 (1916 figures subject to slight revision), with production per hectare in 1912:

	Hectares		Quintals		Qa. ha.
	1912	1916	1912	1916	
Wheat . . . . .	57,854	54,850	1,501,007	1,098,000	25.9
Rye . . . . .	228,044	201,746	4,026,718	3,147,560	17.7
Barley . . . . .	26,861	24,246	723,518	543,775	27.3
Oats . . . . .	137,863	138,820	2,645,088	3,228,000	19.2
Flax * . . . . .	14,862	14,640	98,197	92,311	...
Beets † . . . . .	64,824	68,643	21,760,860	19,188,000	335.7

\* Fibre production. † Sugar beets.

Quantities of bulbs, shrubs, trees, vegetables, and fruits are raised for export, the total shipments of bulbs, shrubs, and trees being valued in 1914 at 21,350,521 guilders (15,230,483 gl. in 1910), vegetables, 18,285,870 (64,800,000), fruits, 6,762,254 (3,188,000).

Planted to potatoes in 1916 were 167,173 hectares (171,753 in 1915, 123,385 in 1914), yielding 20,054,000 quintals (23,883,603 in 1915, 25,257,750 in 1914).

The coal mines belong mostly to the state; total output (1914), 1,928,540 metric tons, valued at 14,471,000 gl. There were reported (1914) 384 distilleries, 10 sugar refineries, 27 beet sugar refineries, 31 salt works, 413 breweries, 60 vinegar factories. The output of the herring fisheries (North Sea) was valued at 12,595,000 gl.

**COMMERCE.** The export of cereals and flour has been prohibited since Aug. 3, 1914, of cotton since August 7th, and of linseed since Sept. 24, 1914. The decree of Jan. 26, 1915, suspending provisionally the prohibition on the export of raw cotton, has been annulled by a royal decree of June 2, 1915.

By order of the minister of agriculture dated Nov. 25, 1915, permits may be granted for the export of restricted amounts of linseed of Dutch origin.

The government reserves the right to grant exceptions in certain cases from these prohibitions of export, and a law of March 11, 1916, enacts that a charge is to be made to cover the cost of issue of any licenses for this purpose. Export licenses are only issued for definitely described quantities and for a period not ex-

ceeding one month. The maximum charge is 50 cents per quintal, or one-eighth per cent ad valorem.

The total imports for consumption and exports of domestic produce are seen below for three years (precious metals included), in guilders (par value of the guilder, 40.196 cents):

	1912	1913	1914
Imports	3,613,000,000	3,917,800,000	2,889,000,000
Exports	3,113,100,000	3,082,900,000	2,505,000,000

A comparison of some of the principal articles of trade, imports with exports, is of interest as an indication of the chief sources of the nation's wealth and the corresponding necessities not supplied by home production (values in thousands of guilders, 1914):

Imports	1000 gl.	Exports	1000 gl.
Cereals, etc.	397,908	Iron and steel	247,032
Iron, etc.	375,744	Flour, etc.	281,567
Textiles	186,125	Textiles	174,551
Fuel	115,706	Copper	99,717
Rice, etc.	105,719	Paper	85,690
Copper	99,259	Rice flour	72,588
Wood	73,892	Margarine	71,749
Gold, etc.	62,840	Sugar	59,736
Fertilizers	60,444	Coffee	48,752
Seeds	48,683	Butter	38,287
Coffee	54,978	Skins	37,135
Dyes	19,352	Cheese	23,746

The table below gives countries of origin and destination in the 1914 and 1913 trade, values in millions of guilders; it must be borne in mind, however, that while oversea trade is generally credited to the country of first origin, trade by the frontiers is credited to the immediate transmitter, so that much of the trade with France is classed as Belgian, etc.:

	Imports		Exports	
	1914	1913	1914	1913
Germany	875.7	1,058.6	1,043.5	1,363.2
D. E. Ind.	395.0	528.5	143.2	162.8
U. K.	326.3	340.8	602.2	633.8
Belgium	245.9	352.1	219.5	339.6
U. S.	300.7	442.7	164.0	131.3
Russia	188.2	366.1	21.7	30.6
Spain	70.0	99.4	....	....
Br. E. Ind.	89.4	99.9	....	....
Hamburg	47.1	68.1	33.7	59.4
France	27.4	33.2	23.1	31.4

There entered at the ports in the 1914 trade, 12,484 vessels, of 13,540,000 tons (Dutch, 4320, of 4,575,000); cleared, 12,669, of 13,565,000 (4480, of 5,653,000).

Holland is practically free trade and the only duties levied are of a fiscal character. Merchant marine, Jan. 1, 1915, 407 steamers (719,669 tons) and 402 sailing (47,150).

COMMUNICATIONS. On Jan. 1, 1915, there were in operation 3339 kilometers of railway. The land is a network of canals and rivers. State telegraph lines, 1913, 8098 kilometers; wires, 40,354 kilometers. Post offices, 1537.

FINANCE. The guilder (par value 40.196 cents) is the unit of value. In the table below are given revenue and expenditure for comparative years, in guilders:

	1912	1913	1914
Rev. ordinary	211,443,000	223,507,000	224,927,000
Rev. extraord.	1,958,000	3,915,000	20,639,000
Total	213,401,000	227,422,000	245,566,000

Expenditure:	1912	1913	1914
Defense	49,188,000	52,909,000	143,030,000
Debt	37,593,000	38,021,000	40,175,000
Pub. works	15,159,000	17,162,000	24,492,000
General	122,725,000	130,685,000	184,697,000
Total	224,665,000	238,727,000	342,394,000

The budget estimates for 1915 placed revenue and expenditure at 294,977,657 and 216,207,000 guilders respectively; 1916 budget, 272,653,314 and 224,703,460 guilders. The debt stood Jan. 1, 1916, at 1,405,991,000 guilders.

NAVY. See NAVAL PROGRESS.

GOVERNMENT. By the constitution of 1848 (amended 1887) the executive power rests in a sovereign, and the legislative in the sovereign and a parliamentary body composed of two chambers. The upper chamber has 50 members, elected for nine years by the provincial states and possesses powers of approval or rejection, not of amendment. The lower, composed of 100 popularly elected members, possesses solely the right of legislative initiative. A consultative state council of 14 members is appointed by the sovereign.

Wilhelmina, the reigning queen, was born Aug. 31, 1880; she succeeded her father Nov. 23, 1890, her mother acting as regent till Aug. 31, 1898. She married, Feb. 7, 1901, Duke Henry of Mecklenburg-Schwerin. The heiress-apparent is Princess Juliana, born April 30, 1909.

HISTORY. The strain on Dutch neutrality was very severe. Great indignation was caused by the torpedoing of Dutch vessels by the Germans, especially the *Palembang* on March 18th and the *Tuban* on March 16th. On the other hand, the British Orders in Council, with their restriction of Dutch trade, also aroused indignant protests. In April the situation seemed so serious that military measures were taken, and it was thought that Holland might be involved in the war. It was necessary to keep up border patrols and enforce other war precautions, and these duties involved such heavy expenditures that a war loan was required. In spite of these new expenses the government tried to carry through the old-age pension measure. A ministerial crisis ensued in January. On February 3rd the finance minister, Treub, resigned and was succeeded by Van Gijn February 11th. The country suffered, along with other European nations, a shortage of flour. This had developed early in the war and the baking of white bread was at that time prohibited. Down to April, 1916, conditions seemed normal but soon after that flour became scarce again and in June the government was again obliged to prohibit the baking of white bread. On November 15th, Parliament voted unanimously a constitutional amendment providing for universal suffrage and at the same time removing the sex disability of women, though the actual grant of the vote to women depended on the passage of an electoral measure at a future date. The Lower House on November 17th voted to make women eligible to membership in the States-General.

The high tides following severe storms on the coast caused the collapse of the dikes at several points on the Zuider Zee January 14th-20th, and the loss of many lives and of property valued at \$100,000,000. Damage from flood continued to occur near Amsterdam and at

other points in the north. Dams burst at Punnereud and Monnokendam. The towns of Volendam and Edam suffered severely and a large part of the surrounding country was inundated.

**NEUTRALITY.** See CONTRABAND OF WAR; UNITED STATES AND THE WAR; WAR OF THE NATIONS.

**NEVADA. POPULATION.** The population of the State on Dec. 31, 1916, was 108,736. The population in 1910 was 81,975.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn .....1916	1,000	34,000	\$42,000
.....1915	1,000	35,000	38,000
Wheat .....1916	55,000	1,592,000	2,229,000
.....1915	56,000	1,660,000	1,557,000
Oats .....1916	14,000	602,000	452,000
.....1915	13,000	585,000	322,000
Potatoes ....1916	14,000	2,660,000	3,458,000
.....1915	13,000	2,286,000	1,565,000
Hay .....1916	225,000	540,000	5,184,000
.....1915	235,000	675,000	5,062,000
Barley .....1916	12,000	492,000	467,000
.....1915	12,000	576,000	408,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments.....	177	180
Average number of wage earners.....	2,257	3,655
Capital invested.....	\$9,808,000	\$13,591,000
Wages.....	1,982,000	3,578,000
The value of materials used....	8,366,000	9,317,000
The value of products.....	11,887,000	16,083,000

**MINERAL PRODUCTION.** The value of the gold, silver, copper, lead, and zinc from the mines of the State in 1916 was approximately \$52,475,000, according to the estimates of the United States Geological Survey. This represents an increase of nearly \$18,000,000, or about 52 per cent over 1915. There were large increases and record productions in copper, lead, and zinc, a slight decrease in silver, and a decrease in gold. The gold output was valued at approximately \$9,000,000, a decrease of 22 per cent from the output of 1915. The mined production of silver was about 13,680,000 ounces, a decrease from 14,459,840 ounces in 1915. The value of the output on account of the higher prices of silver increased from \$7,331,139 to about \$9,000,000, or 23 per cent. The production of copper increased from 68,636,370 pounds in 1915 to over 103,000,000 pounds in 1916, an increase of nearly 35,000,000 pounds, with a great increase in value from \$3,022,680 to \$4,759,000, or 57 per cent.

The silver mines of the State in 1915 showed a decrease of about 975 ounces, following a similar decrease in 1914.

**TRANSPORTATION.** The total railway mileage of the State in 1916 was 2831. Of this, 2269 miles were main track. Railroads having the longest mileage are the Southern Pacific, 746; Western Pacific, 427; the Los Angeles and Salt Lake, 212.

**EDUCATION.** The total school population of the State in 1916 was 14,087, with an enrollment of 12,941, and an average daily attendance of 9456. There were 94 men and 563 women teachers. Men teachers received an average monthly salary of \$133.41, and women, \$87.55.

**FINANCE.** The total receipts for the fiscal year 1916 amounted to \$1,814,412, and the disbursements to \$1,488,392. There was a balance on Jan. 1, 1916, of \$302,420, and on Dec. 31, 1916, of \$628,440.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the Orphans' Home, State Prison, and Nevada Hospital for Mental Diseases. The Crittenton Home at Reno receives aid from the State, but is not under State supervision.

**POLITICS AND GOVERNMENT.** Nevada, prior to the election of November, was classed as a somewhat doubtful State in regard to national issues, and its vote was cast for President Wilson. He received 17,776 votes, and Huges 12,127. The vote for the Socialist and Prohibitionist candidates was very small. Senator Key Pittman, Democrat, was reelected, defeating Republican and Socialist candidates. The main issue in the Senatorial fight was the Pittman land grant bill, which was introduced into Congress by Senator Pittman. Strong opposition developed against this measure, and while Senator Pittman was reelected, he was a minority candidate. Congressman Roberts, Republican, returned to Congress for the third time. On the plea of removing the State University from the zone of politics, the three Republican candidates, Benjamin F. Curler, George Abel, and Mrs. Edna C. Baker, were elected. This fight was waged in connection with the opposition to the Pittman land bill, it having been charged that university officials had lobbied at Washington for the measure. J. A. Sanders was elected justice of the Supreme Court. Mr. Sanders was a Democrat, but political affiliations of supreme court candidates do not appear on the ballot. For the first time in the history of the State women cast votes for president.

**STATE OFFICERS.** Governor, Emmet D. Boyle; Lieutenant-Governor and Adjutant-General, Maurice J. Sullivan; Secretary of State, George Brodigan; Treasurer, Edward Malley; Comptroller, George A. Cole; Superintendent of Public Instruction, John Edward Bray; Attorney-General, George B. Thatcher—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, P. A. McCarron; Justices, Benjamin W. Coleman and J. A. Sanders; Clerk, H. R. Mighels.

**STATE LEGISLATURE:**

	Senate	House	Joint Ballot
Republicans .....	10	24	34
Democrats .....	8	25	33
Independents .....	3	5	6
Socialists .....	1	1	2

**NEVADA, UNIVERSITY OF.** A State co-educational institution at Reno, Nev., founded in 1873. The total enrollment for the fall of 1916 was 401, 224 men and 117 women. Including the experiment station and extension workers, the faculty numbered 59. For the past biennial, the appropriations for the use of the university have been \$266,837 from the State and \$194,360 from the Federal government. The

university also administers money for the board of stock commissioners, the Tonopah School of Mines, and for irrigation investigations. The library contains 35,000 volumes. President, Archer Wilmot Hendrick.

**NEVILLE, KEITH.** Elected Democratic Governor of Nebraska, Nov. 7, 1916.

**NEW, HARRY STEWART.** Elected Republican United States Senator from Indiana, Nov. 7, 1916.

**NEWARK, N. J.** See CELEBRATIONS; CITY PLANNING; MUSIC, *Festivals.*

**NEWBOLT, SIR HENRY.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction, English.*

**NEW BRUNSWICK.** One of the Maritime provinces of the Dominion of Canada, situated east of the State of Maine and south of Quebec. The capital is Fredericton. The area is 27,985 square miles, of which 74 water. Between 1901 and 1911 the population increased 6.27 per cent, or from 331,120 to 351,889. In 1911 the city of St. John had 42,511 inhabitants; Moncton (now the eastern terminus of the National Transcontinental Railway), 11,345; Fredericton, 7208. Of the population 10 years of age and over in 1911, males numbered 136,196 (51.27 per cent) and females 129,453 (48.73); of these, 103,275 males and 16,491 females were reported as employed in gainful occupations. Of the males employed, 43.4 per cent were in agriculture, 15.7 per cent in manufacturing, and 11.4 in the building trades; of the females, 40.3 per cent were in domestic and personal service, 23.8 per cent in manufacturing, and 18.1 per cent professional.

The provincial government is administered by a lieutenant-governor, appointed for five years by the Governor-General of the Dominion; he acts through an executive council, or responsible ministry of six members. The legislative power is vested in the House of Assembly, a single chamber of 48 members elected by direct vote for five years. In the 12th Parliament, which convened in 1911, New Brunswick was represented by 10 senators and 13 members of the House of Commons; the representation in the Commons on the basis of the 1911 census, is 11. The lieutenant-governor in 1916 was Josiah Wood, appointed March 6, 1912, in succession to L. J. Tweedie.

**NEW CALEDONIA.** A French Melanesian colony which, with the Loyalty Islands and other dependencies, covers 18,653 square kilometers, with 50,680 inhabitants. The dependencies are Wallis Archipelago, 96 square kilometers and 4500 inhabitants; Fortuna and Alofi, 159 square kilometers and 1500 inhabitants; Chesterfield Islands, 0.8 square kilometers. The capital of the colony is Nouméa, with 6968 inhabitants. Imports (1914), £664,160; exports, £618,760. The 1913 budget balanced at 4,342,621 francs. Railways, 16 kilometers; telegraph lines, 1042 kilometers (wire, 1650).

**NEW CHURCH.** See CHURCH OF THE NEW JERUSALEM.

**NEWFOUNDLAND.** A British colony; an island on the northeast side of the Gulf of St. Lawrence. Area, 42,734 square miles. Population (1911), 242,619, including 3949 in Labrador, of which the coastal portion comprehended between Hudson Strait and Blanc Sablon, including the Hamilton basin, is attached administratively to Newfoundland. Population 1914,

251,723 (Labrador, 4016). Capital, St. John's, with 32,292 inhabitants. The fisheries occupy the majority of the population, cod being the chief export—1,132,720 quintals, valued at \$6,544,604 in 1910-11, besides 300,000 quintals retained for local consumption; exports 1913-14, 1,247,314 quintals, valued at \$8,071,889. Agriculture, mining, and lumbering are carried on. At Grand Falls and Bishop's Falls are large pulp and paper mills. The government railway from St. John's to Harbor Grace is 84 miles long, and the branch to Exploits is 200 miles long; and the line, recently completed, from Exploits to Port-Aux-Basques, 285 miles. Total length, with branches to Brigus, Tilton, Carbonar, and Burnt Bay, about 638 miles. Length of lines under construction to Trinity, Bonavista, Heart's Content, Trepassay, Fortune Bay, and Bonne Bay, about 300 miles. Trade and finance statistics are given below:

	1910-11	1911-12	1913-14
Imports .....	\$18,888,910	\$14,783,490	\$15,193,785
Exports .....	11,975,747	18,874,809	15,134,548
Revenue .....	8,527,126	8,786,456	8,618,829
Expenditure ...	8,854,747	8,524,653	8,920,178

\* Tonnage entered and cleared.

The export of wheat and oats is prohibited to all destinations, that of corn, linseed, barley, and oatmeal to all destinations other than the United Kingdom and British possessions and protectorates. The export of raw cotton, corn, meal, rice, and rye, with their products, to all foreign countries in Europe and on the Mediterranean and Black seas, other than France, Russia (except through Baltic ports), Italy, Spain, and Portugal is also prohibited. The proclamations now in force are dated Sept. 6, Oct. 5, Nov. 9 and 23, and Dec. 14, 1915, Jan. 4, Feb. 12, March 14, 27, and April 4, 1916.

Customs revenue, 1913-14, \$3,083,313. Public debt, June 30, 1915, \$31,426,765.

**NEW GUINEA.** The largest of the East Indian islands and after Australia and Greenland the largest island in the world. The area is not known exactly, but may be placed at about 310,000 square miles. The number of inhabitants is still more conjectural, but is estimated at slightly less than 1,000,000. See DUTCH EAST INDIES; KAISER-WILHELMSLAND; GERMAN NEW GUINEA; PAPUA.

**NEW HAMPSHIRE.** POPULATION. The population of the State on Dec. 31, 1916, was 443,467. The population in 1910 was 430,572.

AGRICULTURE. The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn .....	1916 19,000	874,000	\$1,005,000
	1915 22,000	990,000	752,000
Oats .....	1916 12,000	444,000	306,000
	1915 12,000	456,000	246,000
Potatoes ...	1916 15,000	1,800,000	2,988,000
	1915 16,000	1,520,000	1,444,000
Hay .....	1916 529,000	a 767,000	11,122,000

	1915 1,000	30,000	24,000

a Tons. b Pounds.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments..	1,961	1,786
Average number of wage earners .....	78,658	78,998
Capital invested .....	\$189,990,000	\$156,749,000
Wages .....	86,200,000	40,642,000
The value of materials used	98,157,000	114,998,000
The value of products.....	164,511,000	182,844,000

**TRANSPORTATION.** The total railway mileage of the State on June 30, 1915, was 12,052. There was no construction during 1916.

**EDUCATION.** The total school population of the State in 1916 was 78,899. The total enrollment was 77,996, and the average daily attendance 54,485. The last figure is for the elementary schools only. There were 2493 teachers in the elementary schools, and 554 in the secondary schools. The average yearly salary of men teachers in the secondary schools was \$1379, and of women teachers \$630. The average monthly salary of men teachers in the elementary schools was \$73.12, and of women teachers \$46.49.

**FINANCE.** There was a balance in the treasury on Sept. 1, 1915, of \$616,121. The total receipts for the year ending Aug. 31, 1916, amounted to \$3,557,514, and the disbursements to \$3,502,242, leaving a balance on Sept. 1, 1916, of \$671,393. The total indebtedness of the State on Sept. 1, 1916, was \$1,068,954.

**CHARITIES AND CORRECTIONS.** The State board of charities and corrections has charge of the charitable and correctional institutions of the State. These include the State Hospital for the Insane, New Hampshire State Prison, State Sanatorium, State Industrial School, School for Feeble-Minded, New Hampshire Soldiers' Home, and county jails in each of the counties. The county prisons and jails are also under the supervision of the board. It has general control in addition of a number of private institutions.

**POLITICS AND GOVERNMENT.** The political events of 1916 in New Hampshire related exclusively to election matters, as the legislative sessions are biennial. The primary election law had been extended to the choice of delegates to the national political conventions, and such vote was taken at the time of the annual March meeting for the election of local officials in the towns, with a special election in the cities. For such delegate elections, there were no contests; the Democrats chosen were pronouncedly in favor of the renomination of President Wilson and the Republicans were divided, a minority being avowedly in favor of the candidacy of Senator Weeks of Massachusetts, who has a summer home in the northern part of the State. The Progressives sent a full delegation to the national convention of that party.

The State-wide primary for the nomination of candidates for the November election was held the first Tuesday in September. This was preceded by spirited contests, particularly for the gubernatorial nominations. Henry W. Keyes of Haverhill on the Republican side won over Rosecrans W. Pillsbury of Londonderry. Both can-

didates conducted a speaking campaign, visiting practically every town in the State. It was the fourth campaign that Pillsbury had waged for the nomination, each time in face of the opposition of the so-called party "organization." The vote was: Keyes, 12,724; Pillsbury, 9683, about 50 per cent of the party vote at the November election being cast.

On the Democratic side, the same candidates contested as in the 1914 campaign, Albert W. Noone of Peterborough and John C. Hutchins of Stratford, the former winning that contest by a plurality of only two votes. In the 1916 contest, the result was reversed, Hutchins receiving a vote of 4855 and Noone, 2979.

There was also a lively contest for the Republican nomination for Congress in the first district where Cyrus A. Sulloway sought a renomination for the eleventh consecutive time. The other contestants were the Rev. Thomas Chalmers, pastor of the First Congregational Church of Manchester, and O. L. Haselton of Manchester, president of the State Senate. Sulloway won by a pronounced plurality. The Progressive party, whose vote at earlier elections had been amply large to win for it a legal standing as a party, made no rival nominations, but for the most part designated the same candidates as the Republicans. This action gave the Republican campaign managers increased confidence for their general ticket, but they nevertheless conducted the liveliest campaign that the State had witnessed in many years. There were no clear-cut local issues between the parties, the campaign being waged on national issues, principally the course of the administration as to Mexican and foreign belligerent affairs.

The Republicans won the State election, by a reduced margin, as compared with previous years, but its candidates for presidential electors were defeated by about 50 votes. The vote for electors was: Wilson and Marshall, 43,871; Hughes and Fairbanks, 43,725; for all others, 1621. The vote for Governor was: Keyes, Republican and Progressive, 45,899; Hutchins, Democrat, 38,853; for all others, 1490. The vote for Keyes under the Progressive party emblem was 48. As the law requires 3 per cent of the total, the result removes the Progressive party from the list of regular political parties in New Hampshire.

Of the five members of the Governor's council, four Republicans and one Democrat were chosen, a gain of one for the Democratic party.

Of the 24 Senators, the Republicans elected 16 and the Democrats 8, a Democratic gain of 4. The House of Representatives will have a Republican plurality of about 70, a loss of about 50.

At the November election, the question of the expediency of calling a convention to revise the constitution was submitted. The vote was favorable, resulting: yes, 21,589; no, 14,520. The Legislature of 1917 will make provision for such convention and it will probably be assembled next June. The last convention of the sort was held in June, 1912, and previous to that, in December, 1902. The pressing questions are a revision of the provisions as to the taxation of money at interest, and growing timber, and for a reduction in the size of the House of Representatives, there now being a membership of 420.

The United States government in January

purchased under the Weeks Forestry Act, a tract of 5500 acres in the White Mountains. This tract will be added to the lands already acquired and set apart as a public reservation. It is situated on the slope of the Presidential Range and includes the summit of Mount Webster, Mount Jackson, and Mount Clinton. This purchase gives to the government control of practically all the peaks of the Presidential Range, or brings its holdings in New Hampshire up to more than 270,000 acres.

**STATE OFFICERS.** Governor, Henry W. Keyes, Rep.; Secretary of State, Edwin C. Bean, Rep.; Treasurer, John W. Plummer, Rep.; Adjutant-General, Charles W. Howard, Rep.; Attorney-General, J. P. Tuttle, Rep.; Superintendent of Public Instruction, Henry C. Morrison, Dem.; Commissioner of Insurance, R. J. Merrill, Prog.

**JUDICIARY.** Supreme Court: Chief Justice, Frank N. Parsons; Associate Justices, Reuben E. Walker, John E. Young, Robert J. Peaslee, William A. Plummer; Clerk, Arthur C. Chase.

**STATE LEGISLATURE:**

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Republicans .....	18	240	258
Democrats .....	8	160	168
Republican majority..	8	80	88

**NEW HAMPSHIRE COLLEGE.** A co-educational State institution at Durham, N. H., founded in 1866. In 1916 there were 653 students and 63 faculty members. The college has productive funds amounting to \$1,000,000 and in 1916 drew an income from all sources of \$250,000. The library contains 32,000 volumes. President, Edward Thomson Fairchild.

**NEW HEBRIDES.** A group of Melanesian islands jointly administered by France and Great Britain through the French and British high commissioners for the Pacific. There are resident commissioners. Estimated area, 5100 square miles; estimated population, 70,000. Vila, in the island of Efate, is the seat of government. A large proportion of the natives are cannibals.

**NEW JERSEY. POPULATION.** The population of the State on Dec. 31, 1916, was 2,981,105. The population of the State in 1910 was 2,537,167.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	<i>Acreage</i>	<i>Prod. Bu.</i>	<i>Value</i>
Corn .....	1916 370,000	10,800,000	\$10,800,000
	1915 285,000	10,830,000	8,122,000
Wheat .....	1916 90,000	1,800,000	2,952,000
	1915 78,000	1,560,000	1,654,000
Oats .....	1916 69,000	2,070,000	1,268,000
	1915 70,000	2,275,000	1,092,000
Potatoes .....	1916 85,000	10,370,000	16,074,000

*a* Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the

following comparative condition of manufactures in 1909 and 1914:

	<i>1909</i>	<i>1914</i>
Number of establishments	8,817	9,742
Average number of wage earners .....	826,223	873,605
Capital invested .....	\$977,172,000	\$1,352,382,000
Wages .....	169,710,000	211,136,000
The value of materials used	720,034,000	883,465,000
The value of products...	1,145,529,000	1,406,683,000

**MINERAL PRODUCTION.** The production of iron ore in the State in 1915 was 415,234 gross tons, compared with 350,135 tons in 1914. The total shipments from the mines of the State in 1915 were 391,215 tons, valued at \$1,140,040, compared with 346,830 tons, valued at \$1,076,208, in 1914.

**TRANSPORTATION.** The total track mileage of the railroads in the State on Jan. 1, 1916, was 5889. The railways having the longest mileage are the Pennsylvania, 1129; the Central Railroad of New Jersey, 1129; the Delaware, Lackawanna, and Western, 696; the Lehigh Valley, 494; the Erie, 478.

**EDUCATION.** The total enrollment in the public schools of the State in 1916 was 540,287. The average daily attendance was 421,884. There were 16,741 teachers, who received an average yearly salary of \$372.

**FINANCE.** The gross receipts for the fiscal year ending Oct. 31, 1916, amounted to \$12,917,658, and the disbursements to \$11,297,103. There was a balance on Oct. 31, 1915, of \$2,457,687, and on Oct. 31, 1916, of \$4,078,242.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions under the control of the State department of charities and corrections include the State Hospital at Morris Plains, New Jersey State Village for Epileptics at Skillman, State Home for Feeble-Minded at Vineland, Sanatorium for Tuberculosis at Glen Gardner, New Jersey State Prison at Trenton, New Jersey Reformatory at Rahway, New Jersey State Reformatory at Clinton, New Jersey State Home for Boys at Jamesburg, New Jersey State Home for Girls at Trenton, New Jersey Home for Disabled Soldiers at Kearny, New Jersey Home for Disabled Soldiers and Sailors and their Wives or Widows at Vineland. During the year the State took over what was known as the Burlington Colony for the Feeble-Minded, and is now known as the State Colony for Feeble-Minded Males. There were in this colony, at the end of the year, 43 boys.

**LEGISLATION.** The State Legislature met in 1916 and enacted many important measures. A record of these is given below:

Procedures in courts were amended. A budget system was established requiring the Governor to make his recommended appropriations on the basis of estimates submitted by the departments; all appropriations are required to appear in the general appropriations bill. A central purchasing agency controlled by a commission consisting of the Governor, Treasurer, and Comptroller was created. This agency is to purchase all supplies for State departments and office, except for construction work. The municipal construction, ownership, and operation or lease of docks, warehouses, or shipping facilities are authorized. The State is divided into two water districts and a water supply commission created to act for each. A commission

was created to study the operation of civil service laws in the State and its municipalities. The election laws were amended. Registration in person or by an affidavit is required in municipalities of more than 10,000. A commission of laws was created, to revise and codify statutes relating to municipalities. Appropriations were made for vocational education. A State department of agriculture was created. The question of the creation of a highway commission was referred to the voters of the State. The office of commissioner of motor vehicles was created. A workmen's compensation aid bureau was created in the labor department with the duty of observing the operation of a compensation law and assisting employees in recovering their full compensation. The laws relating to insurance were amended, as were also the laws relating to banks and banking. Provision was made for the regulation of "jitneys."

A new law went into effect on July 1st, providing that articles of food which had been held in cold storage for 30 days or more should not be advertised or represented as fresh, but should be marked cold storage. The law required also that cold storage should be licensed by the State Department of Health. They must also make monthly reports to this department, instead of quarterly reports as heretofore.

**POLITICS AND GOVERNMENT.** The New Jersey political campaign of 1916 had unusual interest from the fact that the State was the home of President Wilson. The months preceding election he lived at Long Branch. In neither party was there a contest over the election of delegates to the respective national conventions, but in the primary campaign for the nomination of candidates there was a keen struggle for both the governorship and the United States senatorial nomination in the Republican ranks, and for the senatorship only on the Democratic side.

The Republican candidates for Governor were Walter E. Edge of Atlantic County, Austen Colgate of Essex, and George L. Record of Hudson. The last named, who ran on a platform of local option, home rule, public ownership of public utilities, and exemption of buildings and improvements from taxation, was one of the original leaders of the Progressive party in the State. Both Edge and Colgate were members of the State Senate and both were pledged to give the State an efficient and business-like administration. For United States Senator the Republican candidates were Franklin Murphy of Essex, a former Governor and a member of the Republican national committee, and Joseph S. Frelinghuysen of Somerset, president of the State board of agriculture and of the State board of education. Edge won the governorship nomination by 3611 and Frelinghuysen the senatorial nomination by 7877.

H. Otto Wittpenn of Hudson, naval officer of the port of New York and a former mayor of Jersey City, was the unopposed Democratic candidate for Governor. United States Senator James E. Martine was a candidate for renomination and was opposed by Atty.-Gen. John W. Wescott, who at Baltimore in 1912 and at St. Louis in 1916 had made speeches on behalf of the Jersey delegation, placing Woodrow Wilson in nomination. It was generally

believed that administration sympathy was with Mr. Wescott. Martine won by 21,334.

Both parties made energetic campaigns previous to the November election. The Republicans laid great stress on their view of the need of a higher tariff. The vote was: Hughes, 268,982; Wilson, 211,018; plurality for Hughes, 57,964. The Socialist ticket received 10,405 votes; Prohibition, 3182; Socialist-Labor, 855. For United States Senator Frelinghuysen polled 244,715; Martine, 170,019. For Governor, Edge received 247,343; Wittpenn, 177,696.

The Republicans elected 10 of the 12 representatives in Congress, a gain of 2, and carried both branches of the Legislature, having a majority of 37 on joint ballot. The Senate stands 15 Republicans to 6 Democrats, and the Assembly 44 Republicans to 16 Democrats.

**STATE OFFICERS.** Governor, Walter E. Edge, Rep.; Secretary of State, Thomas F. Martin, Dem.; Treasurer, William T. Read, Rep.; Comptroller, Edward I. Edwards, Dem.; Attorney-General, John W. Wescott, Dem.; Commissioner of Education, Calvin N. Kendall, Dem.; Commissioner of Insurance, G. M. La Monte, Dem.

**JUDICIARY.** Court of Errors and Appeals: Chancellor, Edwin Robert Walker; Chief Justice of the Supreme Court, William S. Gummere; Justices, Charles G. Garrison, Francis J. Swayze, Thomas W. Trenchard, Charles W. Parker, James J. Bergen, James F. Minturn, Samuel Kalisch, Charles C. Black; Lay Judges, John Josiah White, Henry S. Terhune, Ernest J. Heppenheimer, Robert Williams, Frank M. Taylor, and Walter P. Gardner.

**STATE LEGISLATURE:**

	Senate	House	Joint Ballot
Republicans .....	15	44	59
Democrats .....	6	16	22
Republican majority..	9	28	37

**NEW MEXICO. POPULATION.** The population of the State on Dec. 31, 1916, was 416,966. The population in 1910 was 327,301.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

		Acreage	Prod. Bu.	Value
Corn .....	1916	125,000	2,625,000	\$2,966,000
	1915	105,000	2,780,000	1,993,000
Wheat .....	1916	113,000	2,104,000	3,156,000
	1915	89,000	1,976,000	1,779,000
Oats .....	1916	64,000	1,856,000	1,244,000
	1915	60,000	2,180,000	1,080,000
Barley .....	1916	11,000	308,000	308,000
	1915	8,000	264,000	185,000
Potatoes .....	1916	8,000	816,000	1,428,000
	1915	8,000	800,000	760,000
Hay .....	1916	185,000	370,000	5,180,000
	1915	201,000	442,000	3,890,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments.....	818	868
Average number of wage earners	4,148	3,776

	1909	1914
Capital invested .....	\$7,748,000	\$8,984,000
Wages .....	2,591,000	2,695,000
The value of materials used ....	3,261,000	4,480,000
The value of products .....	7,898,000	9,820,000

**MINERAL PRODUCTION.** The output of the State in 1915, according to the United States Geological Survey, was valued at more than \$19,000,000. The gold production was valued at \$1,461,005. There were 2,500,531 ounces of silver, 76,788,366 pounds of copper, 4,542,361 pounds of lead, and 25,405,064 pounds of zinc. These figures indicate an increase of \$289,308 in gold, 228,068 ounces of silver, 17,480,441 pounds of copper, 2,778,725 pounds of lead, and 7,000,672 pounds of zinc. The value of the metals except silver was higher than 1914. The total was \$19,279,368, compared with \$11,049,932 in 1914.

The output of metal in the State in 1916 is estimated by the United States Geological Survey as follows: gold, \$1,350,000, silver 1,800,000 ounces, lead 7,100,000 pounds, copper 91,400,000 pounds, zinc 36,500,000 pounds. These figures showed decreases of \$111,105 in gold, 700,531 ounces of silver, but increases of \$167,596 in the value of the silver, 14,611,634 pounds in quantity and \$11,514,236 in the value of copper, 2,557,639 pounds in quantity and \$269,309 in value of lead, and 11,094,936 pounds in quantity and \$2,349,896 in the value of zinc. The total value of the five metals increased \$14,190,000, or nearly 74 per cent, in 1916.

The coal production of the State in 1916 was estimated at 4,570,000 tons, an increase of about 24 per cent over the production of 1914. The increase was due to the larger quantity of coal made into coke, and to the demand for railroad fuel. Except in November the supply of cars was ample, but there was a shortage of available labor. The market for coal from New Mexico was extended on the Pacific Coast, and to interior points that normally depend on water-borne coal.

**TRANSPORTATION.** The total railway mileage of the State is about 3000. There has been practically no construction in the last three years. The lines having the longest mileage are the Atchison, Topeka, and Santa Fe, 1194; El Paso and Southwestern, 625; the Denver and Rio Grande, 217.

**EDUCATION.** The total school population of the State in 1916 was 114,206. The total enrollment in the public schools was 75,736, with an average daily attendance of 68,147. The male teachers numbered 731, and females 1571, or 2302. The average salary of male teachers was \$535.79, and of women \$538.94. In March, 1916, New Mexico was embraced within the territory of the North Central Association of Colleges and Secondary Schools.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Insane Asylum at Las Vegas, the State Penitentiary at Santa Fe, the Reform School at Springer, the Miners' Hospital at Raton, and the Deaf and Dumb Asylum at Santa Fe.

**POLITICS AND GOVERNMENT.** The State Legislature did not meet in 1916. There was an election for United States Senator and for Governor. The election was extraordinarily close, in both local and national elections. E. C. De Baca, Democrat, was elected Governor by a vote

of 32,732 against 31,524 cast for H. C. Bursum, his Republican opponent. For United States Senator A. A. Jones, Democrat, received 33,982 votes, as against 30,609 cast for Frank A. Hubbell, Republican candidate. At the national election Wilson received 33,527 votes, and Hughes 31,152. The Socialists cast 2033 votes for United States Senator, and 1999 for Benson, their candidate for President.

On May 13th work was completed on the Elephant Butte dam. By damming the Rio Grande River there was formed what is said to be the greatest storage reservoir in the world. The dam has taken five years to build. It is the work of the United States Reclamation Service. The reservoir feeds an irrigation system covering 185,000 acres of land in New Mexico, Texas, and Mexico. The dam is thrown across canyons of the Rio Grande River 1210 miles north of El Paso. It stores the entire flow and flood of the river, and holds when full 115,000,000,000 cubic feet of water. The dam is 318 feet high and 1674 feet long. Across its top runs a road 16 feet wide. The base of the dam is 235 feet thick. The territory irrigated by the reservoir lies in four valleys, for each of which there are a diversion dam and main canals. Twenty-five thousand acres of the land are on the Mexican side of the river. Before beginning construction work the government laid out a town equipped with all modern conveniences and in this there were at times as many as 4000 people, whose government was entirely under the jurisdiction of the engineers. The railroad was constructed through 13 miles of rough country to connect the camp with the main line railroad.

**STATE OFFICERS.** Governor, E. C. De Baca, Dem.; Lieutenant-Governor, W. E. Lindsey, Rep.; Secretary of State, Antonio Lucero, Dem.; Treasurer, H. L. Hall, Dem.; Auditor, W. G. Sargent, Rep.; Adjutant-General, Harry T. Herring, Dem.; Attorney-General, Harry L. Patton, Dem.; Superintendent of Public Instruction, John H. Wagner, Rep.; Commissioner of Insurance, Jacobo Chavez, Rep.

**JUDICIARY.** Supreme Court: Chief Justice, R. H. Hanna; Associate Justices, Clarence J. Roberts and Frank W. Parker; Clerk, José D. Sena.

**STATE LEGISLATURE:**

**NEW ORLEANS OPERA HOUSE.** See MUSIC, *General News*.

**NEW SOUTH WALES.** A southeastern state of the Commonwealth of Australia. It is bounded on the north by Queensland, on the east by the Pacific Ocean, on the south by Victoria, and on the west by South Australia. The estimated area is 309,460 square miles, which is slightly more than one-tenth the area of the Commonwealth. The population, according to the 1911 census, was 1,646,734 (857,698 males, 789,036 females), exclusive of full-blooded aboriginals. The increase per cent in the decade 1901-11 was 21.67, in 1891-1901 20.54, in 1881-91 49.90. Estimated population June 30, 1915, 1,868,656. The capital is Sydney, the largest

Australian city; its population at the 1911 census was 112,921; including suburbs, 629,503; estimate at end of 1914, 752,500.

The official report of the New South Wales Railways and Tramways Commission showed a deficit for the year ending June 30, 1916, of \$668,934. The deficit of the railways was \$1,088,874, but was in part offset by a profit of \$419,940, made from the tramways. In 1914-15 the profit for the combined services amounted to \$325,102. During the fiscal year 1915-16, 292,021,774 passengers were carried on the tram lines, as compared with 289,282,845 in 1914-15; the steam railways carried 92,850,838 passengers, against 88,774,451. No passengers were fatally injured by accident to trains.

The executive authority rests with a governor, who is appointed by the Crown and is assisted by a responsible ministry. The Parliament consists of the legislative council and the legislative assembly. Members of the council are not less than 21 in number (56 in 1914), and are appointed by the Crown for life; members of the assembly number 90, elected by universal suffrage. The maximum duration of a parliament is three years. The governor in 1916 (from March 14, 1913) was Sir Gerald Strickland, Count della Catena, G. C. M. G.; premier and treasurer, William Arthur Holman. See AUSTRALIA.

**NEW YORK. POPULATION.** The population of the State on Dec. 31, 1916, was 10,366,778. The population in 1910 was 9,113,614.

	1916	1915	1914
Rye	151,000	150,000	151,000
Barley	81,000	81,000	85,000
	2,718,000	2,805,000	2,720,000
	\$3,479,000	2,609,000	1,906,000
		1,887,000	2,040,000

a Tons. b Pounds.

**MINERAL PRODUCTION.** New York ranks fifth among the States in the production of iron ore, being surpassed only by Minnesota, Michigan, Alabama, and Wisconsin. The total production in 1915 was 998,845 gross tons, compared with 785,377 tons in 1914. There were shipped from the mines in the State in 1915, 931,745 tons, valued at \$2,797,270, compared with 640,252 tons, valued at \$1,992,892, in 1914.

There were produced in the State in 1915 887,778 barrels of petroleum, compared with a production of 938,974 barrels in 1914.

**MANUFACTURES.** The census for manufactures for 1914 showed a consistent increase as compared with that of 1909. The capital invested in 1914 was \$3,334,278,000, an increase of \$554,781,000, or 20 per cent over 1909. The value of the production was \$3,814,661,000, compared with \$3,369,490,000 in 1909, an increase of 13.2 per cent. The number of wage earners employed during the year was 1,057,857, compared with 1,003,981 in 1909, or an increase of 5.4 per cent. The most important facts in relation to the census for 1914 as compared with that of 1909 are shown in the following table:

	Census—		Per cent of increase 1909-1914
	1914	1909	
Number of establishments	48,203	44,935	7.3
Persons engaged in manufactures	1,289,098	1,208,241	7.1
Proprietors and firm members	48,636	47,569	2.2
Salaried employees	182,605	151,691	20.4
Wage earners (average number)	1,057,857	1,003,981	5.4
Wage earners, by months—			
January	1,055,575	945,856	...
February	1,078,854	971,286	...
March	1,094,773	991,683	...
April	1,084,215	989,498	...
May	1,067,080	983,987	...
June	1,058,471	980,503	...
July	1,038,953	977,203	...
August	1,037,475	998,896	...
September	1,067,384	1,041,338	...
October	1,072,512	1,068,162	...
November	1,034,649	1,059,852	...
December	1,014,893	1,045,110	...
Primary horsepower	2,856,655	1,997,662	18.0
Capital	\$3,334,278,000	\$2,779,497,000	20.0
Services	873,771,000	743,263,000	17.6
Salaries	242,729,000	186,032,000	30.5
Wages	631,042,000	557,231,000	13.2
Materials	2,108,607,000	1,856,904,000	13.6
Value of products	3,814,661,000	3,369,490,000	13.2
Value added by manufacture (value of products less cost of materials)	1,706,054,000	1,512,586,000	12.8

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	1916	1915	1914
Corn	540,000	605,000	450,000
Wheat	450,000	475,000	1,206,000
Oats	1,206,000	1,340,000	820,000
Potatoes	820,000	855,000	4,500,000
Hay	4,500,000	4,225,000	3,700
Tobacco	3,700	4,400	
	16,200,000	24,200,000	9,030,000
	18,876,000	15,170,000	11,994,000
	19,441,000	24,422,000	85,392,000
	18,048,000	86,751,000	86,224,000
	592,000	5,280,000	502,000

**TRANSPORTATION.** The total steam railroad mileage of the State on June 30, 1916, was 98,458. The roads having the longest mileage were the New York Central, 2820; the Erie, 950; Delaware and Hudson, 724; and the Lehigh Valley, 659.

**EDUCATION.** The total school population of the State in 1914-15 was 2,306,142. The total enrollment in the public schools was 1,579,040. There was an average daily attendance of 1,288,047. During the year 46,140 female teachers and 5775 male teachers were employed. The average yearly salary of all teachers in the State was \$975.13. The Legislature of 1916 enacted a physical training law, which is con-

sidered one of the most important movements in education ever undertaken. This law provides that all children in attendance in public or private schools between the ages of 8 and 16 shall receive a certain amount of physical training each year. The law makes it a duty of the board of regents to prescribe a syllabus, outlining the work to be given in physical training, and also gives that body the discretion to determine the maximum amount which shall be given each year. The president of the university has charge of the enforcement of this law. Under the provision of this statute President Finley, of the board of regents, promulgated in the latter part of the year a comprehensive scheme of health education, to be put into operation in every school of the State. The department also engaged in a movement for the improvement of rural schools. A campaign was inaugurated for the consolidation of such schools, so as to bring sufficient pupils into one school to properly grade the school, and to provide advanced instruction for such pupils. This movement also brings sufficient property to the support of one school to enable that school to provide trained teachers and to adopt courses of study, which are adapted to the needs and conditions of rural life. Several hundred consolidations were made during the year.

**FINANCE.** The receipts from all sources for the fiscal year ending June 30, 1916, amounted to \$105,040,958, and the disbursements to \$91,352,054. There was a balance at the beginning of the fiscal year of \$28,235,768, and at the end of \$41,924,672. The bonded debt of the State at the end of the year was \$211,404,660.

**CHARITIES AND CORRECTIONS.** For information on charities and corrections in New York see articles on CHARITIES, PENOLOGY, ETC.

**POLITICS AND GOVERNMENT.** Governor Whitman's message to the Legislature, sent on January 5th, contained a number of important recommendations. These included the centring of financial authority, audit, and responsibility with the comptroller, making him practically as important an official as the Governor. He also advocated the inauguration of a budget system, which would compel the Legislature to give detailed reasons for every appropriation in advance. He advised the substitution of serial bonds for long term improvement bonds, and a correction in the sinking funds methods. He urged the abolition of all special funds and the substitution for them of three days' sinking funds contributions, the proceeds from the State manufactured products, and a general fund for all current State expenses. He favored also the abolition of port wardens, and the health officers of New York City, and for transfer of their functions to the Federal government. He urged also the abandonment and discontinuance of several other institutions, and recommended the erection of a new hospital at Middletown, for the segregation of the aged insane.

On March 14th the Assembly passed the Whitney-Brereton resolution providing for the submission of the woman suffrage question again in 1917. The vote was 109 to 30. The Senate passed the measure on April 10th by a vote of 33 to 10. Favorable action by the Legislature of 1917 will insure a referendum question in that year. The political campaign in the State began at the informal convention held by the Republicans the first week in February. Al-

though no presidential candidate was endorsed, the delegates expressed their preference for Elihu Root. Mr. Root, as temporary chairman, delivered a remarkable address, in which he severely criticised the policies of President Wilson. This marked the actual beginning of the presidential campaign, and is given at considerable length in the article UNITED STATES, *Presidential Campaign*. Governor Whitman was a candidate for renomination for Governor on the Republican ticket, and Samuel Seabury, a judge of the Court of Appeals, was the Democratic candidate. While Judge Seabury had the formal support of the Tammany Hall organization of New York City, it was not particularly enthusiastic for him as a candidate.

A rather remarkable situation developed in the Republican candidacy for United States senator. Senator Root was not a candidate for renomination, and the only active candidate up to within a few days of the primary was William M. Calder, a Representative in Congress. A few weeks prior to the nominating primary, Robert Bacon, formerly Secretary of State, and ambassador to France, decided to become a candidate, and had his name placed by petition on the primary ballot. The Democratic candidates for the nomination were William McCombs and Thomas F. Conway, formerly lieutenant-governor of the State. The primaries were held on September 19th. Governor Whitman was nominated over William Bennett, and Mr. Calder defeated Robert Bacon by a comparatively narrow margin of votes. Mr. Seabury was unopposed in the primary vote for Governor, and Mr. McCombs defeated Mr. Conway for the nomination for United States senator. The campaign following the nominations was a very severe one, as New York was considered to be a doubtful State. It was thought to be the pivotal State in the presidential election. Both Mr. Whitman and Mr. Seabury made active personal campaigns throughout the State. Mr. Whitman made the first issue the defense of his administration, while Judge Seabury assailed his administration as extravagant and incompetent. In the election on November 7th Governor Whitman received 834,360 votes, as against 684,763 for Judge Seabury. For United States senator Mr. Calder received 836,298 against 603,601 for Mr. McCombs. For President, Mr. Hughes carried the State with a vote of 863,841, compared with 756,946 for Mr. Wilson. Two propositions were voted upon, one the question of a convention to revise the constitution. This was defeated by a vote of 656,067 to 504,250. The second proposition was for an act making provision for issuing bonds to the amount not to exceed \$10,000,000 for the acquisition of lands for State park purposes and providing for the submission of the plan to the people to be voted upon at the general election. This was approved by a vote of 650,212 to 499,899.

**NEW YORK CITY.** The Thompson legislative committee appointed in 1915 to examine subway construction in its relation to public service corporations and equipment concerns began hearings in New York City on January 3rd. During the hearings many startling facts regarding payment of large sums of money out of appropriations for subways to officials of subway construction companies and others were divulged. During May the attention of the committee was occupied with investigating wire-tapping by the

police, in which Mayor Mitchel, J. P. Morgan and Company, and a number of Catholic charities were involved. (See CHARITIES.) It was brought out that the police, by authority of the mayor, had tapped certain telephone wires in order to secure information to be used in criminal prosecutions. Other cases of wire-tapping made with the object of discovering, if possible, the relations of certain firms to German agents in this country were also revealed. The grand jury found indictments against a number of persons for illegally tapping the telephone wires of the Rev. William B. Farrell, Dr. Daniel C. Potter, and his son, Dean Potter. On June 14th Mayor Mitchel submitted to the district attorney evidence in which he had charged that Monsignor Dunn, chancellor of the diocese of New York, Father William B. Farrell, and Dr. D. C. Potter had entered into a conspiracy against his administration. The committee continued its investigation into subway matters, and other lines until July 1st. Investigations on the charges of wire-tapping were continued by the district attorney and on September 15th all concerned in the wire-tapping cases were exonerated, and all conspiracy, libel, and perjury charges made by Mayor Mitchel's administration against the Catholic officials were dismissed.

A plan for zoning the city made by real estate experts and engineers was reported on March 13th, and hearings were begun on March 27th. The plan was finally adopted. (See CITY PLANNING.) There were a number of serious strikes in the city during the year. (For an account of these, see the article STRIKES.) The epidemic of infantile paralysis throughout the summer resulted in the death of several thousand persons. See POLIOMYELITIS.

Several investigations were carried on throughout the latter part of the year in order to determine if possible the causes of high prices of certain food commodities. Especial attention was paid to the subject of milk, caused by the action of nearly all the larger milk distributing companies in raising the price of milk. See PRICES.

**LEGISLATION.** The Legislature met in 1916 and passed many important measures. A record of these follows:

The laws regulating the practice of law were amended, and the civil code was amended in several particulars. The charitable institutions in Westchester County were reorganized under the management of the commissioners of charities and corrections. The commission on new prisons was also organized for the selection of a new prison site and a farm and industrial prison, to cost \$1,250,000. Civil War veterans employed for 10 years in the State's service who have reached the age of 70 may apply for retirement at half pay not exceeding \$1000. The institute for public service was incorporated to conduct a training school to prepare men for the public service by doing field work in coöperation with public officials. A military training commission was also created to coöperate with the State Board of Regents in devising school courses and physical training, and to give military training for not more than three hours a week during the academic year. Other changes were made in the laws of military and naval affairs. The employment in making motion picture films of children under 16 years of age was forbidden without the consent of a designated

local officer. It was made a misdemeanor for steam or electric railroads to employ in the operation of trains an engineer or fireman who is unable to read or understand the English language, or to see or understand signals. The workmen's compensation law was extended in its operation. Provision was made for the annulment of marriages when one or both parties have not attained the age under which the consent of parent or guardian is required by the laws of the State where the marriage was contracted. Other changes were made in the laws relating to marriage. The agricultural law was amended in important particulars.

**STATE OFFICERS.** Governor, Charles S. Whitman; Lieutenant-Governor, Edward Schoeneck; Secretary of State, Francis M. Hugo; Comptroller, Eugene M. Travis; State Treasurer, James L. Wells; Attorney-General, Egbert E. Woodbury; State Engineer and Surveyor, Frank M. Williams; Superintendent of Insurance, Jesse S. Phillips; Superintendent of Banking, E. L. Richards; Superintendent of Prisons, James M. Carter; Superintendent of Public Works, W. W. Wotherspoon; Commissioner of Education, John S. Finley—all Republicans.

**JUDICIARY.** Court of Appeals: Frank H. Hitchcock, Chief Judge; Associate Judges, William H. Cuddeback, John W. Hogan, Frederick Collin, Cuthbert W. Pound, Emery A. Chase, Benjamin N. Cardozo.

**STATE LEGISLATURE.** The Legislature of 1916 is composed of 36 Republicans and 15 Democrats in the Senate, 99 Republicans, 49 Democrats, and 2 Socialists in the Assembly. In both bodies the Republicans have 125 members, the Democrats 54, and the Socialists 2.

**NEW YORK, COLLEGE OF THE CITY OF.** A municipal institution for the education of men in New York City. In the fall of 1916 there were 2044 students in the day session of the college, 2726 in the evening session, 1416 in the day session of the preparatory department, and 3000 in extension courses. Besides instructors and tutors the faculty numbered 75. Dr. Camillo von Klenze, of Brown University, was appointed professor of German. For the year 1916 the city appropriated a budget of \$696,119 for the use of the college. The library contains 66,000 volumes. During the year, Mr. George McAneny was appointed a member of the board of trustees, and subsequently was elected chairman of the board. By amendment to the city charter, the college was authorized to offer gratuitously or otherwise, to men and women in New York, courses in vocational subjects and civic administration. President, Sidney Edward Mezes.

**NEW YORK BARGE CANAL.** See CANALS.

**NEW YORK CITY.** See ARCHITECTURE; BUILDING OPERATIONS; CHARITIES; CITY PLANNING; NEW YORK, section *New York City*

**NEW YORK, NEW HAVEN, AND HARTFORD RAILROAD.** See TRUSTS.

**NEW YORK PHILHARMONIC SOCIETY.** See MUSIC, *Orchestras*.

**NEW YORK SYMPHONY SOCIETY.** See MUSIC, *Novelties*.

**NEW YORK UNIVERSITY.** A non-sectarian educational institution in New York City, founded in 1831. In some departments it is co-educational. In the fall of 1916 there were 7797 students and 465 faculty members. The

productive funds amounted to \$1,394,657 and the total income to \$720,343. During the year Dr. Samuel A. Brown was appointed dean of the university and Bellevue Hospital Medical College. A new course in diplomacy was established and the Wall Street branch of the university moved into new quarters. The library contains 129,200 volumes. Chancellor, Elmer Ellsworth Brown.

**NEW ZEALAND, DOMINION OF.** An autonomous British dependency, composed of three principal and four smaller southern Pacific islands, with annexed groups of small islands and islets, many practically useless for settlement. The table below shows area, European population for comparative years, and Maori population, 1911 census:

	Sq. miles	Pop. 1901	Pop. 1911	Maoris
North Island.....	44,468	890,571	568,729	46,632
South Island.....	58,525	381,661	444,120	2,681
Stewart Island....	665	272	357	63
Total N. Z.....	103,658	772,504	1,008,206	49,376
Chatham Islands..	375	207	258	219
Kermadec Islands.	13	8	4	249*
Total .....	104,046	772,719	1,008,468	49,844

\* Maori wives of Europeans (enumerated in European census) scattered among the various islands.

Total area inclusive of outlying islands (with the Cook and other groups), 104,751 square miles. The total population in 1881 was 489,933, exclusive of Maoris; 1871, 256,393; 1861, 99,021; 1858, 59,413. In 1911 the rural population numbered 496,779, or 49.26 per cent of the total; the borough population, 505,598, or 50.14 per cent. In the rural population are included inhabitants of towns not constituted municipal boroughs, while with the urban population are classed persons in outlying districts who frequently follow agriculture pursuits. Remaining population is accounted for by number of persons on shipboard, railways, and in adjacent islands not included in any country or borough. The city of Auckland had (1911) 40,536 inhabitants, 102,676 with suburbs; Wellington (the capital), 64,372 and 70,729; Christchurch, 53,116 and 80,193; Dunedin, 41,529 and 64,237; Invercargill, 12,782 and 15,858; Wanganui, 10,929 and 14,702; Napier, 10,537 and 11,736; Timaru, 11,280; Palmerston North, 10,991; Gisborne, 8196.

Of the total population (1911) of all races (1,058,312), 558,385 were males, 499,927 females. Population of Cook and other annexed Pacific islands, 12,598 (6449 males and 6149 females). Total population of New Zealand proper (North, South, and Stewart islands), the dependencies (Chatham and Kermadec groups), and of Cook and other annexed Pacific islands, 1,070,910; average per square mile, 9690 (7427 in 1901; 4693 in 1881; 1641 in 1864). Protestants are greatly in the majority and of these the predominant church is the Church of England, with 413,842 adherents (or 41.14 per cent of the whole), the Presbyterian next, with 234,662.

Persons classed as actively engaged in agricultural pursuits numbered 130,581 (exclusive of dependents); among these are included those occupied in mines and quarries 14,775, and in fisheries 925; in pastoral pursuits 55,287; in

soil cultivation, etc., 54,738; in forestry, or the acquisition of raw products yielded by natural vegetation, 3376; in water-conservation, 389. Persons actively engaged in industrial pursuits, 133,555; commercial, 65,762; domestic, 44,267; transport and communications, 36,433; professional, 32,716; various, 10,803; not stated, 300. Non-breadwinners (dependent wives and children, etc., and persons supported by public or private charity), 554,051.

**PRODUCTION.** The climate is temperate and very healthful, the average death rate being less than 10 per 1000. The temperature is more equable than in the British Isles. While the summers are as cool as those of England, the winters are as warm as those of Italy. The mean annual temperature at Auckland (59°) is nearly the same as at Rome; at Wellington (56°) nearly the same as at Milan; at Dunedin (51°) nearly the same as at London. The extreme range of temperature at Wellington is 50° from 82° in summer to 32° in winter. The rainfall varies from a mean for the year of 25 inches on the east coast, to 116 inches on the west coast of the South Island; and from 37 inches on the east coast, to 59 inches on the west coast of the North Island.

The average birth rate for the 10 years 1905-14 was 26.71 per 1000 living, and the average death rate for the same period 9.51. The birth rate in 1914 was 25.99 per 1000, the death rate in that year was 9.31.

All the products of the temperate climates of Europe and Asia can be cultivated with success in New Zealand. There are extensive coal mines and rich gold fields. The gold entered for exportation from the Dominion up to Dec. 31, 1914, was valued at £82,953,910. The wool exported in 1914 amounted to 220,472,898 pounds, valued at £9,318,114. In 1855 it amounted to 1,772,344 pounds, valued at £93,104. The trade in frozen meat, which began in 1882 with an export of 15,244 cwt., valued at £19,339, had developed an export for 1889 of 656,822 cwt., valued at £783,374; in 1893 of 903,836 cwt., valued at £1,085,167; and in 1898, 1,551,773 cwt., valued at £1,698,750; in 1903, 2,378,650 cwt., valued at £3,197,043; in 1908, 2,120,303 cwt., valued at £3,188,515; in 1910, 2,654,196 cwt., valued at £3,850,777; in 1911, 2,250,565 cwt., valued at £3,503,406; in 1912, 2,573,238 cwt., valued at £3,909,569; in 1913, 2,578,693 cwt., valued at £4,449,933; and in 1914, 3,229,973 cwt., valued at £5,863,062. The live stock in New Zealand, as returned in 1911, were: horses, 404,284, against 99,859 in 1874; cattle, 2,020,171, against 494,917 in 1874; sheep (1916), 24,607,868, against 11,704,853 in 1874. The number of acres under crops in October, 1914, was 1,380,348, exclusive of 14,214,741 acres in sown grasses; 229,600 acres were in wheat having an estimate yield of 6,644,336 bushels; 287,561 acres were in oats, estimated yield 11,436,301 bushels.

**COMMERCE AND COMMUNICATIONS.** In the table below is shown the trade with the United Kingdom, the colonies, other countries, and totals for three years:

Imports:	1910	1911	1914
U. K. ....	£10,498,771	£11,787,800	£11,935,946
Colonies .....	8,967,053	4,710,040	5,868,838
Other .....	2,585,759	3,048,539	4,206,312
Total .....	£21,751,583	£19,546,379	£21,856,096

Exports:	1910	1911	1914
U. K. ....	£18,638,118	£15,134,743	£21,388,991
Colonies .....	2,468,119	2,966,952	2,724,965
Other .....	1,078,972	926,795	2,152,591
<b>Total</b> .....	<b>£22,180,209</b>	<b>£19,028,490</b>	<b>£26,261,447</b>

According to the newspaper reports in October both exports and imports reached record figures, the former being \$165,891,340, or a gain of 30 per cent over the year before, and the latter \$117,718,985, a gain of 26 per cent over the year before.

At the end of March, 1915, there were 2954 miles of government and 29 miles of private railways in operation in New Zealand, and 170 miles of government line under construction. The construction of new lines and the extension of existing ones is still steadily proceeding. The expenditure on the 2954 miles of government railways has been £33,909,340, or an average of £11,557 a mile. This includes all charges connected with the construction and equipment of the lines. The revenue from the government railways for the years 1914-15 was £4,105,457, and the working expenses £2,920,455. The gauge throughout is 3 ft. 6 in.

There were on March 31, 1916, 2970 miles of railway in New Zealand. The construction cost of these lines at the close of the fiscal year 1915-16 was \$181,691,167, with gross earnings for the year of \$22,134,574. The net profits were \$7,768,762. During the fiscal year 1915-16, \$4,750,843 was expended on improvements on the New Zealand government railways.

Of telegraphs and interurban telephone circuits there are 13,434 miles of land lines and 46,778 miles of wire, constructed at a cost of over £2,500,000. There are five submarine cables connecting the two islands of New Zealand; two, Wakapuaka-La Perouse; one, Auckland-Sydney; and one Auckland-Brisbane, via Norfolk Islands, connecting the Dominion with Australia.

**FINANCE, ETC.** In the table below are shown financial statistics for comparative years:

	1909-10 *	1911-12	1914-15
Revenue .....	29,288,917	211,032,544	212,451,945
Expenditure .....	8,990,922	10,340,368	12,876,803

\* Financial year ending March 31.

Gross public debt March 31, 1915, £100,059,910; accrued sinking fund, £3,178,055; net debt, £94,644,455.

A governor administers the Dominion.

**HISTORY.** The Prime Minister, Mr. Massey, paid a visit to England and in the middle of October, in the course of public addresses, referred to the problem of employment for discharged soldiers. New Zealand, he said, was already trying to deal with that difficult situation. He declared himself in sympathy with the movement for closer imperial relations, saying that he believed that this was desired in all outlying parts of the Empire. Mutual interests pointed to the necessity for closer and larger commercial relations. He also referred to the need of certain alterations in the constitutional system of the Empire in order to give the Dominion a voice in measures of defense and foreign policy. The attitude of the population toward enlistment had been shown in the preceding November when a national register showed that 110,000 men were ready to serve in the expeditionary forces if called upon, 43,500 to perform

non-military duties, and 34,386 unwilling to render any war service. The House of Representatives passed a military service bill in June by a vote of 44 to 4, establishing compulsory service. Measures for raising the necessary revenue included high additional taxation on land and incomes, and an increase of railway, postal, and telegraph rates and of customs duties.

**NICARAGUA.** A Central American republic, between Honduras on the north and Costa Rica on the south. On the east is the Caribbean Sea, and on the southwest the Pacific Ocean. The capital is Managua, situated on the southern shore of Lake Managua, in the western part of the republic.

**AREA, POPULATION, ETC.** Nicaragua is the largest of the Central American republics, having an estimated area of 128,340 square kilometers (49,552 square miles), which is about the size of the State of New York. The number of inhabitants is not known with accuracy, but in 1910 was estimated at about 600,000. An estimate reported for Dec. 31, 1914, is 703,540. The people, of whom probably three-fourths live in the western half of the country, are principally mestizo or Indian. The largest city is León, the former capital, with an estimated population of about 63,000. Managua is supposed to have about 40,000 inhabitants; Granada, 25,000; Matagalpa, 16,000; Bluefields, the chief eastern seaport and the centre of the banana trade, 15,000; Masaya, 15,000; Chinandega, 13,000. The chief Pacific port is Corinto.

The schools of Nicaragua have recently shown some progress, but illiteracy is general. The number of elementary schools is stated at 356. Ten "colleges" provide secondary education, and there are two so-called universities, one at León and one at Managua. Most of the people profess Roman Catholicism.

**PRODUCTION AND COMMERCE.** Nicaragua is capable of considerable agricultural development and it has valuable timber and mineral resources, but means of transport are inadequate, the inhabitants are lacking in industrial initiative, and unstable political conditions have discouraged foreign investments. Mining is almost limited to gold, which has contributed largely to the actual wealth of the country. There is some exploitation of dyewoods, mahogany, and cedar. The principal crops are bananas (in the Bluefields region), coffee (in the western districts), sugar cane, corn, and beans, while also of some importance are coconuts, rice, tobacco, cacao, and various fruits. Grazing, especially in the northwest, is a profitable industry; the number of cattle has been estimated at 1,200,000, though perhaps this figure is too large.

Imports and exports in 1915 were valued at \$3,159,220 and \$4,567,201 respectively, as compared with \$4,134,323 and \$4,995,050 in 1914. Valued in thousands of dollars, imports and exports have been as follows:

	1905	1910	1913	1913	1914	1915
Imports...	3,447	2,856	4,967	5,770	4,134	3,159
Exports...	3,542	4,545	3,862	7,712	4,955	4,567

Leading imports in 1913 and 1914 respectively, in thousands of dollars: cotton goods, 1417 and 828; iron and steel manufactures, 787 and 521; flour, 224 and 337; chemicals, drugs, and medicines, 232 and 200; hides and skins and manufactures thereof, 223 and 186; liquors and other

beverages, 239 and 141. In 1913, the export of coffee amounted to 111,929 metric quintals, valued at \$5,004,449; in 1914, 103,508 quintals, \$2,295,397. Next in value to the coffee export is that of gold, which amounted to \$891,025 in 1914, as compared with \$1,063,077 in 1913, \$907,134 in 1912, and \$931,938 in 1911. The banana export in 1913 was 1,393,026 bunches, valued at \$429,802; in 1914, 1,525,598 bunches, \$504,191. Other exports in 1913 and 1914 respectively, in thousands of dollars: woods (exclusive of dyewoods), 322 and 456; hides and skins, 327 and 401; rubber, 279 and 124; silver, 17 and 53; sugar, 32 and 47; cacao, 40 and 29; coconuts, 19 and 26.

Imports from the principal commercial countries, in thousands of dollars:

	1912	1913	1914	1915
United States .....	2,549	3,244	2,566	2,593
United Kingdom .....	989	1,151	718	802
France .....	256	401	254	138
Germany .....	604	619	392	37

Exports to these countries, in thousands of dollars:

	1912	1913	1914	1915
United States .....	1,767	2,722	2,428	3,080
France .....	626	1,763	1,156	601
United Kingdom .....	515	999	367	439
Germany .....	702	1,888	561	....

In 1914, imports and exports by principal ports were as follows, in thousands of dollars: Corinto, 2567 and 3247; Bluefields, 969 and 1062; San Juan del Sur, 306 and 149; Cabo Gracias, 207 and 335.

**COMMUNICATIONS.** Nicaragua has few good roads and (except about 20 miles of private railway) only one railway, in the western part of the country. The railway extends from Corinto to Chinandega, León, Managua, Masaya, Granada, and Diriamba. It is a 3 ft. 6 in. gauge line whose total length, with short branches, is 171 miles. It is owned by the state but leased to a New York company. Several new lines have been projected. On June 17, 1916, a contract was ratified by the Congress for a railway to connect the existing line with the Caribbean coast, the work to be completed within four years. Granada, on Lake Nicaragua, has steamer connection with San Juan del Norte, on the Caribbean. Reported length of telegraph wire, 3637 miles; 148 offices. Post offices, 151.

**FINANCE.** The standard of value since 1912 has been gold. The monetary unit is the córdoba, equivalent to the American dollar. For 1914, the reported revenue and expenditure were \$3,355,676 and \$4,809,490 respectively. Customs receipts in 1914, \$1,234,633; in 1915, \$787,767. The foreign (English) debt stood at \$1,179,620 on Dec. 31, 1915.

**GOVERNMENT.** The constitution bears date of April 5, 1913. The executive authority is vested in a president, who, with a vice-president, is elected by direct vote for four years. The president is assisted by a cabinet of five members and is ineligible for the next term. The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (13 in number) are elected for six years, and deputies (40) for four years, all by direct vote. As a result of the revolution of 1910, a national congress on December 31st of

that year elected Gen. Juan J. Estrada President for two years, and Díaz Vice-President. Díaz succeeded to the executive office May 11, 1911, upon the resignation of Estrada, and on Nov. 2, 1912, as the unopposed Conservative candidate, was elected President for the term beginning Jan. 1, 1913. On Oct. 2, 1916, Emiliano Chamorro succeeded Adolfo Díaz as President.

In regard to the Canal Treaty with the United States the *Bulletin* of the Pan-American Union for May published the following item: "The Canal Treaty, which was ratified by the Chamber of Deputies in Managua on April 11th last by 27 affirmative votes out of 33 deputies present, seems to have had the immediate effect of greatly stimulating the business of the country. A number of important enterprises, which were kept in abeyance pending the final ratification of this treaty, now propose to make further investments in Nicaragua, and a notable revival in mining, agriculture, and industrial undertakings in the republic is confidently predicted in the near future." See UNITED STATES, *Treaties*.

**NICHOLAS, GRAND DUKE.** See WAR OF THE NATIONS.

**NICHOLSON, MEREDITH.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, American.

**NICHOLSON, THOMAS.** See METHODIST EPISCOPAL CHURCH.

**NICKEL.** See CHEMISTRY, INDUSTRIAL.

**NICOL, THOMAS.** A Scottish clergyman and theologian, died Aug. 7, 1916, at Aberdeen. He was born in 1846. His scholastic career was a brilliant one. In 1868 he took the M.A. at Aberdeen, with many honors, in 1871 graduated B.D. from Edinburgh, and subsequently he studied at Tübingen. He held charges in Scotland, lectured, and from 1886 to 1900 edited the *Church of Scotland Mission Record*. In 1899 he became professor of divinity and biblical criticism at Aberdeen, and this chair he held till his death. In 1914 he served as moderator of the Church of Scotland. His Croall and Baird lectures were published as, respectively, *Recent Archaeology and the Bible* (delivered 1897-98) and *The Four Gospels in the Earliest Church History* (delivered 1906-07).

**NIGER, MILITARY TERRITORY OF THE.** See MILITARY TERRITORY OF THE NIGER.

**NIGERIA, COLONY AND PROTECTORATE OF.** A British possession in West Africa, composed of the old protectorate of Northern Nigeria and the old protectorate and colony of Southern Nigeria, separated into three principal districts—colony proper (area, 1400 square miles), the Northern Provinces (255,700), and the Southern Provinces (78,000). The colored population is estimated to number in the neighborhood of 16,258,000; Europeans, 2600. The administrative headquarters of the colony and of the Southern Provinces is at Lagos, while that of the Northern Provinces is at present at Zungeru.

The principal tin fields are situated on the western boundary of the Central Province and in the provinces of Nassarawa, Zaria, and Kano adjoining that boundary. Tin also exists in the provinces of Ilorin, Calabar, and Yola, but as yet has not been found in payable quantities.

The pagan town of Bukuru may be taken roughly as the centre of the field (about 6000 feet above sea level), from which three great waterways of the Northern Provinces take their origin: Flowing westward the Niger River, becoming the Kwall, Danchandon, and eventually

the Kaduna; flowing northeast the Delimi River, that goes to Lake Chad; and flowing east the numerous tributaries of the Gongola, which joins the Benue, such as the Shen, Forum, Ropp, and Jarawa rivers. The ore won by the existing mines during 1913 amounted to 5530 tons, and in 1914 to 6143 tons. For 1914 the total imports were valued at £6,276,956 (£5,054,333 commercial and £1,222,623 government), and the total exports at £6,420,461 (£6,150,703 colonial products and £259,758 trans-shipped goods).

In June a religious movement of a dangerous character was reported to have spread over a considerable part of the Protectorate. It was especially strong among the negro tribes of the south. It had made itself manifest in 1915, but during the current year its spread had become rapid and it was said that about a million natives were involved in it. The leader was a fanatical negro who called himself Elijah II, and professed the ability to raise the dead and work other miracles.

**NIJINSKI, WARLAW.** See MUSIC, *Ballet*.

**NITRATE OF SODA.** See FERTILIZERS.

**NITRATE PLANT, GOVERNMENT.** See MILITARY PROGRESS, *United States*, material development.

**NITROGEN.** See CHEMISTRY, INDUSTRIAL; FERTILIZERS.

**NIVELLE, ROBERT.** See FRANCE, *History*; WAR OF THE NATIONS.

**NOBEL PRIZES.** It is necessary to correct a report received prior to the publication of the 1915 YEAR BOOK that the Nobel Prize in literature for that year was divided among Romain Rolland, Henrik Pontoppidan, T. F. Troels-Lund, and Verner von Heidenstam. The prize was awarded to the first three of these four. The prize for 1916, however, was awarded to Verner von Heidenstam (q.v.). Up to the end of the year the other prizes had not been awarded. Scientific research has been greatly affected by the European war, so that there has been difficulty in awarding the prizes for physics, chemistry, and medicine. The possibility that Pope Benedict XV would receive the peace prize for 1916 because of his efforts to bring the European war to an end has been mentioned frequently and King Alfonso of Spain was also mentioned.

**NORBECK, PETER.** Elected Republican Governor of South Dakota, Nov. 7, 1916.

**NORFOLK MUSIC FESTIVAL.** See MUSIC, *Festivals*.

**NORRIS, KATHLEEN.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, American.

**NORSWORTHY, NAOMI.** An American educator, died in New York City, Dec. 26, 1916. She was born in New York in 1877 and was educated at the New Jersey State Normal School, from which she received a State diploma in 1896. She received the degree of Bachelor of Science and a higher diploma from Teachers' College, Columbia University, in 1901; and graduated Ph.D. from Columbia in 1904. She taught in the public schools at Morristown, N. J. (1896-99), and was successively assistant (1901-02), tutor (1902-04), and instructor (1904-09) in psychology in Teachers' College; and thereafter adjunct professor of psychology at Columbia. She was the author of a book on *The Psychology of Mentally Deficient Children* (1906).

**NORTH CAROLINA. POPULATION.** The estimated population of the State on Dec. 31,

1916, was 2,418,569. The population in 1910 was 2,206,287.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	2,900,000	53,650,000	\$59,015,000
1915	2,900,000	60,900,000	48,898,000
Wheat . . . . . 1916	950,000	9,975,000	17,556,000
1915	950,000	9,810,000	11,772,000
Oats . . . . . 1916	375,000	6,562,000	4,856,000
1915	350,000	8,050,000	4,991,000
Rice . . . . . 1916	300	6,000	5,000
1915	200	4,000	3,000
Potatoes . . . 1916	84,000	3,280,000	4,522,000
1915	85,000	3,150,000	2,800,000
Hay . . . . . 1916	390,000	a 507,000	8,872,000
1915	350,000	648,000	10,692,000
Tobacco . . . 1916	320,000 b	176,000,000	85,200,000
1915	320,000	198,000,000	22,221,000
Cotton . . . . 1916	1,482,000	646,000	59,742,000
1915	1,282,000	c 699,000	37,855,000
Rye . . . . . 1916	55,000	584,000	694,000
1915	50,000	575,000	604,000
Sweet potatoes . 1916	87,000	9,809,000	6,982,000
1915	85,000	8,925,000	4,998,000

a Tons. b Pounds. c Bales.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . . . . .	4,931	5,507
Average number of wage earners . . . . .	121,478	186,844
Capital invested . . . . .	\$217,185,000	\$258,842,000
Wages . . . . .	34,855,000	46,039,000
The value of materials used . . . . .	121,861,000	169,942,000
The value of products . . . . .	216,656,000	289,412,000

**MINERAL PRODUCTION.** North Carolina ranks first among the Southern States in the production of gold. The total mined in 1915 was 8320 fine ounces, compared with 6043 in 1914. There was also a small silver production.

**TRANSPORTATION.** The total railway mileage of the State in 1916 was 4955. The lines having the longest mileage are the Southern Railway, 1364; the Atlantic Coast Line, 952; the Norfolk Southern Railway Company, 688; and the Sea Board Air Line, 610.

**EDUCATION.** The latest figures available for education are for the year 1914-15. In that year there were in the State 778,283 children of school age, of whom 525,107 were white, and 253,276 colored. The enrollment of white children was 409,728, and of colored children 189,918. The average daily attendance of white children was 288,134, and of colored children 119,630. There were 13,255 teachers, of whom 10,082 were white. The total expenditures for that year were \$5,566,992.

**FINANCE.** There was a balance in the treasury on Dec. 1, 1915, of \$133,435. The total receipts for the year amounted to \$5,227,230, and the disbursements to \$5,002,607, leaving a balance on Dec. 1, 1916, of \$224,623.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include hospitals at Morgantown, Raleigh, and Goldsboro, Epileptic Colony, School for the Blind, School for the Colored Blind and Deaf, Soldiers' Home, State

Prison, School for the White Deaf at Morgantown, Jackson Industrial and Manual Training School at Concord, and Orphanage for White Children and Orphanage for Colored Children at Oxford.

**POLITICS AND GOVERNMENT.** There was no meeting of the Legislature in 1916, and there was little interest in politics, outside purely local issues. There was no doubt as to the issue of the election for State officers. Thomas W. Bickett was nominated by the Democrats for Governor, and Frank W. Linney by the Republicans. In the election on November 7th Mr. Bickett was elected by a vote of 167,661, compared with 120,457 for Mr. Linney. In the election for President, Wilson received 168,383 votes, and Hughes 120,890. All the Democratic State officers were elected, and the Democrats elected all their candidates for Congress.

In the shooting of Jasper Allen in Carey County, on March 17, 1916, the career was ended of the last of the famous Allen clan, who, in 1912, created a reign of terror by killing five persons in the Carey County court house at Hillville, Virginia. Those who were killed at that time included Judge Thornton Massie, the county prosecutor, William M. Foster, the sheriff of the county, a juror, and a witness. Two members of the Allen clan were on trial at the time for disorderly conduct. The raid on the court was made with the object of liberating the prisoners. For this crime two of the Allens were executed, on May 28, 1913, six others received long terms of imprisonment, one was acquitted, and one turned State's evidence. Jasper Allen, whose death is noted above, was shot and killed by Will McGraw.

**STATE OFFICERS.** Governor, Thomas W. Bickett; Lieutenant-Governor, O. Max Gardner; Secretary of State, J. B. Grimes; Treasurer, B. R. Lacy; Auditor, W. P. Wood; Adjutant-General, Lawrence W. Young; Attorney-General, James M. Manning; Superintendent of Education, J. Y. Joyner; Commissioner of Agriculture, W. A. Graham; Commissioner of Insurance, J. R. Young—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Walter Clark; Justices, George H. Brown, William A. Hoke, William R. Allen, P. D. Walker; Clerk, J. L. Seawell.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Democrats .....	41	97	188
Republicans .....	9	22	81
Independent .....	..	1	1
Democratic majority..	82	74	106

**NORTH CAROLINA, UNIVERSITY OF.** A State educational institution at Chapel Hill, N. C., founded in 1795. In the fall of 1916 there were 1261 students and 97 faculty members. The productive funds of the institution amounted to \$182,594 and the income to \$261,658. The library contains 76,000 volumes. President, Edward Kidder Graham.

**NORTH DAKOTA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 752,260. The population in 1910 was 577,056.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by

the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn .....	1916 510,000	13,515,000	\$11,853,000
	1915 700,000	9,800,000	6,566,000
Wheat .....	1916 7,150,000	89,325,000	59,774,000
	1915 8,350,000	151,970,000	132,214,000
Oats .....	1916 2,500,000	53,750,000	23,650,000
	1915 2,450,000	98,000,000	26,460,000
Potatoes ...	1916 75,000	6,975,000	8,021,000
	1915 80,000	7,200,000	2,952,000
Hay .....	1916 520,000	884,000	5,304,000
	1915 440,000	660,000	3,762,000

The value of materials used ..	12,674,000	14,484,000
The value of products .....	19,137,000	21,147,000

**TRANSPORTATION.** The total railway mileage in the State in 1916 was 1460. The railways having the longest mileage of main track are the Great Northern, 426, the Northern Pacific, 377, and the Minneapolis, St. Paul, and Sault Ste. Marie, 361.

**EDUCATION.** The total population of the State in 1916 was 186,341. The total enrollment in the graded schools was 138,671, and in high schools, 9500. The average daily attendance was 124,996. The male teachers numbered 1329, and females numbered 6664. The average monthly salary of male teachers was \$74.99, and of females, \$59.84. See also UNIVERSITIES AND COLLEGES, *Surveys*.

**FINANCE.** The latest statistics for finance are for the fiscal year 1915. The receipts for that year from all sources amounted to \$4,704,229, and the disbursements to \$5,436,016, leaving a balance at the end of the year of \$901,639, which includes a balance at the beginning of the year of \$1,633,417. The State departments are under the budget system.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the State Reform School at Mandan, State Penitentiary at Bismarck, Hospital for the Insane at Jamestown, Institute for Feeble-Minded at Grafton, School for the Blind at Bathgate, School for the Deaf at Devils Lake, Tuberculosis Sanatorium at Duneith.

**POLITICS AND GOVERNMENT.** North Dakota underwent a political revolution in 1916 and the State Judiciary, the Governor, all other State offices, and both branches of the Legislature are now under the control of the farmers, directed by recognized Socialists. Certain features of the campaign were unique. To understand it one must be familiar with preceding conditions. It was made possible by two things, an internecine warfare within the Republican ranks of North

Dakota, covering a period of 12 or 14 years, and a newspaper agitation that made the situation ripe for the political coup. Factional differences in the Republican party divided it into two wings known as the stalwart faction and the insurgents. Prior to 1912, by a combination with the Democrats, the insurgents captured practically all State offices except Governor and controlled the Legislature. The Democrats were given the governorship for six years. In 1912 L. B. Hanna, former Congressman, was elected Governor as a result of a get-together movement among the Republicans, and with a division of offices between the stalwarts and insurgents there was no trouble in gaining another Republican victory in 1914.

The Farmers' Equity Union, which was established in the State 10 or 12 years ago, gained great strength during the last six years. The members advocated a State-owned terminal elevator in Duluth, St. Paul, or Minneapolis. There was opposition to this plan by those favoring a terminal elevator but wanting it erected within the State and others who antagonized any proposition involving State-ownership theories. In the 1914 election the voters of the State endorsed the terminal elevator plan, but the succeeding Legislature, having a majority opposed to the idea, did not carry out the wishes of the voters. This aroused the farmers to a high degree of indignation and, with the agitation by public speeches and by the newspapers, conditions were created which made the political revolution possible. Charles Edward Russell, the Socialist writer, is credited with furnishing the plan that made the revolution a success. He is said to have spent some months in the State in the latter part of 1915 in conference with the different agitators and in combining the different groups into one organization. A. C. Townley, A. E. Bowman, F. B. Wood, widely known in State socialistic circles, and D. C. Coates, a socialistic organizer in Colorado and Washington State, have been the chief promoters of the plan. They first started to organize a socialistic movement and after making some progress changed their plans and organized the farmers into a Non-Partisan League, keeping Socialism as much in the background as possible.

By April, 1916, 35,000 farmers had joined the league, paying a membership fee of \$9. The leaders called a State convention of one Representative from each legislative district. These nominated a State ticket composed of men of former Republican affiliations in every case except the candidate for treasurer. The State-wide primaries in June endorsed the Non-Partisan League slate, the candidates receiving more votes than the combined opposition. So overwhelming was the victory that the Non-Partisan League completely captured the State Republican organization, including the State central committee. The ticket was elected in November.

The league announced its intention to support only candidates for the judiciary, the State offices, and the Legislature, but diverted sufficiently from that to support United States Senator McCumber for reelection. It did not participate in the election of county candidates nor did it advocate openly any presidential candidate. Secretly its support was thrown to Wilson and the State presented the anomalous position of electing a Republican Governor over the Democratic candidate four to one, a Republican

Senator over the Democratic Senator by an overwhelming majority, but giving the Democratic candidate for President a safe majority over the Republican standard bearer. For Governor, L. J. Frazier, Republican, received 87,665 votes and McArthur, Democrat, 20,351; for President, Wilson received 55,206 and Hughes, 53,471. Senator McCumber was reelected.

The Non-Partisan League, in full control of the judicial, executive, and legislative departments of North Dakota, planned an extensive line of legislation, largely along State-ownership and paternal lines. The ownership by the State of terminal grain elevators, State packing plants, flour mills, banks, trust companies, and other organizations, compulsory hail insurance, with a fixed tax against every acre of land, whether cultivated or uncultivated, a different form of taxation requiring the levy of practically all taxes on lands to the exclusion of farm improvements, a large tax on public utilities, with a general cleaning out of all State officials from the heads down to the stenographers and janitors, was the programme of the league for the coming legislative session.

The lower branch of the Legislature became Non-Partisan by about four to one, and the Senate almost equally divided. The results of the campaign were to intensify class feeling and to outline class legislation, with socialistic leanings, to a degree never before conceived in the State.

The league has carried its organization into Minnesota, South Dakota, and Montana, and announced its intention to organize these States along the same lines as in North Dakota. The membership fee was increased to \$16.

**STATE OFFICERS.** Governor, Lynn J. Frazier; Lieutenant-Governor, A. T. Kraabel; Secretary of State, Thomas Hall; Treasurer, John Steen; Auditor, Carl Kositzky; Attorney-General, William Langer; Superintendent of Education, N. C. MacDonald; Commissioner of Agriculture, John N. Hagan; Commissioner of Insurance, S. A. Olsness—all Republicans.

**JUDICIARY.** Supreme Court: Chief Justice, Andrew A. Bruce; Associate Justices, J. E. Robinson, L. E. Birdzell, and R. H. Grace.

**STATE LEGISLATURE.**

	Senate	House	Joint Ballot
Republicans .....	43	97	140
Democrats .....	6	16	22
Republican majority..	37	81	118

**NORTH DAKOTA, UNIVERSITY OF.** A co-educational State institution at Grand Forks, N. D., founded in 1883. The post office address is University, N. D. There was an enrollment of 909 students in all departments in the fall of 1916 and the faculty numbered 74. During the year the university lost by death Prof. George St. John Perratt, head of the department of Latin. The Greek and Latin courses were consolidated under a department of classical languages, with Prof. Gottfried E. Hult as head of the new department and Dr. Fred E. Smith as instructor. For 1916 the productive funds of the institution amounted to \$1,725,000 and the income from these funds to \$60,000. The library contains 60,000 volumes. President, Frank Le-Rond McVey. See UNIVERSITIES AND COLLEGES.

**NORTHERN TERRITORY.** A territory of the Commonwealth of Australia, occupying

the central and northern part of the continent between Queensland on the east and Western Australia on the west. The territory was transferred from South Australia to the Commonwealth Jan. 1, 1911. Its area is 523,620 square miles, which is about 17.6 per cent of the area of the Commonwealth. The population, according to the 1911 census, was 3310 (2734 males, 576 females), exclusive of full-blooded aborigines; there was a decrease of 31.2 per cent, the population in 1901 numbering 4811; estimate of June 30, 1915, 4448. The number of full-blooded aborigines, more or less civilized, returned by the 1911 census was 1223. Estimates of the total black population vary from 20,000 to 50,000. The capital is Darwin (population, 958 in 1911), from which a railway (3 ft. 6 in. gauge) extends 145.5 miles to Pine Creek. Administrator of the territory, J. A. Gilruth.

**NORTHWESTERN COLLEGE.** An institution for higher education, situated at Naperville, Ill. It was founded in 1861 and incorporated in 1876. It is a religious institution supported by the Evangelical Association, but is non-sectarian in its requirements for admission. It is a member of the North Central Association of Colleges. It has a faculty of 29 professors and lecturers and in 1916 had 291 regular college students besides 110 additional students. The number of regular college students is increasing. The value of the college property is over \$500,000. The expenditures in 1915-16 amounted to \$42,100.

**NORTHWESTERN UNIVERSITY.** A Methodist Episcopal educational institution at Evanston, Ill., founded in 1861. The total enrollment in the fall of 1916 was 5898 and the faculty numbered 452. Thomas Franklin Holgate was appointed president ad interim; Ulysses Sherman Grant, acting dean of the College of Liberal Arts; Dr. Arthur Isaac Kendall, acting dean of the Medical School. During the year a History Building was erected at a cost of \$173,496, given by Norman Wait Harris (q.v.). An endowment fund for maintenance of \$50,000 was raised. The total endowment, restricted and unrestricted, amounts to \$5,198,277, from which the university draws about 4 per cent income. The library contains 203,603 volumes. See UNIVERSITIES AND COLLEGES.

**NORTHWEST PROVINCES.** The Canadian provinces of Manitoba, Saskatchewan, and Alberta. See these titles and also CANADA.

**NORTHWEST TERRITORIES.** That portion of Canada not comprised within any province or the Yukon Territory. From the latter it extends eastward, the southern boundary being the 60th parallel as far as Hudson Bay. The Territories include Baffin Island and other large islands north of the continent. The area is 1,207,926 square miles, of which 34,298 water. Prior to 1912 the area was 1,921,685 square miles; in that year 178,100 square miles were annexed to Manitoba, 146,400 to Ontario, and 354,961 to Quebec. The population is very sparse and the means of subsistence scanty. The number of inhabitants as returned by the 1911 census was 18,481; this number was reduced by the annexations of 1912 to about 5900. The Territories are administered by a commissioner, assisted by a council of four members. The Commissioner is the head of the Royal Northwest Mounted Police. See CANADA, *Area and Population*.

**NORWAY.** A constitutional European monarchy, situated in the western portion of the Scandinavian Peninsula. Capital, Christiania.

**AREA AND POPULATION.** The total land area is 119,549 square miles; the total area including fresh waters, 124,675. The total *de facto* population, Dec. 31, 1910, was 2,357,790; *de jure* population, 2,391,782 (estimated Dec. 31, 1912, 2,439,209). Of the total *de facto* population, 1,662,513 resided in the rural communes, and 695,277 in towns. Males numbered 1,123,160, females 1,234,630. Agriculture and allied industries supported 898,259; fisheries, 134,685; mines, furnaces, etc., 247,077; manufactures, etc., 238,722; small enterprises and public utilities construction, 111,832; commerce, banks, and internal transportation, 279,866; navigation, 77,636; public administration and the liberal professions, 109,492; domestic labor, 101,865; without occupation, 45,701. Total population over 15 years of age, 1,525,564. In 1914 the marriages numbered 15,700, births 61,600 (4300 illegitimate), deaths, 32,900, emigrants 8522. Christiania had (1910) 241,834 inhabitants (*de jure*); Bergen, 76,867; Trondhjem, 45,335; Stavanger, 37,261. Lutherans are in the majority. All creeds are tolerated. Jesuits are debarred.

**PRODUCTION.** The agriculture census returned 1,111,949 acres under cultivation, 854,701 under sown and natural grasses, and 69,114 under forest. The total value of sown crops in 1911 was reckoned at 184,907,600 kroner (cereals, 36,497,200; potatoes, 35,604,400; hay, 112,806,000); in 1910, at 200,712,400; in 1908, at 270,872,500; in 1905, at 220,836,100; in 1903, at 211,927,000. The cereal production by no means keeps up with the consumption; in 1910 the total cereal production (including dried legumes) was 292,691,000 kilos; the total cereal import, 598,355,000 kilos. Potato yield in 1910, 568,289,000 kilos; import, 13,122,000 kilos. The following table shows the area in hectares and the production (1916 provisional) in quintals of main cereal crops in 1915 and 1916, with quintals per hectare in 1915:

	Hectares		Quintals		Qa.
	1915	1916	1915	1916	
Wheat ...	5,024	5,526	77,859	88,059	15.4
Rye .....	15,168	19,718	210,456	185,214	13.9
Barley ...	36,182	39,800	614,285	658,923	17.0
Oats .....	109,105	120,015	1,745,055	1,584,858	16.0

The 1915 live stock returns were as follows: 187,048 horses, 1,122,934 cattle, 1,335,870 sheep, 239,027 goats, 208,965 swine. Poultry is raised in considerable numbers. Persons employed in the 670 creameries, 68 cheese, and 4 condensed-milk factories, etc., 1021 men and 1710 women; these establishments receive during the average year 277,761.762 kilograms of milk and turn out 3,707,231 kilos of butter and 7,796,739 kilos of cheese.

The cod fisheries employed, in 1913, 96,693 fishermen. Value of output, 25,508 kroner; value of output of herring fisheries, 13,244,000 kroner; mackerel, 2,495,500; salmon and sea trout, 1,051,100; other fish, 8,334,000; lobsters, 1,115,600.

The mines in 1913 employed 7652 persons and produced ores valued at 21,472,000 kroner. Industrial establishments at end of 1913 numbered 6500, employing 143,917 persons.

**COMMERCE.** By royal decree of Aug. 2, 1914,

the export of cereals and flour has been prohibited, and that of raw cotton since May 23, 1915. As regards goods in transit, articles destined for a foreign (non-Norwegian) port may be re-exported without special permission, even if on the list of prohibited exports. The Norwegian government reserves the right to grant permission to export any of the prohibited articles in exceptional cases. Below is shown the trade for comparative years in kroner:

	1912	1913	1914
Imports	525,735,200	552,433,600	567,276,700
Exports spec.	324,622,600	380,912,100	394,390,000
Exports transit *	11,050,000	11,700,800	15,631,600

\* 1912 and 1913, direct transit not included.

The following table shows in thousands of kroner leading imports for consumption, and exports of domestic produce for the year 1914:

Imports	1000 kr.	Exports	1000 kr.
Cereals, etc.	74,225	Animal prods.	125,154
Ores	72,184	Timber	85,008
Machinery	71,641	Grease, etc.	87,521
Oils, etc.	44,826	Hair, skins	32,649
Textiles	48,813	Paper, etc.	30,151
Metal mfrs.	41,078	Metals	27,114
Provisions	38,532	Mineral mfrs.	20,592
Metals	37,847	Minerals, raw	19,482
Yarn, etc.	27,876	Ships	7,329
Wooden wares	18,798	Live animals	3,018
Animal prods.	17,585	Rope, etc.	1,975

The United Kingdom contributed imports valued at 159,185,800 kroner and received exports valued at 112,143,400 kroner; Germany, 151,298,800 and 92,726,400; Sweden, 78,684,500 and 34,930,200; Russia and Finland, 21,663,500 and 11,677,000; United States, etc., 83,749,400 and 70,230,800; Denmark, 33,641,800 and 20,217,100; France, 10,586,800 and 10,746,900; Netherlands, 22,007,300 and 15,983,700; Belgium, 12,757,100 and 9,397,700.

Vessels entered during 1914 numbered 10,103, of 5,720,888 tons; cleared, 10,130, of 5,638,836 tons. There were, Jan. 1, 1915, in the merchant marine, 2464 steamers, of 1,225,966 tons, and 950 sailing, of 561,921.

COMMUNICATIONS. On Dec. 31, 1915, there were 1967 miles of railway in operation (1685 state). Post offices, 3496. State telegraph and telephone lines (June 30, 1914), 12,505 miles; wires, 55,859; offices, 1582.

FINANCE. The krone (worth \$0.268) is the monetary unit. In the following table are shown revenue and expenditure for comparative years:

	1910-11	1911-12	1913-14
Revenue	128,279,596	140,780,210	175,962,000
Expenditure	120,905,430	132,932,368	166,716,000

The 1915-16 budget is detailed below, amounts in thousands of kroner:

Revenue	1000 kr.	Expenditure	1000 kr.
Customs	50,500	Railways	29,775
Income tax	24,000	Defense	29,501
Railways	30,798	Finance	6,619
Post office	11,100	Instruction	18,070
Tels. and tels.	8,800	Justice	5,355
Domains	6,521	Interior	14,081
Excise *	5,060	Highways	7,479
Excise †	4,000	Debt	5,659

NAVY. See NAVAL PROGRESS.

GOVERNMENT. The executive power is vested in a king (Haakon VII, elected Nov. 18, 1905), aided by a council of state composed of responsible heads of departments. The Storthing (representative), made up of the Lagthing and the Odelsting, is the legislative body.

Heir-apparent, Prince Alexander, born July 2, 1903; renamed Olaf upon his father's accession to the throne.

HISTORY. The Storthing assembled in January, and on February 3rd defeated by a vote of 108 to 18 a Socialist motion for the denunciation of the treaty of 1907, in which Great Britain, Russia, France, and Germany guaranteed Norway's integrity. A constitutional amendment was adopted by a vote of 91 to 14 rendering women, who had already by the law of 1914 become eligible to the Storthing, also eligible to the Council of State. The iron miners went on strike in January.

Discontent among the workmen was caused by the bill for compulsory arbitration in labor disputes, which was pending in Parliament. A lockout had been declared in many trades by the Norwegian Employers' Association, and on account of the many strikes in the mining and iron industries, the lockout was enforced. A call for a general strike as a protest against the bill met with a response on June 7th from about 80,000 workmen. The bill was passed nevertheless, but the Socialists intervened and called off the strike. On June 15th the men returned to work.

See ARBITRATION, INDUSTRIAL.

NORWEGIAN LITERATURE. See SCANDINAVIAN LITERATURE.

NOTRE DAME, UNIVERSITY OF. A Roman Catholic institution for the education of men at Notre Dame, Ind. It was founded in 1842. In the fall of 1916 there were 1225 students in the university and the faculty numbered 80. The library contains 90,000 volumes, and in 1916 a new library building, costing \$225,000, was completed. President, Rev. J. Cavanaugh, C.S.C.

NOTT, CHARLES COOPER. An American jurist, died in New York City, March 6, 1916. He was born in Schenectady, N. Y., in 1827, graduated from Union College in 1848, and practiced law in New York until the outbreak of the Civil War. He served in the Union army as captain and then as colonel, and for 13 months, after his capture at Brashear, La., was a Confederate prisoner in Texas. President Lincoln in 1865 appointed Mr. Nott a judge of the Court of Claims, and by President Cleveland he was made chief justice of the same court. This post he held till his retirement in 1905. Besides a work on mechanics' lien laws, and 48 volumes of reports of the court over which he presided, he published *The Mystery of the Pinckney Draught*, New York (1909), *Sketches of the War* (rev. ed., 1911), etc.

NOVAES, GUIOMAR. See MUSIC, Artists, Instrumentalists.

NOVA SCOTIA. One of the Maritime Provinces of the Dominion of Canada: The cap-

ital is Halifax, the chief naval station of Canada. Area, 21,428 square miles, of which 360 water. Between 1901 and 1911 the population increased 7.13 per cent, or from 459,574 to 492,338. In 1911 Halifax had 46,619 inhabitants; Sydney, 17,723; Amherst, 8973; Sydney Mines, 7470; Yarmouth, 6600; New Glasgow, 6383. Of the population 10 years of age and over in 1911, males numbered 193,141 (51.08 per cent) and females 184,989 (48.92); of these, 148,991 males and 24,370 females were reported as employed in gainful occupations. Of the males employed, 31.7 per cent were in agriculture, 14.5 per cent in manufacturing, and 11.5 per cent in mining; of the females, 46 per cent were in domestic and personal service, 18.6 per cent in manufacturing, and 16.7 per cent professional.

The provincial government is administered by a lieutenant-governor, appointed for five years by the Governor-General of the Dominion; he acts through an executive council, or responsible ministry, of eight members. The legislative power is vested in the Legislative Council of 21 members appointed by the crown for life, and the House of Assembly of 38 members elected by direct vote for five years. In the 12th Parliament, which convened in 1911, Nova Scotia was represented by 10 Senators and 18 members of the House of Commons; the representation in the Commons on the basis of the 1911 census is 16. The Lieutenant-Governor in 1916 was David MacKeen.

**NOVATI, FRANCESCO.** An Italian philologist and literary historian, died in 1916. He was born in Cremona in 1859, became professor at Milan in 1883, at Palermo in 1886, at Genoa in 1889, and again at Milan in 1892. With Arturo Gal and Rodolfo Renier he founded the *Giornale storico della letteratura italiana* in 1883; and wrote and edited many articles and volumes on the Middle Ages and Renaissance in Italy. A number of his critical essays are collected in *Studi critici e letterari* (1889). His later publications include: *L'influsso del pensiero latino sopra la civiltà italiana del medio ero* (1897); *Attraverso il medio ero* (1905); *A ricolta* (1907); *Freschi e minii del dugento* (1908); *Storia letteraria d'Italia: le origini* (1900-09).

**NOVELS.** See articles on French, German, Italian, Russian, Scandinavian, and Spanish Literatures; also LITERATURE, ENGLISH AND AMERICAN.

**NOYES, NEWBOLD.** See LITERATURE, ENGLISH AND AMERICAN, *Poetry*, American.

**NUTRITION.** See FOOD AND NUTRITION.

**NUTTALL, ENOS.** An Anglican prelate, died at Kingston, Jamaica, May 31, 1916. He was born in England in 1842, but from the age of 24 he was identified with Kingston, first, for 14 years, as curate of St. George's Church, then, after 1880, as bishop of Jamaica, in charge of the diocese of Honduras, and also, from 1897, as Archbishop of the West Indies. After Kingston had suffered heavily from an earthquake shock in 1907, Archbishop Nuttall went to England and persuaded the British government to give the city £150,000 for rebuilding and relief, and obtained a loan of £800,000 on easy terms. He also did much to smooth over the situation when, at the time of the earthquake, Rear Admiral Davis, U.S.N., offered assistance, and this was declined by Sir Alexander Swettenham, then Governor of Jamaica.

**NYASSALAND PROTECTORATE.** A British protectorate extending from German East Africa to Portuguese East Africa, between Rhodesia and Lake Nyassa, and having an area stated at 39,801 square miles. Population (March 31, 1910), 970,430; 766 Europeans, 481 Asiatics (exclusive of Sikh troops), 969,183 natives. Population estimated, March 31, 1914, 831 Europeans, 410 Asiatics, 1,088,057 natives. The administrative headquarters are at Zomba; the chief town is Blantyre, in the Shiré Highlands. Total imports, 1914-15, £181,387; exports, £182,345; local revenue, 1914-15, £118,523; expenditure, £143,161. There is a railway (113 miles) from Blantyre to Port Herald; its extension to the Zambezi has been undertaken.

**OATS.** The world's oats production in 1916 was below that of the preceding year. The International Institute of Agriculture, Rome, estimated the production of the northern hemisphere at 4,459,735,230 bushels, a figure based to the extent of 62.5 per cent on reports sent in by countries and of 37.5 per cent on the average production for the five years 1909-13 as representing the yield of 1916 in countries not furnishing data. This last class included Germany, Austria, Hungary, Belgium, Bulgaria, Denmark, France, Luxemburg, Sweden, Japan, and Algeria. A third group of countries comprising Greece, Portugal, Turkey in Europe and Asia, Mexico, China, and Persia, for which no recent data exist but whose production is placed at about 41,340,000 bushels, is not included in the above estimate. The production of 1916 of the first and second group of countries represents only 89.8 per cent of that of 1915, but is 3.2 per cent above the five years' average. The 1915-16 harvest of oats in the southern hemisphere was one of the best ever secured, and amounted as estimated to 113,678,110 bushels, but the crop of 1916-17 was reported as not very promising. With the remainder of the preceding year's crop of the northern and southern hemispheres the available supply of oats for the year is placed at 4,968,536,360 bushels as against a requirement of 4,694,735,760 bushels, including 498,050,000 bushels necessary for seed. The average prices for Argentine oats for the six months April to September, 1916, were 28.6 cents and 81.6 cents per bushel in Buenos Aires and London respectively. The corresponding price for oats at Chicago was 45 cents. The ocean freight rates for oats were based on those for wheat, with an additional percentage under certain conditions. Maximum and requisition prices were fixed for oats in Germany, Austria, Hungary, and France, and exportation of the cereal was either prohibited or very much restricted in most European countries, belligerent and neutral.

The oats crop of the United States in 1916 as estimated by the Department of Agriculture amounted to 1,251,992,000 bushels produced on 41,539,000 acres at the average rate of 30.1 bushels per acre. As compared with 1915 the production was smaller by 297,038,000 bushels, and the yield per acre by 7.7 bushels. The acreage was the largest ever recorded. The average farm value on Dec. 1, 1916, was 52.4 cents per bushel as against 36.1 cents on Dec. 1, 1915, and on this basis the total value of the crop was \$656,179,000, which had never been equaled. The value per acre on this same basis was \$15.80. Among the States Iowa ranked first in yield with 186,850,000 bushels, Illinois second

with 172,095,000 bushels, and Minnesota third with 88,112,000 bushels. The acreage in Iowa was 5,050,000, in Illinois, 4,470,000, and in Minnesota, 3,325,000 acres, and the average yields per acre, 37, 38.5, and 26.5 bushels respectively. The highest average yields were secured in the extreme Northwest, where Washington produced at the rate of 52 and Oregon at the rate of 48 bushels per acre. Canada, owing to an unfavorable season, produced only 75 per cent of a normal crop. A number of new and improved varieties of oats were distributed in the United States during the year by the agricultural experiment stations.

**OBERLIN COLLEGE.** A non-sectarian co-educational institution at Oberlin, Ohio, founded in 1833. In the fall of 1916 the total registration of students was 1565, chiefly divided among the College of Art and Sciences, the Graduate School of Theology, and the Conservatory of Music. The officers of the institution numbered 158, of whom 121 were on the teaching staff. During the year the following changes among others were made in the faculty: Clarence Ward, formerly associate professor at Rutgers and lecturer at Princeton, was appointed professor of the history and appreciation of art and director of the Art Museum; John Taylor Shaw, who for 25 years had been principal of the Oberlin Academy, was transferred to the college as associate professor of Latin; Albert Temple Swing, after 23 years of service, retired as professor of church history in the Graduate School of Theology, becoming professor emeritus. He was succeeded by Ian Campbell Hannah. In the conservatory of music Maurice Koessler was appointed professor of violin and ensemble. Miss Frances Juliette Hosford, dean of Academy women and associate professor of Latin, became chairman of the deans of women. President King was given a half year's leave of absence for travel and study, and Azariah Smith Root, librarian and professor of bibliography, received a year's leave to become acting principal of the New York Library School. In 1916 a contract was made for the purchase of property on which to erect the Hall Auditorium, provided for by the will of Charles M. Hall, who had left \$3,000,000 to the college. For this building Cass Gilbert was chosen architect. By the will of Dr. Dudley P. Allen and gift of Mrs. Allen, provision was made for the erection of an Art Building, which was nearing completion at the end of the year, and for a \$100,000 endowment for the teaching of art history. A site for the building was presented by John L. Severance. By will of Dr. Allen also, \$50,000 was given to erect and equip a Hospital Building and \$50,000 for a Nurse Fund. A gift of \$100,000 to the Graduate School of Theology was announced from Mrs. D. Willis James, who died in April, 1916. A like amount had been given by her earlier. From Frederick Norton Finney's estate Oberlin is to receive about \$195,000. On Aug. 31, 1916, the productive funds of the college amounted to \$2,537,012 and the total income for 1915-16 was \$337,143. The library contains 165,000 bound volumes and 142,000 unbound volumes. President, Henry Churchill King.

**OBSERVATORIES, ASTRONOMICAL.** See ASTRONOMY.

**OCCUPATIONAL DISEASES.** The rapid development of workmen's compensation legislation in the United States has been accompanied

during the last few years with the application of the idea that diseases incident to employments should be treated in a manner similar to the treatment of industrial accidents. Detailed studies have been made of the diseases contracted by workers in specified occupations, and an effort has been made to determine the exact causes of these injuries. The result has been that a beginning has been made of the collection of data on the basis of which some form of insurance protection can be provided because the incidents of these diseases and effective measures for their prevention or reduction have been applied. An important aspect of the movement at this stage of its development is the perfection of laws requiring the reporting of all occupational diseases to some centralized State authority, such reporting being required of physicians usually under some legal penalty. The more extensive the investigation becomes the more clearly it is realized that occupational diseases are very widespread and constitute an important aspect of problems of labor, poverty, and poor relief.

**GREAT BRITAIN.** The committee appointed for the study of conditions in British munitions factories reported on various phases of sanitation and health which are important in throwing light on occupational diseases. Industrial fatigue is caused by fatigue in the nervous system with direct and indirect effects, and an important symptom is want of coordination and failure in powers of concentration with an increased frequency of accidents and spoiled work. Hourly rest as well as daily and weekly rest is recommended, especially in the very heavy work of molding. There is also danger for the munitions worker in exposure to lead and nitrous fumes by which serious and possibly fatal illness may be caused. Contact with various chemicals used in metal turning may result in troublesome skin affections. Air free from dust and fumes, good washing facilities, and protection from direct contact are the chief preventive measures in diseases of this kind.

Trinitrotoluol is a highly poisonous substance used in the manufacture of explosives, and it causes illness through escape of nitrous fumes and of chlorine and chlorine compounds, all of which may be absorbed by inhalation, by contact with the skin, and by the alimentary canal. As a result of this absorption, illness may follow from general effects on constituents of the blood or from local effects on the skin. The symptoms are a persistent cough due to no known cause, unaccustomed shortness of breath, fatigue unexplained by exertion, and sudden pains in feet and legs; these may develop quickly. Effective ventilation, proper clothing, sufficient washing facilities, and proper diet are the means recommended for minimizing danger from absorption.

**NEW YORK CITY.** In the fall of 1915 Dr. S. S. Goldwater, at that time commissioner of health of New York, opened a clinic for occupational diseases, Dr. Louis Harris being in direct control. From 150 to 175 persons are examined each day by 17 to 20 physicians. At first food-handlers were examined and the total number of people in occupations of this class who presented themselves for examination in six months' time was 110,000. Then workers in the trades of hatters, hatters' furriers, and furriers were examined. There is no law compelling examination of workers in these trades, as in the food-

handling trades, so the men had to be induced to come voluntarily. This was done by means of trade unions in the organized shops and by inspectors using persuasion with the employer of unorganized shops, and the report shows 113 shops studied and 889 persons examined.

In making fur garments, dust of a very irritating character is breathed in, but it is only mechanically injurious to throat and lungs. But in making felt hats and preparing the fur for felting there is the additional danger of mercurial poisoning. Of 266 men examined who were engaged in preparing fur for felting only 17 were found free from physical defect. Of 81 hatters examined 69 came in contact with mercury and only five were found to be normal. The city plans eventually to use the knowledge thus gained in controlling work done for the city by insisting that all municipal and contract work be done under proper safeguards in order to eliminate as far as possible dangers to health. Then having established a standard for such work the city can proceed to make it compulsory for private industry also.

**EXHIBIT OF THE AMERICAN MUSEUM OF SAFETY.** In January the American Museum of Safety had an exhibit in New York City of models showing the effects of trade diseases. The models used were made of a waxen composition and were colored in such a way as to give realistic effects. They showed chiefly injuries to and evidences of diseases of the hand caused by certain trades. As further educational propaganda, lectures on accident prevention and factory conditions accompanied by moving pictures were given during the luncheon hour.

**ANILINE POISONING.** Luce and Hamilton report the results of a study of aniline poisoning in the United States which is important in view of the great increase in the manufacture of aniline dyes in this country since the German supply has been cut off. It is said that there are already over a dozen factories in operation and that more are likely to be constructed. The manufacture of aniline from coal tar involves exposure to poisons that are new to American sanitarians, although the experience of the Germans and to some extent that of the French and English is well known. Aniline poisoning, in connection with the manufacture of rubber, first came under notice in the tire factories of Akron, Ohio, and was for some time unidentified. A peculiar disease had appeared among the rubber workers, some of whom were at first thought to have cardiac disease and others epilepsy. The malady is now common and well recognized and the victims are known as "blue boys" from the cyanosis which is a prominent symptom. Workers in aniline factories are exposed to a number of highly poisonous volatile compounds. The making of aniline dyes begins with coal tar, which is itself a mixture of benzene, xylene, and other substances, all volatile poisons. The benzene is treated with nitric and sulphuric acids to form nitrobenzene, also a very dangerous poison. The nitrobenzene is in its turn reduced to aniline through the action of iron filings and hydrochloric acid. The action of nitrous acid on aniline and its allied amines produces many of the aniline colors. The workers therefore are exposed to poisoning from benzene, nitrobenzene, and aniline, as well as a host of other allied substances. Methyl alcohol is also used as a reagent. Besides being used for the production of

dyes aniline oil enters extensively into the rubber industry, where it is necessary for the compounding of rubber, and in reclaiming rubber from scrap. Industrial poisoning therefore, which was negligible in this country until very recently, has suddenly assumed decided importance.

The symptoms, common to poisoning by members of the whole aniline group including nitrobenzene and its derivatives, are at first weariness or sleepiness, followed by flushing of the face, a sense of fullness in the head, slight mental confusion, dryness of the throat, and difficulty in swallowing. The color of the face progresses from red to a livid blue, and the pulse is rapid and weak. There are headache, dizziness, nausea, and finally shortness of breath and loss of consciousness. Usually industrial cases of aniline poisoning do not develop the severer symptoms, and the patient seeks advice merely on account of his blue color and the general vasomotor depression; but occasionally epileptoid convulsions are seen, also protracted coma. The chronic cases resulting from repeated doses, usually exhibit headache, disturbance of vision, a sense of exhaustion, muscular twitching, and dizziness. The poison is believed to enter by way of the skin or lungs, or both. Aniline and its derivatives are true blood poisons, the principal action of which is to promote the formation of methemoglobin which replaces oxyhemoglobin. The former substance keeps its oxygen firmly bound, the latter liberates it freely. The condition is therefore one of "internal suffocation," or lack of oxygen in the tissues.

**DOPE POISONING.** A similar form of poisoning is observed in the new industry of making aeroplanes. Five fatal cases have been reported among employees working as tapists, who are engaged in putting on strips of fabric over the seams, after dipping them in "dope" which consists of acetate of cellulose, or celluloid dissolved in tetrachlorethane with amyl alcohol and benzene.

**INDUSTRIAL ACCIDENTS.** Bloedorn has made a study of the accidents occurring among workmen in the United States Navy Yard at Washington, D. C., for a period of two years, beginning Jan. 1, 1914, with a careful analysis of the various factors which entered into their production. The average number of men employed was 3202, and the total number of workmen who suffered from one or more injuries was 2178. The highest percentage of injuries occurred in workmen between the ages of 16 to 20 and decreased steadily until the group between 50 and 59 was reached, when there took place a constant rise with advancing age. Colored employees had a higher rate than white, and single men were injured oftener than married men. New and unskilled workmen had a higher rate than the skilled workmen. One observation contradicts the accepted theory that the proportion of injuries increases with the advancing day, owing to fatigue. The Navy Yard statistics show the greatest percentage of injuries during the first two hours of work. The explanation offered is that this period constitutes the time of adjustment of the workman to his machinery. See **LABOR LEGISLATION**. For occupation as a factor in the causation of disease see also **TUBERCULOSIS**.

**Bibliography.** The year's publications included: G. M. Kober and W. C. Hanson, *Diseases of Occupation and Vocational Hygiene*;

Thomas Oliver, *Occupations from the Social, Hygienic, and Medical Points of View*; R. H. Pearson, *Occupational Diseases*. The United States Public Health Service has issued a series of *Studies in Vocational Diseases*, and special reports were issued by the labor departments of New Jersey and New York; one of the latter was *European Regulations for the Prevention of Occupational Diseases*.

**OCEANIA.** See ANTHROPOLOGY.

**OCEANIC DEPOSITS.** See GEOLOGY, *Oceanic Deposits*.

**O'CONNELL, JOSEPH J.** An American physician and sanitarian, died at the Quarantine Station, Staten Island, N. Y., Jan. 1, 1916. He was born in Brooklyn, N. Y., in 1868, studied at St. Francis College, and in 1887 graduated from the Long Island Medical College. He served as alienist of the Kings County Hospital and for some years had charge of the contagious disease bureau of the Brooklyn Board of Health. Appointed health officer of the port of New York by Governor Dix in 1912, Dr. O'Connell proceeded to institute important reforms. Among these was the construction of the Quarantine Pathological and Bacteriological Laboratory, one of the model institutions of its kind. In 1914, during trouble with typhus in New York harbor, he devised a system of sanitation which was later adopted in some of the European armies in the great war. He wrote on subjects in his special field and lectured at New York University and at the Long Island College Hospital.

**OFFICE BUILDINGS.** See ARCHITECTURE.

**OHIO. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 5,181,220. The population in 1910 was 4,767,121.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16, were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	3,675,000	115,762,000	\$104,186,000
1915	3,700,000	153,550,000	85,988,000
Wheat . . . 1916	1,500,000	20,250,000	34,222,000
1915	1,980,000	40,194,000	41,802,000
Oats . . . . . 1916	1,717,000	48,076,000	25,480,000
1915	1,683,000	69,008,000	24,841,000
Potatoes . . 1916	140,000	6,300,000	11,466,000
1915	153,000	12,546,000	8,782,000
Hay . . . . . 1916	3,100,000	4,867,000	51,590,000
1915	2,812,000	a 4,049,000	51,422,000
Tobacco . . 1916	100,000	95,000,000	12,350,000
1915	93,700	b 84,330,000	7,590,000
Rye . . . . . 1916	75,000	1,088,000	1,306,000
1915	100,000	1,750,000	1,452,000
Barley . . . 1916	83,000	917,000	734,000
1915	30,000	930,000	502,000

a Tons. b Pounds.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments	15,138	15,658
Average number of wage earners	446,934	510,435
Capital invested	\$1,300,733,000	\$1,677,552,000
Wages	245,450,000	318,924,000
The value of materials used	824,202,000	1,020,782,000
The value of products	1,437,936,000	1,782,808,000

**MINERAL PRODUCTION.** There was great progress in the coal industry of the State in 1916. The increased production is estimated by the United States Geological Survey at 65 per cent, or from 22,435,000 tons in 1915 to 37,000,000 tons in 1916. The production in 1913, the banner year for the State, was 36,200,000 tons. In 1914 it was 18,843,000 tons. In January, February, and March, 1916, the production averaged nearly 3,000,000 tons a month. April showed a decrease of nearly half, but after the lake season began the output increased, and in June it had reached the high record for the year, more than 3,500,000 tons. From July to October an almost even rate was obtained, but in November and December there was a slight decrease. About 5,000,000 tons of coal from Ohio were shipped from the lakes, a larger quantity shipped than in any previous year, except 1913. There was a substantial increase in the quantity of coal taken by the railroads for fuel, and the largest factors were greater shipments by the lakes and increased demands from industrial plants, chiefly within the State. During the period of labor troubles in western Pennsylvania coal from Ohio was shipped into the Pittsburgh district to supply the shortage, and in the last quarter of the year Ohio coal was shipped by way of Buffalo to New York and New England. Lack of transportation facilities was not felt in Ohio as in other fields, probably because of the shorter average haul to market.

The production of petroleum in the State in 1915 was 7,825,326 barrels, compared with a production of 8,536,352 barrels in 1914.

**TRANSPORTATION.** The total railway mileage of the State on June 30, 1914, the latest date for which statistics are available, was 9147.

**EDUCATION.** The total school population for 1916 was 1,305,553. The total enrollment in the public schools was 949,470. The average daily attendance was 768,451. There were 23,967 female teachers, and 7852 male teachers. The average annual salary for men teachers in the cities in elementary schools was \$791; in village schools, \$502; in rural schools, \$458. For women in elementary city schools, \$520; in village schools, \$457; and rural schools, \$422. The average salary of men in city high schools was \$988, in village schools, \$792, and \$740 in rural schools. For women in city high schools, \$792; in village high schools, \$634; and in rural high schools, \$608.

**FINANCE.** The total receipts for the fiscal year 1916 amounted to \$19,175,760, and the disbursements to \$19,695,902. There was a balance at the beginning of the year of \$7,390,565, and at the end of the year of \$6,870,423. The chief sources of revenue are from insurance companies, from automobile licenses, and from excise taxes. The State has no bonded debt.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the following: The Athens State Hospital, the Cleveland State Hospital, the Columbus State Hospital, the Dayton State Hospital, the Lima State Hospital, the Longview State Hospital at Cincinnati, the Massillon State Hospital at Massillon, the Toledo State Hospital, the Ohio Hospital for Epileptics at Gallipolis, the Institution for Feeble-Minded at Columbus, the State School for the Blind at Columbus, the State School for the Deaf at Columbus, the Ohio State Sanatorium at Mount Vernon, the Ohio Soldiers' and Sailors'

Home at Sandusky, the Madison Home at Madison, the Boys' Industrial School at Lancaster, the Girls' Industrial School at Delaware, the Ohio Penitentiary at Columbus, the New Prison Farm at London, the Ohio State Reformatory at Mansfield, the Ohio Reformatory for Women at Marysville, and the Ohio State Brick Plant at Junction City. The Ohio Reformatory for Women and the Lima State Hospital were opened in 1916.

**POLITICS AND GOVERNMENT.** There was no session of the Legislature in Ohio in 1916. Late in the year Governor Willis was strongly urged to call a special session to secure legislation permitting Ohio national guardsmen on the Mexican border to vote at the November election, but he refused. Under the Ohio constitution all township and municipal elections occur in the odd-numbered years, while State officials, the Legislature, and all county officials are chosen in the even-numbered years. The presidential primary was held April 25th, but was largely devoid of interest. On the Republican side it was agreed that the State's indorsement for President should go to former United States Senator Theodore E. Burton of Cleveland. The Ohio law requires that the voters of each party shall express a second as well as a first choice for President. Accordingly, Ohio Republicans agreed that Paul Howland of Cleveland, former Congressman, should be their second choice. No nomination was made against either Burton or Howland. On the Democratic side it was agreed with equal unanimity that President Wilson should receive the State's indorsement for reelection. To fulfill the requirements of the law former Gov. James E. Campbell of Cincinnati was made the Democratic second choice for the presidency. The regular State primary was held August 8. Gov. Frank B. Willis had been chosen in April as one of the State's Republican Big Four delegates to the Chicago convention, while former Gov. James M. Cox of Dayton had been similarly honored by the Democrats. The great strength each of these former political opponents showed in this earlier primary clearly indicated his nomination for Governor in August. Governor Willis was renominated by an overwhelming majority. Cox encountered more opposition than Willis, but his nomination was at no time in doubt. For United States Senator the Republicans nominated former Gov. Myron T. Herrick, who had more recently been American ambassador at Paris, his opponents in the primary being former United States Senator Charles Dick of Akron and Harry M. Daugherty of Columbus. The size of Herrick's plurality in the primary was a surprise. Dick's vote was small. On the Democratic side United States Senator Atee Pomerene was conceded renomination, though John J. Lentz entered the race against him. The Republican State platform was adopted in June and the Democratic in August. They differed but little on State issues. A significant feature of each was its promise that the next Legislature should endeavor to give Ohio cities relief from their financial difficulties caused by hampering State legislation. So far as the State campaign was concerned the fight became a comparison between the administration of Willis and that of Cox as Governor, each having served in the office two years, the one in immediate succession to the other. Tax reforms and economy were chief

topics of discussion. Upon no issue were the parties sharply divided. Both candidates spent weeks on the stump. President Wilson and Republican candidate Charles E. Hughes also visited the State during the campaign. Theodore Roosevelt made a series of speeches urging the election of Hughes. Former Progressives appeared generally to be supporting the Republican candidates, national and State. At the November election the entire Democratic State ticket was elected. Democrats won a majority of the Congressional delegation and will control both branches of the Legislature, which meets in January. President Wilson's vote was 604,161, against 514,753 for Hughes, giving Wilson a plurality of 89,408. Cox for Governor polled 568,218, against 561,602 for Willis, giving Cox a plurality of 6616. For United States Senator, Pomerene won over Herrick by a plurality of 35,897, the figures being: Pomerene 571,288, Herrick 535,391. Every elective office at the State capitol will be held by the Democrats after the first of January.

There were labor troubles in the State in the first part of the year and in January riots caused the loss of lives and the destruction of much property at East Youngstown, where 3600 employees of the Republic Iron and Steel Company struck for an increased pay from 19½ cents to 25 cents an hour. The company offered an increase to 22½ cents, but this was rejected, and on January 7th rioting began. A mob of strikers attacked a body of workmen who had not struck, and the throwing of stones was followed by pistol shots, exchanged between the mob and the guards. Several persons were injured. Immediately afterwards they began to set fire to buildings and loot saloons and stores. Before morning ten blocks of buildings, practically the entire business section of East Youngstown, had been destroyed by fire, with a loss of about \$2,000,000. Nearly 100 persons were wounded. After some delay a party of policemen and citizens from the neighboring city of Youngstown dispersed and drove away the rioters. More than 100 were placed in jail. At daybreak on January 8th three regiments of militia arrived and were placed on guard.

**Cleveland.** Three special elections were held in Cleveland during 1916 for the submission of public improvement bond issues to popular vote as required by law. On April 25th an issue of \$2,500,000 was authorized for the erection of a municipal auditorium in the civic group. Most of the site had been acquired before the end of the year. On August 8th a proposed bond issue of \$3,500,000 for street extensions and improvements was defeated. On November 7th issues were authorized as follows: \$3,000,000 for street improvements, \$2,000,000 for new school buildings, \$1,750,000 for extension of the municipal electric light plant. Toward the end of the year an agitation was begun to amend the Cleveland charter so as to provide a city manager form of government. The year 1917 is likely to see this proposal come to an issue at a special election.

**STATE OFFICERS.** Governor, James M. Cox; Lieutenant-Governor, Earl D. Bloom; Secretary of State, William D. Fulton; Treasurer, Chester E. Bryan; Auditor, Vic Douahey; Attorney-General, Joseph McGhee; Board of Agriculture, Renick W. Dunlap—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice,

Hugh L. Nichols; Associate Justices, Thomas A. Jones, Edward S. Matthias, James G. Johnson, Maurice H. Donahue, O. W. Newman, R. M. Wanamaker; Clerk, Frank McKean.

## STATE LEGISLATURE.

	Senate	House	Joint Ballot

Republicans .....	11	56	67
Democratic majority ...	14	16	30

**OHIO STATE UNIVERSITY.** A co-educational State institution at Columbus, Ohio, founded in 1872. In the fall of 1916 the total enrollment was 5761 and the faculty numbered 541. During the year a professional College of Commerce and Journalism was established. The university has productive funds amounting to \$1,009,258, from which it drew an income in 1916 of \$60,555. The total income was \$1,730,975. In the library were 162,000 volumes. President, William Oxley Thompson.

**OHIO UNIVERSITY.** A co-educational State institution at Athens, Ohio. It was founded in 1804. The number of different students in all departments of the university for the year 1916 was 4962. There were 88 members of the faculty. During the year Prof. Henry W. Elson resigned to become president of Thiel College. After he vacated his chair, two independent departments of history and economics were established, C. L. Martzoff being appointed professor of the former subject, and Herbert B. Simpson of the latter. Dr. William Hoover, professor of mathematics, resigned and was succeeded by Robert Lacey Borger. William E. McVey became director of extension work and Miss Mary Tough head of the department of home economics. Prof. Théophile Dambac accepted the chair of Romance languages. The university has in productive funds \$156,504, and in 1916 drew from all sources an income of \$300,533. The library contains 47,000 volumes. President, Alston Ellis.

**OHIO WESLEYAN UNIVERSITY.** A co-educational Methodist Episcopal institution at Delaware, Ohio, founded in 1844. Certain departments of the University are in Cleveland. In all departments in the fall of 1916 there were 1172 students and the faculty numbered 81. During the year Dr. Herbert Welch, the president, was elected bishop of the Methodist Episcopal Church, and Dr. John W. Hoffman was chosen as his successor. The productive funds of the institution amount to \$1,095,000 and the total income from all sources in 1916 was \$159,600. The library contains 70,000 volumes.

**OIL, CRUDE.** See PETROLEUM.

**OIL ENGINES.** See INTERNAL COMBUSTION ENGINES.

**OKLAHOMA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 2,245,968. The population in 1910 was 2,026,534.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16, were as follows:

	Acreage	Prod. Bu.	Value
Corn ..... 1916	3,950,000	58,825,000	\$49,592,000
..... 1915	3,800,000	112,100,000	51,566,000
Wheat .... 1916	8,050,000	29,585,000	49,407,000
..... 1915	8,850,000	38,860,000	34,585,000

	Acreage	Prod. Bu.	Value
Oats ..... 1916	1,160,000	15,080,000	8,596,000
..... 1915	1,350,000	36,450,000	12,758,000
Potatoes .. 1916	84,000	1,802,000	8,514,000
..... 1915	85,000	2,975,000	2,499,000
Hay ..... 1916	550,000	825,000	7,425,000
..... 1915	550,800	a 1,265,000	7,064,000
Cotton .... 1916	2,593,000	885,000	75,882,000

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments ....	2,310	2,518
Average number of wage earners .....	18,143	17,443
Capital invested .....	\$38,878,000	\$65,478,000
Wages .....	7,210,000	11,011,000
The value of materials used ..	34,158,000	70,970,000
The value of products .....	58,682,000	102,006,000

**MINERAL PRODUCTION.** The production of coal in Oklahoma in 1915 amounted to 3,693,580 short tons, valued at \$7,435,906, a decrease of 7 per cent in quantity, and \$768,109, or 9 per cent in value. The number of men employed during the year was 8457, compared with 8078 in 1914.

The lead and zinc production was approximately the same as in 1914. The value of the recoverable lead and zinc in 1915 was \$4,236,636, compared with \$2,019,973 in 1914. The metal content on lead concentrates decreased from 7556 tons in 1914 to 7306 in 1915, but the value increased \$97,376. The recoverable spelter increased from 13,992 tons valued at \$1,427,184 in 1914 to 14,314 tons, valued at \$3,549,872, in 1915.

The production of petroleum in Oklahoma in 1915 far surpassed that of any previous year, and placed the State in the front rank as an oil producer. For the first time since 1908 it surpassed California. There were produced 97,915,243 barrels, valued at \$56,706,133, compared with 73,831,724 barrels, valued at \$57,253,187, in 1914.

The production of coal in the State in 1916 is estimated at 3,470,000 tons, a decrease compared with 1915 of 224,000 tons, or about 6 per cent. The production was curtailed by lack of business during the earlier part of the year at a time when most of the coal fields were producing at a high rate. The demand for coal improved after September 1st, but labor trouble resulted in a temporary shutting down of the mines, and on some of the railroads there was a shortage of cars.

**TRANSPORTATION.** The total railway mileage on June 30, 1916, was 6432. These figures are for main track. There were constructed during the year about 30 miles of new track. Kansas and Oklahoma Southern did a considerable amount of grading during the year. The Ringley and Oil Fields Railroad is being laid on a line from Ringley to Oklahoma City, approximately 120 miles. The railways having the

longest mileage are the St. Louis and San Francisco, 1498; Chicago, Rock Island, and Pacific, 1326; the Atchison, Topeka, and Santa Fe, 992; and the Missouri, Kansas, and Texas, 703.

**EDUCATION.** The total school population of the State in 1916 was 587,134. The total enrollment was 514,401, and the average daily attendance 325,032. There were 3802 male teachers, and 8928 female teachers. The average monthly salary of first grade male teachers was \$84.02, and of female teachers \$63.05; of second grade male teachers \$66.65, and of female teachers \$58; of third grade male teachers, \$57.24, and of female teachers \$50.12.

**FINANCE.** The total receipts from all sources in 1916 amounted to \$6,261,511. The total disbursements amounted to \$5,393,927. The balance on hand at the beginning of the fiscal year July 1, 1915, was \$1,055,196, and at the close of June 30, 1916, the balance was \$1,922,780. The bonded debt of the State was \$4,367,000. The chief source of revenue aside from ad valorem taxes is the gross production tax on oil. The chief expenditures are for the support and maintenance of the educational institutions.

**CHARITIES AND CORRECTIONS.** The State penal and charitable institutions include the Oklahoma State Orphans' Home at Pryor, the Confederate Soldiers' Home at Ardmore, Hospitals for the Insane at Vinita, Supply, and Norman, School for the Blind at Muskogee, Institute for Feeble-Minded at Enid, State Training School for Boys at Pauls Valley, School for Deaf and Dumb at Sulphur, Industrial School for Girls at Chickasha, Industrial School for Deaf, Blind, and Colored Orphans at Taft, Training School for Negro Boys at McAlester, School for Wayward Incurable Girls at Oklahoma City, State Penitentiary at McAlester, and State Reformatory at Granite. The total expenditure for the maintenance of these institutions is about \$1,000,000 per year.

**POLITICS AND GOVERNMENT.** There were no elections for State officers, and interest in the election of November centred about the presidential campaign. Oklahoma is strongly Democratic, and there was no question as to the Democrats being able to carry the State. President Wilson received 148,626 votes, and Mr. Hughes 98,299. The Socialist candidate received an unusually large vote, 45,431. The Democrats had a substantial majority in both houses of the Legislature.

In September the attorney-general of the State filed a complaint against every refining company and oil corporation in the State. He declared that the advance from 17 cents a gallon for gasoline to 25 cents in September was in accordance with an "understanding," and therefore a violation of the Federal law.

**LEGISLATION.** The State Legislature met in special session during the year. Several measures of importance were passed. A constitutional amendment authorizing counties to abolish or resume the township form of government was adopted. The Legislature adopted a joint resolution proposing a new constitutional amendment, changing the description of persons excepted from the literacy test to those who have seen military or naval service, including service in any foreign nation, and their descendants. This action was due to the fact that the Supreme Court in 1915 pronounced unconstitutional the section of the State constitution known as the

grandfather clause, which in effect prevented the negroes of the State from voting. Provision was made for absentee voting in the State. The initiative and referendum relating to the distribution of publicity pamphlets was amended.

**STATE OFFICERS.** Governor, R. L. Williams; Lieutenant-Governor, M. E. Trapp; Secretary of State, J. L. Lyon; Treasurer, W. L. Alexander; Auditor, E. B. Howard; Adjutant-General, F. M. Canton; Attorney-General, S. P. Freeling; Commissioner of Insurance, A. L. Welch; Commission of Education, R. H. Wilson; Commissioner of Agriculture, F. M. Gault—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Matthew J. Kane; Associate Justices, John B. Turner, J. F. Sharp, Summers Hardy, and Charles M. Thacker; Clerk of the Court, William M. Franklin.

#### STATE LEGISLATURE.

**OKLAHOMA, UNIVERSITY OF.** A non-sectarian co-educational institution at Norman, Okla., founded in 1892. In 1916 there were 2500 students and 147 faculty members. From all sources the university drew an income of \$253,500. The library contains 24,500 volumes. President, Stratton Duluth Brooks.

**OLD-AGE PENSIONS.** During the past few years there have been various attempts made by persons interested in social and labor legislation to promote the establishment in the United States of old-age pension schemes by civil authorities and also by private corporations. Every advanced country in the world except this country has enacted some form of public old-age pension scheme whereby members of the working classes upon arrival at age 65 or 70 may retire with an assured pension sufficient to obviate the necessity of public relief. Such pensions are usually provided from funds to which the beneficiary makes a contribution along with his employer and the state; in England they are provided entirely from the public treasury. In the United States most of the civil authorities have made provision for the retirement of their own employees, but thus far provision for the old-age incapacities of industrial employees has been made only here and there by the larger corporations. Corporation retirement systems, however, have now become numerous, including as they do every railway system of importance, and the great banking, telephone, telegraph, manufacturing, and commercial firms. The most serious defect, however, with the American plan of leaving the establishment of old-age pensions to private initiative is that the vast majority of the lowest paid workers who are most liable to require public assistance in old age are not included. It is for this reason primarily that social workers and insurance enthusiasts maintain that a universal compulsory system provided by public authority is the only proper solution. Moreover, the predominant opinion in this country has been that such a system should require contributions from the bene-

ficiaries and from employers to be supplemented and administered by the State.

**CONGRESSIONAL ACTION.** During the last session of Congress a group of social workers and insurance experts appeared before the House Committee on Labor in favor of Federal old-age pensions. Dr. Royal Meeker, chief of the United States Bureau of Labor Statistics, pointed out that even Turkey is ahead of the United States in this field of legislation. Miles M. Dawson, a well-known insurance expert, testified that since adopting sickness insurance and old-age pensions, Germany has added 12 years to the average life of her working population. State Insurance Commissioner Potts of Illinois declared that the "insurance monopoly" was fighting the creation of government insurance funds. Various others, including Dr. I. M. Rubinow of New York, J. P. Chamberlain of Columbia University, and Insurance Superintendent Nesbit of the District of Columbia, testified that the present means of dealing with sickness, unemployment, and old-age disability in this country were totally inadequate to the need.

**OHIO.** An Ohio Old-Age Pension League was formed during the summer at Columbus to launch a movement for securing old-age pensions in the State. All sections of the State sent representatives to the organization of the league. The conference decided to initiate a bill with the following main features: an age limit of 65 years; persons with an income of less than \$240 a year from other sources to be eligible; property holdings to the amount of \$1500 to be exempted in computing income; 5 per cent per annum of the value of real estate in excess of \$1500 to be regarded as income; inmates of public institutions to be ineligible; juvenile or probate courts to have charge of the administration; inheritance taxes to be the chief source of the revenues; and the maximum annual pension to be \$240. As Ohio has the indirect initiative the bill will have to be presented to the State Legislature accompanied by signatures of 3 per cent of the voters. Then in case the Legislature does not act upon it or rejects it, the bill will be placed upon the ballot at the next general election providing 3 per cent of the electors petition again. The league plans to present the bill at the meeting of the Legislature in January, 1917.

**PROTESTANT EPISCOPAL CHURCH FUND.** On March 1st a committee of this church headed by Bishop William Lawrence of Massachusetts began a campaign for \$5,000,000 as basis for a retirement fund for Protestant Episcopal ministers. Late in December it was announced that \$4,000,000 had been raised and that the fund would be completed by March 1, 1917. It will be used primarily to give pensions to ministers voluntarily retiring at age 68. The pension in each case will equal  $1\frac{1}{4}$  per cent of the average salary received during past years of service multiplied by the number of years service, but in no case less than \$600 nor more than one-half the average salary. In addition the fund will supply a basis for disability pensions ranging from \$600 to 40 per cent of the average salary during the last five years preceding disability; widows' pensions ranging from a minimum of \$300 to one-half the husband's pension; and orphans' benefits. These latter will be as follows: orphans under age 7, \$100 per year; those 7 to 14, \$200; those 14 to 21, \$300.

**WELLS FARGO PLAN.** On June 1, 1916, a pension system affecting more than 15,000 employees was announced by the Wells Fargo Company. The plan provides for contingencies ranging from sudden death to disability and old age, and was formed because the pre-existing pension system was found to be inadequate to meet the needs of modern life. The clause touching old-age pensions provides that an employee who has been 40 years in the service and is 60 years of age may retire at his own request and be pensioned. Also if an employee be 70 years of age and has had 25 years of service he may receive a pension. After being 25 years in the service if he be incapacitated for further work he receives a pension regardless of age. The amount of pension is based on pay received at the time of retirement and no employee may receive less than \$30 or more than \$125 a month. Also a pensioned employee will not be debarred from engaging in other occupations not prejudicial to the company.

**GREAT BRITAIN.** The government decided August 30th to make an additional allowance not exceeding half a crown per week to special cases of old-age pensioners. In doing this the government responded to prolonged agitation concerning the hardships suffered by old-age pensioners because of an increase in the price of necessities.

**GERMANY.** A resolution favoring the reduction of the age limit in the case of old-age pensions was unanimously adopted by the Reichstag January 15th. The resolution provided that the age limit be reduced from 70 to 65 years.

**HOLLAND.** At the opening of the Dutch Parliament in April, a motion was made by one of the deputies to strike the old-age pensions bill from the governmental programme on the plea that it was of a controversial nature and thus militated against the unity which was so necessary because of the danger threatening its warring neighbors. But leading statesmen having shown that conditions were not such as to necessitate the discontinuance of the bill the motion was rejected by a good majority.

**REFERENCES.** Aspects of old-age pensions are treated in the following publications of 1916: J. A. Hensey, *Poverty and Preaching* (refers to superannuation of ministers); H. J. Hoore, *Old-age Pensions; Their Actual Working and Ascertained Results in the United Kingdom* (1915); National Civic Federation, *The Problem of Pensions; Federal, State, Municipal, and Industrial*. **OLDHAM, WILLIAM F.** See **METHODIST EPISCOPAL CHURCH.**

**OMAN.** An independent Mohammedan state in southeastern Arabia under a sultan, subsidized by the Indian government, which retains a political agent at his court. Estimated area, 82,000 square miles; estimated population, 500,000. The capital is Muscat; its population, including that of the adjacent Muttra, is about 25,000. Imports in 1914-15, 4,914,177 rupees, and exports, 4,124,093 rupees; in 1913-14, 6,116,520 rupees and 4,073,044 rupees. These figures are only for sea-borne trade; in addition, there is a large unrecorded caravan trade with the interior. Reigning sultan, Seyyid Timar bin Faisal, who was born in 1886 and succeeded his father, Seyyid Faisal bin Turki, on Oct. 5, 1913.

**ONE DIMENSIONAL GAS.** See **PHYSICS.**

**ONTARIO.** The second largest province of the Dominion of Canada, extending from Quebec westward to Manitoba. The capital is Toronto. Area, 407,262 square miles, of which 41,382 water. This area includes that portion of the Northwest Territories annexed to Ontario in 1912. Previously the area of the province was 260,862 square miles; between 1901 and 1911 the population of this area increased 15.58 per cent, or from 2,182,947 to 2,523,274. In 1911 Toronto had 376,538 inhabitants, being the largest city after Montreal in Canada; Ottawa, capital of the Dominion, 87,062; London, 46,300; Brantford, 23,132; Kingston, 18,874; Peterborough, 18,360; Windsor, 17,829; Fort William, 16,499; Berlin, 15,196; Guelph, 15,175; St. Thomas, 14,054; Stratford, 12,946; Owen Sound, 12,558; St. Catharines, 12,484; Port Arthur, 11,220; Sault Ste. Marie, 10,984; Chatham, 10,770; Galt, 10,290. Of the population 10 years of age and over in 1911, males numbered 1,043,188 (51.75 per cent) and females 974,632 (48.25); of these, 836,135 males and 154,878 females were reported as employed in gainful occupations. Of the males employed, 36 per cent were in agriculture, 22 per cent in manufacturing, 10.8 per cent in trade and merchandising, and 10 per cent in building trades; of the females, 33.8 per cent were in personal and domestic service, 30.7 per cent in manufacturing, 14.5 professional, and 13.8 in trade and merchandising.

The provincial government is administered by a lieutenant-governor, appointed for five years by the Governor-General of the Dominion; he acts through an executive council, or responsible ministry, of 10 members. The legislative assembly is unicameral and consists of 111 members elected by manhood suffrage for four years. In the twelfth Parliament, which convened in 1911, Ontario was represented by 24 Senators and 86 members of the House of Commons; the representation in the Commons on the basis of the 1911 census is 82. The Lieutenant-Governor in 1916 was Col. Sir John Strathearn Hendrie, appointed Sept. 26, 1914, in succession to Col. Sir John Morison Gibson.

1915	130,000	4,680,000	2,902,000

a Tons.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments . . .	2,246	2,320
Average number of wage earners . . . . .	28,750	28,829
Capital invested . . . . .	\$89,082,000	\$189,500,000
Wages . . . . .	19,902,000	20,981,000
The value of materials used . .	50,552,000	68,258,000
Thee value of products . . . . .	93,005,000	109,762,000

**MINERAL PRODUCTION.** The total output of gold in the State in 1915 was valued at \$1,861,796, compared with a value of \$1,591,461 in 1914. The silver production was 117,947 ounces valued at \$59,799, a decrease of 24,605 ounces in quantity. The copper output in 1915 was 451,172 pounds, compared with 39,248 pounds in 1914. There were produced in 1915 62,957 pounds of lead, compared with 16,436 pounds in 1914.

The preliminary estimates of the value of the metals mined in the State in 1916 showed an increase over 1915 for gold, silver, and copper and a decrease for lead. The output of gold in 1915 was \$1,861,796, and for 1916 \$1,900,000. The output of silver in 1915 was 117,947 ounces, and in 1916 227,500 ounces. The copper output of 1915 was 451,172 pounds, and in 1916 2,527,000 pounds, or an increase of 2,075,828 pounds. The lead output was 62,957 in 1915, compared with 22,000 pounds in 1916.

The output of gold in the State in 1916 was about the same as in 1915. There was a revival of activity in the hydraulic mining industry of the State, particularly in the counties along the northwestern border. Many old properties were reopened, and many new ones were put in condition for working.

**TRANSPORTATION.** The total mileage of main lines in the State on June 30, 1916, was 2860. The roads having the longest mileage are the Oregon-Washington Railroad and Navigation Company, 967; the Oregon and California, 680; the Southern Pacific, 356. The Southern Pacific in 1916 constructed 118 miles from Eugene to North Bend, the Oregon-Washington Railroad and Navigation Company, 33 miles from River-side to Crane.

**EDUCATION.** The total school population of the State in 1916 was 209,028. The total enrollment in the public schools was 142,365, with an average daily attendance of 127,692. There were 6173 teachers, of whom 1207 were male, and 4966 female. The average monthly salary of male teachers was \$87.14, and of female \$63.61. During the past year the most important work in education has been the standardizing of the high schools of the State. In 1915 the superintendent of public instruction appointed a committee of high school principals to determine what should be required of a high school in order that its courses might be considered standard. After sev-

eral months of investigation the committee filed a report which is used as a basis for standardization. At the opening of the school year 1915-16 there were 167 four-year standard high schools in the State. Throughout the year school districts have been working steadily to have their schools placed on the official list. There will be 180 schools meeting all the requirements.

**FINANCE.** The receipts for the two years ending Sept. 30, 1916, amounted to \$12,044,354, and the disbursements to \$11,473,469. There was cash on hand on Oct. 1, 1914, of \$567,917, and on Sept. 30, 1916, of \$1,138,802. There is no State debt.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Oregon State Hospital at Salem, the Eastern Oregon State Hospital at Pendleton, the Oregon State Penitentiary at Salem, Institute for the Feeble-Minded, Oregon State Training School, Oregon State Tuberculosis Hospital, the Oregon State School for the Blind, Oregon State School for the Deaf, the Oregon State Industrial School for Girls, all at Salem, and the Oregon State Soldiers' Home at Roseburg.

**POLITICS AND GOVERNMENT.** A novel phase of the Oregon presidential primary law attracted wide attention prior to the primary election May 19th. Taking advantage of the provision for placing the names of candidates upon the ballot by petition, a petition proposing Charles E. Hughes, then Associate Justice of the Supreme Court, for President, was circulated without his consent or authority. In response to a protest from Mr. Hughes, the Secretary of State refused to heed the petition. The petitioners appealed to the courts and a ruling was obtained to the effect that a person's name may be placed upon the ballot by petition in spite of his objections. Consequently Mr. Hughes was formally a candidate for Republican presidential preference. Theodore E. Burton and Albert B. Cummins were avowed candidates. The party vote gave Mr. Hughes 58,764, Mr. Cummins 27,558, and Mr. Burton 10,593. This result pledged the Oregon delegation to the Republican National Convention, also chosen by the primary method, to Mr. Hughes. William Grant Webster, of Illinois, was the only person whose name appeared on the Republican ballot as a candidate for the vice-presidential nomination. He received 58,076 votes. There was no contest on the Democratic presidential ticket, the name of President Wilson appearing alone. Under the Oregon system no conventions to adopt platforms or nominate candidates are held. In the general election the State's electoral vote was given to Mr. Hughes by the following vote: Hughes, 126,969; Wilson, 120,125; Hanly, 4755; Benson, 9767.

Contests for other offices, except in two congressional districts, were largely perfunctory. The only State offices filled were those of secretary of State, dairy and food commissioner, two supreme judges, and two district public service commissioners. Republicans were elected. In the first congressional district W. C. Hawley was reelected, defeating Mark Weatherford, who had the Democratic and Prohibition endorsements. In the second district, N. J. Sinnott, incumbent, was opposed only by a Socialist candidate who received substantially his party vote. In the third district C. N. McArthur was reelected, defeating John J. Jeffrey,

Democrat, and A. W. Lafferty, Independent.

In 1916 Oregon women participated in their first presidential election. This contributed to increase the total vote of 137,040, cast in 1912, to 261,616. A slight diminishing influence on the total vote was caused by adoption in 1914 of an amendment making full citizenship a necessary qualification of voters. Previously aliens who had declared their intention to become citizens were qualified.

Eleven constitutional amendments and bills were submitted to the electorate. By a majority of 5252 importation of intoxicants for beverage purposes was prohibited. This constitutional amendment is supplementary to a previously adopted amendment prohibiting sale or manufacture within the State except for medicinal, scientific, or sacramental purposes. Under the statute passed to support the earlier amendment importation in limited quantities had been permitted for use in homes. Other measures adopted were the following: an amendment establishing a State rural credit system based on State bonds; an amendment empowering the Governor to veto single items in appropriation bills; an amendment exempting home-owned or home-registered ships from local taxation; an amendment limiting tax revenues levied in any one year to an amount not more than 6 per cent in excess of the total levied in the preceding year, and a bill repealing a Sunday "blue law." The voters defeated a bill to permit manufacture of malt liquors containing 4 per cent alcohol, a bill prohibiting compulsory vaccination, an amendment which combined full single tax with a home-owners' loan fund system, a bill establishing a second normal school, and an amendment designed to remove an inoperative section from the constitution denying the suffrage to negroes, mulattoes, and Chinese. Charges of fraud in circulation of initiative petitions incident to other elections recurred. A grand jury investigation failed to produce indictments but disclosed that the petitions which initiated the single tax proposal carried names of many persons whose addressee were illegible, names of others who could not be found, and that one sheet bore evidence of having been circulated among the prisoners in the county jail. There was no session of the Legislature in 1916.

**OTHER EVENTS.** The Sunday closing law enacted in 1864 was upheld by the United States District Court of Portland, Ore., in January. The law has for many years been regarded as obsolete, but recently the Portland Retail Grocers' Association upon learning of its existence, became active in its enforcement. Several grocers who kept their stores open on Sunday were arrested and some of them were fined. Under the law the only places allowed to do business on Sundays are undertaking establishments, bakeries, and hotels. On June 7th was celebrated the dedication of Columbia River highway, which is declared by experts in road engineering one of the greatest highways ever built to meet the condition of modern traffic. The scenic attractions along this road are not surpassed by any highway in the world.

**STATE OFFICERS.** Governor, James Withycombe; Secretary of State,\*\* Benjamin W. Olcott; State Treasurer, Thomas B. Fay; Superintendent of Public Instruction, J. A.

Churchill; Attorney-General, George M. Brown; Dairy and Food Commissioner,\*\* John D. Mickle; Labor Commissioner, O. P. Hoff; Adjutant-General, George A. White; Insurance Commissioner, Harvey Wells; State Engineer, John H. Lewis; Corporation Commissioner, Henry J. Schulderman; Public Service Commission, Thomas K. Campbell, \* Fred G. Buchtel, and \* H. H. Corey. All are Republicans.

JUDICIARY. Supreme Court: \*\* Frank A. Moore, Thomas A. McBride, Henry J. Bean, \*\* George H. Burnett, Robert Eakin, Henry L. Benson, Lawrence T. Harris; Clerk, J. C. Moreland—all Republicans.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Republicans .....	24	55	79
Democrats .....	5	4	9
Independents .....	1	1	2
Republican majority . . .	18	50	68

**OREGON, UNIVERSITY OF.** A co-educational State institution at Eugene, Ore. The School of Medicine is in Portland. The total enrollment in all departments in the fall of 1916 was 1579. The faculty numbered 128. The university has \$55,000 in productive funds which yielded \$4400 in 1916, but its principal income was \$270,000 from a millage tax. A land fund yielded \$6000. In the library are 68,000 volumes. President, Prince Lucian Campbell.

**ORNITHOLOGY.** The National Association of Audubon Societies continued its work for the spread of interest in birds, and legislation for their protection. About \$100,000 of income was spent by the society in 1915. Under the auspices of the New York Zoölogical Society, Beebe established at Demerara a tropical station for the study of bird evolution and the life histories of important species. The importance of the cat problem to bird lovers is emphasized by Forbush in a bulletin of the Massachusetts State Board of Agriculture, who pointed out the damage done to birds by cats which are allowed to run loose. Forbush insists that traps are more efficient than cats in exterminating rats and mice, and that cats should be licensed and kept under control just as dogs are.

An important agreement relating to bird protection was made between the United States and Canada and ratified by the United States Senate in August of 1916. This provides for the protection of insect feeding and game birds flying from the United States into Canada. In connection with the supposed benefits conferred by insect feeding birds on agriculture, it is interesting to note that this is regarded as much less important by entomologists than by ornithologists, the former holding that since birds do not discriminate between insects, they may, by eating forms that normally parasitize other insects, do more harm than good. See **ZOOLOGY**.

**OSBORN, HENRY FAIRFIELD.** See **GEOLOGY**.  
**OSBORNE, THOMAS MOTT.** See **PENOLOGY**.  
**O'SHAUGHNESSY, EDITH.** See **LITERATURE, ENGLISH AND AMERICAN, History, etc., American**.

**OTT, ISAAC.** An American neurologist, died

\* Elected 1916.

\*\* Relected 1916.

at Easton, Pa., Jan. 1, 1916. Born in Northampton County, Pa., in 1847, he spent three years at Lafayette College, graduated in medicine from the University of Pennsylvania in 1869, and later studied at Leipzig and Berlin. Afterward he practiced at Easton and in 1878 was appointed lecturer on physiology at the University of Pennsylvania. From 1894 he was connected with the Medico-Chirurgical College of Philadelphia as professor, and in 1895-96 as dean also. At one time he was president of the American Neurological Society. Among Dr. Ott's writings are: *Modern Antipyretics* (1892); *Contributions to the Physiology and Pathology of the Nervous System* (20 parts); *Text-Book of Physiology* (1904); *Internal Secretions* (1910); *Fever* (1914).

**OTTO,** former king of Bavaria, died at Fürstenried Castle, near Munich, Oct. 10, 1916. He was born April 27, 1848, and after his early education was completed, prepared for the life of a soldier. In the Franco-Prussian War he was attached to the staff of the Crown Prince of Prussia, but symptoms of insanity developed and he was recalled to Munich. He grew steadily worse, and in 1876 he was put under restraint in the Castle of Nymphenburg, being put under still more rigorous restraint two years later. On the suicide of his insane brother, Ludwig II, in 1886, Otto nominally succeeded to the throne, but the government was in the hands of his uncle, the Regent Luitpold. Under the regency Otto was removed to Fürstenried castle, where he was kept in confinement until his death. He was formally deposed on Nov. 5, 1913, and was succeeded by the regent, now Ludwig III. Like his brother Ludwig II, he was passionately fond of music.

**OUIZERO-ZEODITU.** See **ZEODITU, OUIZERO**.

**PACHMANN, VLADIMIR.** See **MUSIC, England**.

**PAGE, CARROLL SMALLEY.** Relected Republican United States Senator from Vermont, Nov. 7, 1916.

**PAGEANTS.** See **CELEBRATIONS; DRAMA; MUSIC; RUTGERS COLLEGE; YALE UNIVERSITY**.

**PAHANG.** A state of the Federated Malay States (q. v.).

**PAIN, BARRY.** See **LITERATURE, ENGLISH AND AMERICAN, Fiction, English**.

**PAINE, CHARLES JACKSON.** An American soldier and yachtsman, died at his summer home at Weston, Mass., Sept. 9, 1916. Born in Boston in 1833, he graduated from Harvard at 20, and three years later was admitted to the bar. In the fall of 1861 he became a captain of Massachusetts volunteers, and rose to be a colonel, resigning in 1864. For his services at the capture of Fort Fisher, having again entered the service as brigadier-general, he was brevetted major-general. After the war it was as a yachtsman that General Paine became internationally known. In 1884 he had the *Puritan* built to defend the *America's* cup against Sir Richard Sutton with his *Genesta*. In 1885 the *Mayflower* was built to meet the challenge of the *Galatea*, and later the *Volunteer* defeated the *Thistle*. All these American yachts which had been sailed with such success were built by Edward Burgess, but General Paine was largely responsible for the designs. After Mr. Burgess's death, General Paine entered the *Jubilant*, designed by his son, after the *Thistle II*

had challenged, but it was eliminated in the contest among several competitors for the place of defender. General Paine acquired important railway interests in the West, and in 1897 was one of three envoys sent abroad to further the cause of international bimetalism.

**PAINTING AND SCULPTURE.** The artistic events of the year 1916 showed a state of affairs which has never before existed. As a result of the great European war the centre of artistic activities, both productive and commercial, changed from Europe to New York. The lack of artists' work from abroad caused unusual emphasis to be placed upon native work. Beyond this, no perceptible effect of the war upon art was visible. A distaste for martial subjects in art may be the ultimate result, for those who have experienced the hardships and horrors of modern warfare will hardly be eager to find inspiration in it. But a deeper spiritual and moral awakening, making itself felt in the more serious and devoted attitude to the highest ideals in art, should be the natural outcome.

The increasing prevalence of exhibitions of the work of a single artist and the constant expansion of the judicious "group-system" in exhibiting were interesting features of art shows of a non-official nature. Although the Cubists and Futurists were not as much in evidence as in previous years, the ultra-modern movement was viewed in an exhibition of the Vorticists in a New York club. On the other hand, exhibitions of works by the followers of the post-impressionist movement were frequent, and found earnest interpreters and appreciative patrons. An increasing interest on the part of the general public in works of art, contemporary and old masters, and an eagerness to visit the exhibitions in museums and in the constantly-increasing number of small, compact, well-appointed galleries, was observable.

The necrology list for the year included, among others, in America, William M. Chase, long a prominent and influential artist, the landscape painters, William Ranger and W. G. Bunce, the portraitists, Charles N. Flagg and Thomas Eakins, and the talented sculptor, Edith Woodman Burroughs; in France, the veteran landscape painter, Harpignies, the gifted mystic, Odilon Redon, and the sculptor Mercié. See separate articles on all these artists except Bunce, for whom see **NECROLOGY**.

**ARCHITECTURAL LEAGUE EXHIBIT.** This exhibition, held in January, presented an unusually ingratiating appearance in 1916, owing to the garden-like effect of the decorations of the Academy rooms, with gravel paths, softly plashing water, and blue cloth sky. In the Academy room were placed the exhibits of the American school in Rome, including the result of the collaborative competition, won by John Gregory, Kenneth Carpenter, and Eugene Savage. Interesting were the reconstructed plans of the vatican palace, after Bramante's original designs, by Kenneth Carpenter and a fresco revival in the panel by Eugene Savage.

In the south gallery were exhibited the decorative studies by Violet Oakley for the Governor's room at the capitol, Harrisburg, and her projected "Dante" window. Other effective studies for proposed decorations were exhibited by Robert K. Ryland, Hugo Ballin, and W. H. Henderson. Exotic color studies of tropical seas by Stephen Haweis and Robert Chanler, and a lively

frieze of dancing figures by W. T. Benda lent color to the walls. Dainty and sprightly in movement was the panel contributed by T. G. Sommers, while the large "Noon" by Arthur Crisp showed both breadth of space composition and lightness of touch. Nor should Mrs. Magonigle's intricately patterned panel designs, especially "The Falconess," be overlooked.

**PENNSYLVANIA ACADEMY EXHIBIT.** The one hundred and eleventh exhibition at Philadelphia upheld in every respect its usual high standard, and a number of paintings by artists lately returned from abroad helped to add a new note to the carefully arranged walls. In all, 439 paintings and 217 pieces of sculpture were on view. Joseph T. Pearson received the Temple gold medal and the Stotesbury prize for the decorative "In the Valley," a study of wild geese; Emil Carlsen, the Jennie Seanan gold medal for the carefully wrought "Entrance to St. John's Harbour." The portrait of Dr. Felix Adler by Douglas Volk, belonging to the Metropolitan Museum, received the Carol Beck medal. Karl Anderson's highly personal canvas, "The Heirloom," and "In Provincetown" by Nancy Smith also received prizes. The G. D. Widener sculpture prize went to Edward McCarten for the charmingly imaginative "Spirit of the Woods." Marie D. Page's "The Mother" offered an interesting contrast in the austere treatment of the mother's face and the soft, downy head and indefinite features of the nestling infant. Two early interesting pictures by John S. Sargent and Mary Cassatt were noteworthy. "Sunlight and Shadow," a 20-year-old canvas by the late W. M. Chase, in its quiet reticence and sound technique more than held its own, though juxtaposed with the energetic and sparkling marines of Carol Tyson. Among the many interesting portraits, special mention should be made of that of Hervey White by Eugene Speicher; Leopold Seyffert's strong "Hans Kindler," and Alexander Drake, by John Johansen. A group of pictures by J. Alden Weir showed at his best this mellow and finished artist, while Hugh H. Breckenridge's "Nude" gave an almost metallic impression. The usual number of pleasing landscapes by artists of established reputations were not missing.

**NATIONAL ACADEMY, SPRING EXHIBITION.** The efforts of the new administration bore fruit of an agreeable character in the distribution and hanging of the paintings of the spring exhibition of the National Academy of Design 513 in all, of which 143 were miniatures. The pleasing lack of the usual overcrowding, and the absence of surplus portraiture gave the spectator more opportunity to enjoy the really fine examples exhibited. Such a one was J. Alden Weir's young woman entitled "A Disciple of Grolier," treated with sensitive reserve and delicacy. The two compositions of young women by Ivan Olinisky displayed fine personal feeling and balanced workmanship. Louis Bett's vigorous portrait of Ben Foster, and the dashing "Miss Bonnie Glass," a study in white by Ben Ali Haggin, deserved special notice. William T. Smedley's prize-winning portrait of "Miss C. B. R." showed progress in the mastery of warm, rather thick color. The collection of landscapes was of the usual aspect, with perhaps a leaven of the new movement perceptible. The luminous and finely balanced "Moonlight," a marine by Emil Carlsen, received the Saltus medal. The first

Altman prize and the Inness gold medal went to Charles Rosen for his "Winter Sunlight," an expressive and careful work. Ernest Lawson's two contributions showed the rich and delicate color and individual interpretation of this talented artist, who received the second Altman prize for the "Pigeon Coop." The arresting figure piece, "The Peacock Girl," by E. F. Church, received the Thomas B. Clarke prize, and a highly decorative composition, "The Strollers," brought the first Hallgarten prize to Arthur Crisp. The unassuming "Interior of a Wood" by John Carlsen possessed fine color and breadth of treatment, and the small and unobtrusive little canvases, easily overlooked, but rich in content, offered by Walter Goltz, Jerome Myers, and Eugene Higgins, should not be forgotten. The contribution of F. Luis Mora, a huge "Fantasy of Goya," while displaying an ambitious imagination, brought its author slightly beyond his depth. The usual expected and firm foundation of all academic exhibitions was there in characteristic pieces by Bruce Crane, J. Francis Murphy, Walter Palmer, Ben Foster, C. H. Davis, Carleton Wiggins, and Leonard Ochtman. The carefully composed and intellectually conceived work of Kenyon Cox and Sargent Kendall, and the academic but richly colorful creations of Hugo Ballin, acted as ballast to hold down the more flighty outpourings of the youthful exhibitors. Their impetuous strivings, on the other hand, contrasted refreshingly with the carefully carried out, seldom-varied color recipes of such men as Gardner Symons, Elmer Schofield, Edward Redfield, and others.

**PITTSBURGH EXHIBIT.** The international exhibition at the Carnegie Institute, Pittsburgh, omitted last year because of the Panama-Pacific Exposition, was in 1916 devoted entirely to the works of foreign artists, brought directly from San Francisco. They have been noted in connection with the Exposition in the *NEW INTERNATIONAL YEAR BOOK OF 1915* (q.v.). The paintings of the Swedish section were afterwards on view at the Brooklyn Institute and other museums, and exhibitions of some of the French and English works were held in New York galleries.

**CORCORAN ART GALLERY EXHIBIT.** Two noteworthy features stood out in viewing the sixth exhibition by contemporary American artists at the Corcoran Art Gallery, Washington, which opened December 17th. The first was that the invited list included names of the exponents of advanced modernist ideas. The paintings of Samuel Halpert, Henry McFee, and Andrew Dasburgh formed an interesting group among works of the expected character. The other feature of interest was the inclusion among the awards of artists in the advance guard of the younger school. Arthur Davies carried off the first W. A. Clark prize and Corcoran gold medal with his fine and stimulating canvas "Castalías"; the other prizes went to Ernest Lawson, Hugh Breckenridge, and George Luks. Two canvases by William Glackens well portrayed that artist's subtle mastery of glowing color, and Allen Tucker's broad, embracing treatment of nature was well exemplified in his "Albany Intervale." Other paintings which harmonized with these in freshness of endeavor and execution were by Leon Kroll, Rockwell Kent, John Sloan, and Eric Hudson.

Several important portraits and other works

by John Singer Sargent were collected in a small special room. In others hung representative examples by the late W. A. Chase, Cecilia Beaux, Douglas Volk, Lydia Emmet, and George Bellows, besides graceful and distinguished study portraits by J. Alden Weir and Frank Benson. Other artists, whose works, quite in their usual vein, always offer renewed pleasure and profit in contemplation, were Ben Foster, Childe Hassam, Elmer Schofield, Gifford Beal, Jonas Lie, Robert Henri, Leopold Seyffert, and Charles Hopkinson.

**CHICAGO ART INSTITUTE EXHIBIT.** The twenty-ninth annual exhibition of American painting and sculpture at the Art Institute, held in November, assumed an unusually festive air in 1916, owing to the fact that it took place, for the first time, in new, admirably appointed galleries. A representative group of over 300 paintings occupied the upper galleries, while the lower floor contained a large and comprehensive display of sculpture, including works by Lorado Taft, Bela Pratt, Herbert Adams (with 17 pieces), Charles Grafly, Anna Hyatt, the late Edith Woodman Burroughs, Sherry Fry, the late Karl Bitter, and Albin Polasek, who is the newly appointed head of the Institute school of sculpture. The Potter Palmer gold medal and prize was awarded to Emil Zettler for his forceful statue "Job." "The Hammock," by Frederick Frieseke, received the first Norman Wait Harris prize, and "Mountain Courtship," by James P. Hopkins, the second. The Martin R. Cahn prize went to Walter Ufer. Well-known Western artists were adequately represented, together with works by Eastern men, already familiar through other exhibitions.

**NATIONAL ACADEMY, WINTER EXHIBITION.** Comparative bareness of the walls and really commendable results in the grouping of the pictures were noticeable on entering the galleries of the winter exhibition of the National Academy. As usual, through limited space, only about two-thirds of the accepted pictures could be placed, 381 paintings in all, of which 218 were by non-members. Western artists, and others lately returned from abroad because of the war, helped to swell the ranks of the familiar exhibitors. On the whole, the impression gained was one of usual competency, likewise well-ordered respectability. Few manifestations of revolutionary tendencies were visible to enliven the outlook. The awards were quite in line with the usual policy of the Academy. To Lawton Parker, the Chicago artist, fell the first Altman prize and Inness gold medal for his large painting of a handsome nude, good in color, conventional in composition. The second Altman prize was awarded to Irving Couse for a well-composed Indian group, carefully placed upon a pedestal, as it were, and with an unnecessarily sentimental appeal. The Thomas R. Proctor prize for the best portrait went to Philip Hale for a strong and forcefully conceived old sea-salt, "Cap'n Peter Turner," and "Maine Cliffs in Moonlight," a fine mellow work, brought the Carnegie prize to Howard Russell Butler. "Doris in the Parlor," a quaint child with staring eyes, painted with more sentiment than is usually perceptible in Mr. Bellows's clever work, was awarded the Isidor medal for the best figure composition of an artist under 35. Among the various portraits shown may be mentioned Marie D. Page's serious little girl, which won

the Julia D. Shaw Memorial prize, creditable efforts by Matilda Brownell, Lydia Emmet, Emil Fuchs, and Mary Foote; a minutely executed representation of Giuseppe Trotta by Sidney Dickinson and Karl Anderson's curiously indecisive group entitled "Sisters." Childe Hassam's favorite window theme was represented in a fresh and cheerful manner, while a highly illuminated nude study by Charles Hawthorne, of decidedly realistic trend, was a welcome effort to paint outside the sphere of "things unseen." A little interior by Helen Turner displayed much vivacity of color, and the "Oval Mirror" by Richard Miller pleased with its suavity and flowing line. An ambitious undertaking was Luis F. Mora's large canvas, "An Out of Town Trolley," which certainly showed as large a collection of widely divergent types as could be gathered together in one car at the same time. A commanding position was given to the late William M. Chase's early portrait of a lady in black, loaned by the Union League Club.

Characteristic landscapes were submitted by Ernest Lawson, Jonas Lie, Ben Foster, Gardner Symons, Albert Groll, John Carlsen, Daniel Garber, and other familiar artists. The most decisive note in the small sculpture exhibit was struck by the two highly interesting groups of Cecil Howard, in especially the "L'Après-Midi d'un Faune." The Elizabeth N. Watrous gold medal went to Herbert Adams's graceful "Nymph of Fynmere," and the Helen Foster Barnett prize to Laura Gardin Fraser. A few interesting portraits by Charles Hafner and Malvina Hoffman and others, and a number of small animal groups completed the sculpture exhibit.

**OTHER EXHIBITIONS.** Early in January an important exhibition of oil paintings and water colors by Cézanne was held in the Montross Gallery. Exhibitions of works by El Greco, Zuloaga, Van Gogh, and a benefit exhibit of Ralph Blakelock's landscapes, including his three famous "Moonlights," were held in New York galleries. A "Retrospective Collection of French Art" and a large exhibition of American sculpture, organized by the National Sculpture Society, were included in the activities of the Albright Art Gallery, Buffalo. Other exhibitions of sculpture at the Gorham galleries provided a field for a general survey of this kind. The "National Arts Club Prize" of \$1000, awarded at the club's exhibition in 1916 for the first time, was given to Ben Foster for "October," a typical product of American landscape painting, showing unusually fine feeling for composition.

**OTHER EVENTS.** A noteworthy event of the year was the opening, in Cleveland, of one of the largest and most beautiful art museums in the United States. It is built of white marble, on classic lines, and already possesses a nucleus of art treasures in early Italian, early American, and contemporary French paintings, and seventeenth century Flemish tapestries. As an exhibitor of the numerous traveling exhibitions of native and foreign artists, visiting the chain of museums across the country, it will take an important place.

**METROPOLITAN MUSEUM.** During the year the Metropolitan Museum of Art acquired the important "Colonna Madonna" by Raphael, a gift from Mr. J. P. Morgan; Regnault's famous "Salome," donated by Mr. George F. Baker,

and "Madame X," a tour de force of portrait painting, by John S. Sargent. Representative examples by Wilhelm Leibl, Max Liebermann, Hans Thoma, and Wilhelm Trübner were acquired with the fund left by the late Hugo Reisinger for the purchase of modern German paintings. The installation of the "Tomb of Perneb," the largest monument of the kind ever imported from Egypt, was an event of importance in the Egyptian department. A new department of Far Eastern art, organized under the able direction of Mr. S. C. Bosch-Reitz, was opened with an exhibition of ancient Chinese sculpture and pottery. The collection of ancient pottery exhibited was the finest of its kind ever assembled in the Western world. Here for the first time the American student could obtain a comprehensive idea of these wares: the stately T'ang (A. D. 618-907) ware, with its noble forms and Greek reminiscences; of the different varieties of the multi-colored Sung (A. D. 960-1280) ware, including the white and creamy Ting; the etched and tinted Tzu-chou ware; the wonderfully tinted Chün ware, particularly the gorgeous purples and reds; the ancient celadons, both Sung and Korean.

The educational activities of the museum showed decided growth. A number of courses were offered by the members of the museum staff and outside lecturers. The School Art League for the promotion of the knowledge and appreciation of art in the public schools offered lectures and instruction. Largely attended courses, treating the art objects of the museum from the originals, were offered by the Extension Department of Columbia University. The schools of decorative design of New York held regular sessions in the museum galleries and the workers in fine and applied design made increased practical use of the different departments of the museum. Similar work, though on a less extensive scale, was carried on in other museums, as at Boston, Chicago, Toledo, Cincinnati, Buffalo, Worcester, and elsewhere.

**SARGENT AND BARTLETT.** Important in the annals of American mural decoration was the placing in position in the Boston Public Library of six lunettes, by John S. Sargent. These new additions, which almost complete the original scheme of decoration, give a general impression of rich beautiful color and grandiose conception. The subjects, illustrating phases of Jewish and Christian faith, include such titles as the "Messianic Era," "Law," "Judgment," and "Gog and Magog." In the field of civic sculpture note should be made of the completion of the impressive pediment group for the house wing of the national capitol, by Paul Bartlett. The subject, "Life and Labors of the People," is embodied in a large central group, "Peace Protecting Genius," flanked on either side with symbolic representations of agriculture and industry.

**ART SALES.** The public sales of important private collections held during the year were on an unprecedented scale. They included the large Catholina Lambert collection of old and modern paintings, from which the Brooklyn Institute Museum acquired an imposing altarpiece attributed to Luini; the Hugo Reisinger collection of modern paintings; and the Davanzati Palace and Villa Pia collections of Italian Renaissance furniture, sculpture, and paintings, belonging to Prof. Elia Volpi. Important pur-

chases of old masters included two life-size marbles by Donatello, a figure "David," and a youthful bust of "St. John," acquired by Mr. J. E. Widener of Philadelphia. These two marbles, splendid examples of the master's art, had been in the possession of the Martelli family, Florence, for over four centuries. Other important purchases were: Gainsborough's "Mall," by Henry C. Frick; a Rogier van der Weyden, once in possession of Queen Isabella of Spain, purchased by Michael Dreicer; and five of Van Dyck's masterpieces from the Earl of Denbigh's collection, which were purchased by a New York art firm.

**ART ABROAD.** In England the customary Royal Academy exhibitions appeared to be unusually dreary and uninteresting. Many of the paintings showed war subjects, but were lacking in originality or force. Public art activities were completely suspended. Similar conditions prevailed, to a large extent, in France. In Germany conditions seemed more normal, with the fairly regular appearance of art publications and the usual activities of sales and exhibitions. Stirring lithographs by both French and German artists constituted perhaps the most important output. The discovery of a "Christ" attributed to Mantegna, and now in the Modena Gallery, was probably the most important art event in Italy.

See UNITED STATES NATIONAL MUSEUM.

**PALMER, ALICE FREEMAN.** See LITERATURE, ENGLISH AND AMERICAN, *Poetry*, American.

**PANAMA.** A republic situated between Costa Rica and Colombia. Formerly a department of Colombia, it declared its independence Nov. 3, 1903. The city of Panama, on the Pacific coast, is the capital.

**AREA AND POPULATION.** The estimated area is 87,480 square kilometers (33,776 square miles). This area will be somewhat reduced if the Costa Rica boundary is finally delimited in accordance with the decision (announced in 1914) of Chief Justice White of the United States Supreme Court, to whom the boundary dispute had been submitted—a decision which Panama refused to accept. The population of the republic (exclusive of the Canal Zone) is probably about 375,000. The estimated population of the city of Panama was 60,000 in 1915, and of Colón 30,000. Other important towns are David and Bocas del Toro. The Canal Zone is American territory, extending to a width of five miles on either side of the middle of the Panama Canal, but excluding the cities of Panama and Colón. The population of the Canal Zone was reported in 1916 at 31,048; the military numbered 7451 and civilians employed by the canal 11,742, of whom 3598 were Americans.

**PRODUCTION, COMMERCE, ETC.** The resources of the country are developed only to a small extent. There is much fertile soil, but the proportion under cultivation is not large. The forests contain some mahogany and other valuable woods. Various mineral deposits are reported, but they are not worked to any considerable degree. Manufacturing is unimportant. The chief crop is bananas; other products of some account are corn, sugar cane, cacao, tobacco, yams, coffee, coconuts, and rubber. Cattle raising is carried on with some success.

Imports (exclusive of non-dutiable supplies for the Panama Canal) and exports have been valued as follows:

	1912	1913	1914	1915
Imps. . . . .	\$9,871,617	\$11,397,000	\$9,885,447	\$9,805,447
Exps. . . . .	2,064,648	5,888,027	3,800,517	.....

Imports come largely from the United States, while the great bulk of the exports go to that country. Trade by countries, in thousands of dollars:

	Imports		Exports	
	1914	1915	1914	1915
United States . . . . .	6,896	7,023	2,270	3,863
United Kingdom . . . . .	1,886	1,175	110	.....
France . . . . .	218	180	2	.....
Germany . . . . .	460	10	126	.....

Principal exports to the United States in 1915: bananas, \$2,197,250; balata, \$328,662; coconuts, \$251,086; hides, \$183,322; ivory nuts, \$102,800; ipecac, \$90,043; tortoise shell, \$37,634; cacao, \$32,671; and rubber, \$23,373.

The city of Panama has rail connection with Colón, 48 miles; this is the Panama Railway, owned by the United States government. On April 21, 1916, the first passenger train ran from David to Boquette, 56 miles. There is also service over the branch from David to Concepción, 18 miles, and from David to Pedregal, the Pacific terminus. In the Bocas del Toro region, light railways, chiefly for the banana industry, aggregate upwards of 150 miles. On the Chirique Railroad 40 miles of line were completed between the port of Pedregal and Boquette and on the branch connecting Porterillos and Concepción. Dock No. 7 at Cristobal for the Panama Railroad was completed at a cost of \$1,400,000. At this place the laying of the remainder of the track for the new railroad yard was begun late in the year, the work having been delayed by the non-arrival of railroad ties from the United States.

Telegraph offices, about 40; post offices, about 100.

**FINANCE AND GOVERNMENT.** The standard of value is gold; the monetary unit is the balboa, equivalent to the American dollar. For the two-year period 1915 and 1916, the budget balanced at \$10,622,000.

The president is elected for four years by direct vote and is ineligible for the next term. He is aided by a cabinet of five members. Three designates are chosen by the National Assembly to succeed, in order, to the executive power in case of absence or disability. The National Assembly, which exercises the legislative power, is a single chamber of 33 members, elected by direct vote for four years. The president for the term beginning Oct. 1, 1916, is Ramón M. Valdez, who succeeded Belisario Porras. Designates: first, Ciro L. Urriola; second, Ramón F. Acevedo; third, Pedro A. Díaz. Each of the provinces is administered by a governor appointed by the president.

**HISTORY.** Contending that the United States was by treaty stipulations under obligation to supervise elections, the Conservatives and a portion of the Liberal party headed by former Vice-President Chiari, petitioned the United States government early in March to supervise the presidential election which was to take place in July. They argued that a fair election was impossible since the election machinery and the police were under the control of the followers

of former President Porras, who were supporting Dr. Ramon Valdez, and who were said to be hostile to American supervision. On May 14th the United States government demanded the surrender of the rifles of the Panama police. They were delivered and ordered to be sent to the Panama consul in New York and were to be sold there. A number of Panama citizens protested against this disarming of the police. During the presidential election, June 25th, riots occurred in which three persons were killed. Former Vice-President Dr. Ramon Valdez, the government candidate, who had at one time been minister to the United States, was elected president.

**PANAMA-CALIFORNIA EXPOSITION.**  
See EXPOSITIONS.

**PANAMA CANAL.** As a result of slides in the Culebra cut in September, 1915, traffic through the canal was cut off until March 27, 1916, when two United States supply ships with light draught passed through. Regular traffic was resumed through the canal on April 15th, when 16 ships, 7 northbound and 9 southbound, passed through. On May 11th, Major-General Goethals announced that on June 1st he would resign as governor-general of the Canal Zone.

By the 1st of September a large number of steamship companies had established regular services through the canal. These included four services from the Atlantic terminus, through Central and North America; three from the Atlantic coast of the United States to the Pacific coast of South America; four from Europe to the Pacific coast of South America; four from Europe to the west coast of North America; nine from the Atlantic coast of the United States to Japan, Siberia, China, and the Philippines; six from the Atlantic coast of the United States to Australia and New Zealand; and two from Europe to Australia and New Zealand.

On August 14, 1916, two years of service of the canal were completed. It was opened to commercial traffic on Aug. 15, 1914. During the two years a total of 2097 ships passed through the canal, an aggregate tonnage of 7,046,407. These vessels carried cargoes amounting to 9,031,613 tons, of 2240 pounds. Of the ships passing through 1055 passed from the Atlantic to the Pacific, and 1042 from the Pacific to the Atlantic. The second year had only 59 per cent as many ships as the first, 53.5 per cent as much net tonnage, and 52.8 per cent as much cargo. This decrease was caused by the fact that the canal was closed approximately one-half the period during the year Aug. 15, 1915, to Aug. 14, 1916.

**PANAMA-PACIFIC EXPOSITION.**  
See EXPOSITIONS.

**PAN-AMERICAN SCIENTIFIC CONGRESS.** This Congress, the second to be held, convened in Washington on Dec. 27, 1915, and its session continued through the first two weeks of January, 1916. There were present many of the most distinguished scientists, educators, and publicists of the United States and of the Central and South American states. Eduardo Suarez, the ambassador from Chile to the United States, was the president of the congress. The purpose of the meeting was the correlation and exchange of new views where they had a bearing on Pan-American science, art, and conduct of human affairs generally, with an aim of furthering the progress of civilization. There were present at the congress more than 650 members.

of the faculties of the leading colleges and universities and more than 350 scientific and commercial bodies were represented. On Dec. 28, 1915, a notable address was delivered by Elihu Root. In this he urged the protection of the weak nations against the strong by the adoption of international rules of right conduct. For the first weeks of its session the dominant topics discussed by the congress related to political association and cooperation.

On January 6th President Wilson addressed the congress, dwelling in particular upon the relations of the United States with Latin-American countries. He suggested the proposal submitted to the South and Central American representatives in the previous week by Secretary Lansing as a basis for an effective agreement between all the republics of the western hemisphere "not only for the international peace of America, but the domestic peace of America." This programme, as outlined by the President, proposed that all the American nations should unite in guaranteeing to one another absolute independence and territorial integrity; that they should agree to settle all pending boundary disputes as soon as possible by friendly process; that they should agree to handle all disputes arising among them by patient, impartial investigation and to settle them by arbitration; that they should agree that no revolutionary expedition shall be outfitted against, or supplies for revolutionists shipped to, neighboring states. On January 8th, the delegates were guests of Secretary Lansing at a banquet. The addresses delivered emphasized the growing tendency toward closer relations among the American republics. The delegates on January 6th selected Lima, Peru, for the next session of the congress. This meeting is to be held in 1921, which is the centennial of the declaration of independence by Peru.

**PAN-AMERICAN INTERNATIONAL HIGH COMMISSION.** This commission, which was appointed by the Pan-American Scientific Congress at Washington, met at Buenos Aires on April 3rd, to consider the unification of legislation on commercial affairs relating to the American republics. Dr. Victorino De La Plaza, president of the Argentine republic, presided at the opening of the meeting. The representatives of the various countries included William G. McAdoo, Secretary of the Treasury, and the Minister of Finance of Brazil, Chile, Uruguay, and Ecuador. The other American republics sent delegates. The commission considered many matters of importance, and made a number of recommendations. It adopted resolutions declaring the creation of an American merchant marine of the greatest importance. There was also a strong sentiment in favor of cooperation between the leading South American republics and the United States, and the opinion was expressed that full development of such relations was impossible without an adequate American merchant marine. The conference adopted the franc, of the value of one-fifth of the United States gold dollar, as a unit of money for Pan-America. The conference urged the rapid completion of an inter-continental railway system, and the improvement of telegraphic and cable facilities in order to bring the American republics into closer union. It was recommended that governments control all wireless communications. The conference agreed, with one ex-

ception, to all the reservations made by various countries in The Hague Convention in 1912 with relation to the adoption of a uniform law for bills of exchange. Resolutions were also adopted for making clear international conventions relating to trade marks and copyrights. The arbitration plan negotiated between business men of the United States through the efforts of the Chambers of Commerce of the United States and Argentina were unanimously approved. The delegates of Uruguay gave notice of the intention of that country to sign an agreement of this nature. The revision of laws relating to commercial travelers and samples in order to unify these and reduce the taxation levied upon travelers was unanimously approved, as were also tariff statistics based on uniform classification. The commission recommended the simplification of port charges and consular fees and the reduction of postal rates.

On April 15th a permanent organization of the International High Commission was perfected. Secretary McAdoo was elected president, John Bassett More, vice-president, and Dr. L. S. Rowe, of the University of Pennsylvania, secretary-general. Headquarters are to be established in Washington. The functions of the commission are chiefly to effect uniformity of laws in the Pan-American nations. The commission is composed of nine members, including the Secretary of the Treasury and the finance ministers of the other American republics.

**PAPER.** In one form or another the effects of the war were seriously felt in the paper industry in 1916. Diminished production of paper and paper materials was experienced in the belligerent countries, which in many cases, to a considerable extent, were cut off from the normal supplies of raw materials as well as the finished product. The production of Europe, it was estimated, was cut to at least 60 per cent of normal. In the United States there was a period of prosperity and considerable profit for paper makers such as had not been experienced for several years, but as this was marked by a shortage in product in the face of a heavy demand and higher costs of materials there were corresponding high prices to which consumers took exception. This development, along with the general methods of distribution, led to an investigation of the newsprint paper situation by the Federal Trade Commission, which was still in progress at the end of the year. It may be said that any controversy as regards prices in the paper industry, especially where newsprint paper is involved, always becomes acute in the United States on account of the influence of the daily and weekly papers and their ability to direct public and legislative attention to any real or alleged disadvantages under which the publishers labor. In 1916, with the scarcity and high prices, it was alleged that many small publishers were practically deprived of their supplies and that the large consumers were favored. This, it was suggested by the Federal Trade Commission, was due as much to the jobbers as the manufacturers, and much attention was directed at the hearings to this side of the matter. The whole subject was investigated and discussed on many sides with the aim of securing relief for the smaller consumers in this era of high prices and scarcity. Price fixing powers were urged for the commission, and even an embargo on the export of paper and pulp was

proposed. Efforts were made to have the larger publishers share with the smaller people the material they had contracted for and whose deliveries they were in a position to enforce, but this did not appeal either to the manufacturers or to the large metropolitan journals and their supply agents. The manufacturers, while admitting the high prices and also their own prosperity in 1916, claimed that the industry had suffered previously and was hardly in a position to withstand radical action by the government. They called attention to the fact that in 1916 but one new newsprint mill had been built in the United States, though there were great developments in Canada, and threats were made that with more unfavorable conditions American newsprint mills would be dismantled and their machinery taken across the border to still further accelerate the industry there. Many American paper manufacturers frankly wanted tariff protection in the event of the termination of the war and were bitter against government interference and hostility.

At the end of the year all raw materials had continued to advance and the renewal of contracts at higher figures was generally predicted. White sulphate and soda pulp prices had increased and were expected to advance further and the price of rags was increasing with but a limited supply. The demand for paper was large and with the decreased supplies of foreign materials there was a shortage of labor as the prosperity of the country tempted men away from the outdoor labor of the woods and also both men and women from paper mills. Notwithstanding the demand the increase in the payrolls of the paper mills in 1916 was estimated at 35.6 per cent over 1915 and an increase in numbers of 20 per cent. The production of newsprint was about the same in 1916 as in 1915, but there were increased shipments and the stocks on hand at the end of the year were much less than in the beginning. At the same time the exports from the United States increased during the year.

The scarcity of paper in the United States led to many economies in the use of wrapping paper and in the collection and working over of waste paper. In many cities the price of newspapers was increased from one to two cents and it was thought at the end of the year that the tendency to raise the price might become general even for the larger cities, where in many cases it had been found necessary to cut down the size of the paper and stipulate that there could be no return copies. A development of the year that was agitated was the use of paper milk bottles in order to secure greater sanitation.

The paper industry in Canada in 1916 was of great importance in the commerce of that country. In 1892 the exports of paper amounted to just \$91, growing to \$24,000 in 1902, and to \$6,327,000 in 1913. In the fiscal year ended July, 1916, the exports of paper were valued at \$21,678,086, and the total exports of paper, pulp, and pulp wood at \$40,865,266. Of the exports of paper in 1916 88 per cent was taken by the United States and 5.2 per cent went to the United Kingdom. Of the total exports of paper, pulp, and pulp wood, 87 per cent went to the United States and only about 5 per cent to the United Kingdom. Canada imported \$6,327,298 of paper and paper manufactures. At the end of the year there was a controversy in Canada be-

tween the government and the manufacturers and an attempt was being made to establish a price fixing scheme.

In the fiscal year 1916 it was estimated that Canada consumed pulp wood valued at \$9,500,000, which naturally was a vast drain on the forests, and not only were new lands being exploited, but a general policy of conservation was being demanded as necessary to the future of the Dominion. In new forests Alberta was considered a promising field and new companies were being organized to work this region.

In Great Britain the Board of Trade had restricted the imports of paper and during the year the Royal Commission on Paper was instructed to cut down the importation of paper making materials as well as the manufactured article; one-half the amount of the 1914 supplies being set as the permissible figure. Naturally high prices ruled in Great Britain and supplies for its paper mills were hard to get. Paper makers urged that the amount of food coming into the Kingdom would not be diminished by permitting the imports of paper making materials, for the greater part of them came from neutral countries.

The paper situation elsewhere in Europe was, to say the least, complicated. Germany was buying up all the possible pulp in Scandinavia, but still its supplies were short. Norway had placed an embargo on shipments of sulphur and pyrites to Sweden, with the result that the industry in the latter country was somewhat embarrassed and several mills were forced to close. Sweden had laid an embargo on shipments to England. Russia had a paper shortage and the production and imports from Sweden had fallen off so that Norway was exporting to Russia and Siberia. See CHEMISTRY, INDUSTRIAL.

**PAPINI, GIOVANNI.** See ITALIAN LITERATURE.

**PAPUA, TERRITORY OF.** Prior to Sept. 1, 1906, BRITISH NEW GUINEA. A dependency of the Commonwealth of Australia, by which it has been administered since 1901. The capital is Port Moresby. The Territory of Papua consists of the southeastern part of the great island of New Guinea, together with numerous small islands lying mostly to the southeast (including the D'Entrecasteaux and Louisiade groups). The total estimated area is 90,540 square miles, of which the islands comprise 2754 square miles. The native population has been variously estimated at from 250,000 to 400,000. Whites in 1914 numbered 1186. The soil is fertile, and in 1914 plantations aggregated 42,291 acres, of which 29,030 acres were under cocoanuts, 6606 under rubber, and 3110 under sisal. Indigenous sago grows on hundreds of square miles, and an estimated 350,000 acres are under native-owned cocoanuts. As far as the British administration has been effectively extended, the natives are obliged to plant cocoanuts for food supply. The forests contain valuable timbers, much of which is accessible by river. Gold mining is an important industry on the mainland, in the Louisiade Islands, and in Woodlark Island; copper mining showed rapid development from 1910 till 1915, but in the latter year copper ore exports declined sharply. Indications of petroleum occur over large areas. In the year 1913-14, imports and exports were valued at £212,134 and £123,140 respectively; in 1914-15, £202,055 and £84,712. Exports of copper ore in the

two years, £19,733 and £5606. Gold output in 1913-14, £41,422; in 1914-15, £50,839. The trade is chiefly with Queensland and New South Wales. The local revenue and the expenditures in 1913-14 were £54,703 and £81,095; in 1914-15, £51,906 and £82,535.

**PARAGUAY.** An inland South American republic, bounded by Bolivia, Argentina, and Brazil. The capital is Asunción, a port on the Paraguay River.

**AREA, POPULATION, ETC.** That part of the country known as Paraguay proper, lying between the Paraguay and Upper Paraná rivers, has an estimated area of 253,100 square kilometers (about 97,700 square miles); a nearly equal area, between the Paraguay and Pilcomayo rivers, is claimed by both Paraguay and Bolivia, but is usually regarded as Paraguayan. This disputed region, the Chaco, is sparsely populated; its inhabitants are chiefly Indians, supposed to number some 50,000. The population of Paraguay proper has been estimated at 800,000; the people are largely a mixture of Spanish, Guarani, and negro blood, but there are many persons of pure, or nearly pure, Guarani blood. The population of Asunción, which has been estimated at 84,000, was said in 1916 to be "rapidly approaching 100,000." The population of Villa Rica is estimated at 30,000; Concepción, 25,000; Carapeguá and Luque, each 15,000; Encarnación, 12,500. During the decade 1906-14 registered births numbered 161,852 (83,873 males, 77,979 females), and deaths 70,178 (33,667 males, 35,511 females). Immigration, though encouraged by the government, is small.

Elementary instruction is free and nominally compulsory. The number of elementary schools reported for 1916 is 1046, with 1558 teachers and an enrollment of about 80,000 pupils. There are three national colleges (secondary schools), the principal one at Asunción and two small ones at Villa Rica and Villa del Pilar. The government maintains about 50 students in Europe and the United States. The state church is the Roman Catholic, but the public exercise of other religious forms is permitted. Civil marriage is obligatory.

**PRODUCTION, COMMERCE, ETC.** The soil and climate of Paraguay are favorable for the cultivation of many tropical and sub-tropical products, but agriculture is not yet highly developed. The principal crops are yerba maté, corn, beans, alfalfa, manioc, and various fruits, especially oranges. Cotton, sugar cane, sweet potatoes, rice, etc., are also cultivated. Cattle raising is important. The number of cattle in 1915 is reported at 5,249,043; horses, 478,000; mules, 17,000; asses, 18,000; sheep, 600,000; goats, 87,000; swine, 61,000; total number of head, 6,510,043, as compared with 3,002,428 in 1902. The exports of cattle from 1910 to 1915 inclusive are reported at 199,151 head. There is little manufacturing or mining. Large deposits of kaolin were reported in 1916.

Import and export values have been reported as follows, in thousands of dollars:

	1911	1912	1913	1914	1915
Imports .....	6494	5190	7876	4995	2384
Exports .....	4594	4109	5462	4447	5448

Imports of textiles (chiefly cotton goods) were valued at 986 and 770 thousand dollars in

1914 and 1915 respectively; foodstuffs, 1316 and 640; hardware, 1127 and 311; drugs and chemicals, 228 and 114. The principal exports are quebracho extract, cattle hides, yerba maté, tobacco, woods, oranges, cattle, and beef products. Trade by principal countries, in thousands of dollars:

	Imports		Exports	
	1914	1915	1914	1915
United Kingdom .....	1,138	771	112	191
Argentina .....	902	765	2,685	3,528
United States .....	416	210	11	294
Italy .....	346	170	82	87
Germany .....	1,356	162	786	4
Uruguay .....	87	30	573	557
Netherlands .....	10	18	107	586
Total, including others ..	4,995	2,834	4,447	5,448

A railway is in operation from Asunción southeast through Villa Rica to Encarnación, on the Upper Paraná (376 kilometers, or 234 miles). From Encarnación trains are ferried to the town of Posadas, an Argentine railway terminus. Telegraph line, over 2000 miles, with 64 offices. Radiotelegraph stations are installed at Asunción, Concepción, and Encarnación. Post offices, 385.

**FINANCE.** The peso as a money of account is equivalent to 96.47 cents. The actual peso in circulation is paper, of fluctuating and greatly depreciated value. During the great war it has been current at only about 2½ cents. Estimated revenue for 1916, 2,223,927 pesos gold and 38,463,600 pesos paper; estimated expenditure, 2,130,907 pesos gold and 42,767,160 pesos paper. The estimated gold receipts were: from imports, 801,000 pesos; from exports, 910,800; from other sources, 512,127 pesos. The reported outstanding foreign debt on Dec. 31, 1915, was \$1,153,503 and 68,227 pesos gold. The acknowledged internal debt at the end of 1914 was \$401,649 (exclusive of paper currency).

**GOVERNMENT.** The executive power is vested in a president, who, with a vice-president, is elected for four years by indirect vote. The legislative power is exercised by a congress of two chambers, the Senate and the Chamber of Deputies. Senators (13 in number) are elected for six years by direct vote; deputies (26) for four years. On Aug. 15, 1916, Manuel Franco was inaugurated president, in succession to Eduardo Schaerer. The new vice-president is José P. Montefo, succeeding Pedro Bobadilla.

It was reported in October, 1916, that the Paraguayan Railway had suspended operations because of serious strike disorders. Strikers and their sympathizers attacked a number of trains and burned several bridges.

**PARALLAX.** See ASTRONOMY.

**PARALYSIS, INFANTILE SPINAL.** See POLIOMYELITIS.

**PARATYPHOID FEVER.** Antityphoid vaccination has almost entirely stamped out typhoid in the army, but another, though less fatal, type of enteric fever broke out among the troops on duty in Texas along the Mexican border. This is paratyphoid fever, which attacked over 130 men of the Fourteenth Regiment and 14 among the Seventy-first Regiment of New York City, besides many others. Examination by the State Department of Health detected 40 carriers, many of whom had no history of illness. Paratyphoid fever is due to two varieties of bacilli (designated A and B), which are

similar in appearance and have similar characteristics to those of typhoid fever. The attacks last a week or more, and no specific treatment is known. Vaccination is practiced as a prophylactic. One observer has seen 40 cases of pyelitis, a serious complication. See TYPHOID FEVER.

**PARCEL POST.** See UNITED STATES, Post Office.

**PARETO, VILFREDO.** See ITALIAN LITERATURE.

**PARK COLLEGE.** A co-educational institution at Parkville, Mo., founded in 1875. It is under the auspices of the Presbyterian Church. The number of students in 1916 was 436 and the number of faculty members 23. The college has productive funds amounting to \$400,000 and in 1916 drew an income from all sources of \$117,063. The library contains 27,000 volumes. President, F. W. Hawley.

**PARKER, SIR GILBERT.** See LITERATURE, ENGLISH AND AMERICAN, Fiction, English.

**PARKS, NATIONAL.** Up to 1916 the administration of the national parks had not been delegated to any special service. The work was done by a small force in the office of the Secretary of the Interior. As the laws creating the various parks developed more or less they were administered as individual areas with no particular relation to each other. This method had been both inefficient and unsatisfactory. On Aug. 25, 1916, a law passed by Congress went into effect establishing a national park service. This law provided for the appointment by the Secretary of the Interior of a director, assistant director, chief clerk, and other employees of the National Park Service and put under the direction, subject to the supervision of the Secretary, the supervision, management, and control of the national parks and monuments and of the Hot Springs Reservation in Arkansas, which had been hitherto administered by the Department of the Interior. The act provided also that the Secretary of the Interior might make rules and regulations for the use and management of the reservations and prescribe punishment for the infraction of such rules and regulations. It also gave him the privilege to grant leases and permits for the use of the lands for the accommodation of visitors, in the reservations, for periods not to exceed 20 years, and for areas not to exceed 20 acres in any one place.

Since Congress inaugurated the policy of setting aside tracts of land in various sections of the country as pleasure grounds for the people, 16 parks have been created, the latest being the Hawaiian National Park in the Territory of Hawaii, and the Lassen Volcanic National Park in northern California. The total land comprised in these reservations is 4,821,302 acres. The following table gives the names of the national parks, the date of their establishment, and their acreage:

AREA OF NATIONAL PARKS

Park	Date of establishment	Acreage
Hot Springs Reservation, in Arkansas .....	Apr. 20, 1832	911.68
Yellowstone, in Wyoming, Montana, and Idaho ..	Mar. 1, 1872	2,142,720
Casa Grande Ruin, in Arizona .....	Mar. 2, 1889	480
Sequoia, in California ...	Sept. 25, 1890	161,597
Yosemite, in California ..	Oct. 1, 1890	719,622

Park	Date of establishment	Acres
General Grant, in California	Oct. 1, 1890	2,536
Mount Rainier, in Washington	Mar. 2, 1899	207,860
Crater Lake, in Oregon	May 22, 1902	159,860
Wind Cave, in South Dakota	Jan. 9, 1903	10,522
Platt, in Oklahoma	July 1, 1902 } Apr. 21, 1904 }	848.22
Sullys Hills, in North Dakota	Apr. 27, 1904	780
Mesa Verde, in Colorado	June 29, 1906 } June 30, 1913 }	48,966.40
Glacier, in Montana	May 11, 1910	981,681
Rocky Mountain, in Colorado	Jan. 26, 1915	229,062
Hawaii, in Territory of Hawaii	Aug. 1, 1916	75,295
Lassen Volcanic, in California	Aug. 9, 1916	79,561.58
Total		4,821,302.83

During the season of 1916 the number of tourists visiting in these parks aggregated 358,006, compared with 335,299 in 1915. Propagation of wild animal life is one of the most important functions of the national parks. Eventually they will become great nature schools to which students of animal life will resort for investigation and study. Wild animals in the Yellowstone Park have increased to such an extent owing to the protection afforded them as to warrant the Department in distributing them for propagation purposes to various parts of the country. A large number of elk, buffaloes, bears, mountain lions, and wolves were thus distributed in 1916. It is the desire of the authorities of the government to make the Grand Canyon of the Colorado, which is now a national monument, into a national park, in order to bring about the development of the reservations through the construction of roads, trails, and other improvements. The bill was introduced into the 64th Congress with the establishment of the Mount McKinley National Park in the Territory of Alaska. As noted above, Congress passed bills forming the Lassen Volcanic National Park in California, and the Hawaiian National Park in the Territory of Hawaii. The first has an area of 79,561 acres, and comprises the only region in continental United States which has shown recent volcanic action. In addition to this volcano it contains hot springs, mud geysers, ice caves, and lakes of volcanic glass, as well as many streams. The Hawaiian National Park has an area of 79,295 acres, and includes two famous active volcanoes.

**PASTEUR, LOUIS.** See RABIES.

**PATENTS.** See UNITED STATES.

**PATTERSON, THOMAS MACDONALD.** An American political leader, journalist, and lawyer, died in Denver, Colo., July 23, 1916. He was born in County Carlow, Ireland, in 1839, but came to the United States at 13 with his parents, who settled at Crawfordsville, Ind. After studying at Ashbury Academy (later De Pauw University), and being admitted to the bar, he volunteered for service in the Civil War. By 1872 he had settled in Denver, and thereafter he was identified with politics there, as city attorney, territorial delegate to Congress in 1875-77, Representative in the same body when Colorado was admitted as a State, member of the Democratic National Committee, and delegate to many national conventions of that party, United States Senator (1901-07), and a twice unsuccessful candidate for the

governorship. For a time he was alienated from his party, bolting on the nomination of Grover Cleveland for reelection, but returning in 1901. The *Rocky Mountain News*, which he had founded in 1890, and edited thereafter, he used to further political interests, and he made it a powerful weapon on behalf of the Populists during the years that he was identified with them—in 1900 he served as permanent chairman of the Populist National Convention. For many years he was considered the Democratic leader in Colorado.

**PAVEMENTS.** See ROADS AND PAVEMENTS.

**PAVLOV, IVAN PETROVITCH.** A Russian physiologist, died at Petrograd Feb. 11, 1916. Born in Rjasan in 1849, he graduated M.D. at Petrograd in 1883, and then worked in Germany under Heidenhain and Ludwig, the government having sent him abroad for two years' study in experimental medicine. In 1890 he was appointed professor of pharmacology at Tomsk. In the same year he went to Petrograd as professor at the Military Medical Academy. Remaining in the Russian capital he became director (1891) of the Institute for Experimental Medicine of the Russian Academy of Sciences, and in 1895 added to his other duties those of professor of physiology. Pavlov came to be recognized as the founder of a new school of Russian physiologists. He devoted himself to the study of the heart, glands, and digestive apparatus, and in 1904 received the Nobel prize in medicine for a work which was translated into English as *The Work of the Digestive Glands: Lectures*.

**PEABODY MUSEUM.** The Museum did not send its regular expedition to Central America during 1915-16. In the latter part of June, S. J. Guernsey, Assistant Curator of Archaeology and Ethnology, left for northeastern Arizona to take charge of the Museum's field work in that vicinity. Oric Bates, Curator of African Archaeology and Ethnology, was unable to continue excavations begun in 1913 at Marsa Matruh, between Alexandria and the Tripolitan border. He therefore proceeded to Gammal, in the Second Cataract district, where he excavated a site to which his attention had been called by Dr. Reisner. The results of this exploration will shortly appear in the Harvard African Series. The material found at Gammal is now at Cairo awaiting an opportunity for safe shipment. Mr. Bates obtained also four large flint knives of the finest Predynastic workmanship, ethnological material from the Abyssinian-Sudanese border—a collection of Bisharin baskets and steatite bowls, and one of Egyptian and Sudanese amulets.

By exchange with the Museum of Santa Cruz, Canary Islands, the Peabody Museum has obtained prehistoric material which well illustrates the character of the ancient Guanche culture as found on the Island of Teneriffe. During the year the department was engaged in preparing for publication the first number of the Harvard African Studies. Mr. John Koren, in charge of the Koren Arctic Expedition to Northern Siberia for the collection of zoölogical specimens, has forwarded the first lot of ethnological objects obtained from the Chukche of the Kolyma region. Two models have been added to the series illustrating the dwellings and home life of American tribes. One of these shows both the exterior and interior of the semi-subterranean dwelling of the Aleut of Unalaska

Island, and the other represents different types of habitations of the Eskimo of Norton Sound and the lower Yukon.

There has been received from Mr. John B. Stetson, Jr., a bronze bust of the late Prof. F. W. Putnam, by S. Eulalia, Paris, 1912, which has been placed in the eastern entrance hall of the Museum. Mr. Joseph Lindon Smith, the noted Boston artist, has presented four large paintings of monuments forming a part of the ruined city of Quirigua. These pictures were painted by Mr. Smith during his recent visit to Guatemala. Director of the Museum, C. C. Willoughby.

**PEACE MOVEMENT.** See INTERNATIONAL PEACE AND ARBITRATION.

**PEARSE, (PADRAIC) PATRICK.** An Irish revolutionist, executed for high treason in the Tower of London, May 3, 1916. He was born in Dublin in 1881, studied law, was admitted to the bar, but identified himself with the Gaelic League movement which was organized to study and revive the Irish language and traditions. He edited the League's journal, *The Morn of Light*, and later resigned to become headmaster of St. Edna's Secondary School for Boys at Rathfarnham, a Dublin suburb. Here he sought to train his pupils in the earnest study of Irish history and tradition. When the Irish volunteer movement began in opposition to the arming of Ulster, Pearse heartily supported it, but later became more radical and revolutionary, sympathizing with the extreme Sinn Fein party. He plotted with them in their preparations for an outbreak, accepted the position of provisional president of the Irish republic, and on April 24, 1916, the first day of the revolt, signed the proclamation in which the founding of the republic was announced and the order for unconditional surrender seven days afterward. Upon his surrender, with his fellow revolutionists, he was taken across the channel, tried by court martial, and shot in the Tower of London. Pearse was a man of culture, a poet, and an eloquent speaker and writer, but an idealist without much practical knowledge of affairs.

**PEAT.** See FERTILIZERS.

**PÊCHEURS DES PERLES, Les.** See MUSIC, Opera.

**PECK, GEORGE WILBUR.** An American governor, journalist, and author, died April 16, 1916, at Milwaukee, Wis. He was born in 1840 at Henderson, N. Y., but three years later his family moved to Wisconsin, where he was educated in the public schools and learned the trade of printer. At the opening of the Civil War he owned a half interest in the *Jefferson County Republican*. He enlisted and was promoted lieutenant. Afterward he was owner, successively, of the *Ripon Representative*, the *LaCrosse Democrat*, and the *LaCrosse Sun*, which he removed to Milwaukee and renamed *Peck's Sun*. Mr. Peck became noted for humorous sketches, especially for a series known as "Peck's Bad Boy," volumes of which appeared from 1882 till 1907. After serving as mayor of Milwaukee in 1890-91, he was elected Governor of the State, which office he held till 1895. There had been but two Democratic Governors of Wisconsin before him.

**PEEL, WILLIAM GEORGE.** An Anglican prelate, died April 15, 1916, in Mombasa. He was born in India in 1854 and was educated at the Church Missionary Society Theological School in London. After his ordination in 1879 he

went to India, where he was a master and then principal of the Church Missionary Society College at Masulipatam. From 1889 to 1899, when he became Bishop of Mombasa, British East Africa, he served as a secretary of the Church Missionary Society in India. Bishop Peel figured in the Kikuyu heresy case that caused a stir in 1914. The Bishop of Zanzibar charged that he and the Bishop of Uganda had been responsible for administering the communion to nonconformists at a missionary conference held in 1903. Questions, especially of discipline and church policy, came up for consideration before 14 Anglican bishops, presided over by the Archbishop of Canterbury. The charges were dismissed: but clergy were advised that the rules of the Church did not provide for such services as that at Kikuyu.

**PELLAGRA.** The pellagra situation in several of the Southern States still continues to be a serious problem for the sanitarian, and opinion is still divided as to the exact causation of the disease. Goldberger's theory, that it is a question of food, has support in the results he obtained in several institutions and in a convict camp. His summary follows: Diet is the common factor in the various treatments advocated, and to its success is largely due. Marked increase in the fresh animal and vegetable protein elements of the diet is favorable for recovery: while an abundant but one sided diet, chiefly of carbohydrates (wheat, corn, rice), free from fresh animal food and legumes, proved inviting to the development of the disease. The pellagra-producing dietary "fault" is capable of correction or prevention with animal or leguminous proteins.

Neshitt made a study on the sanitation and control of pellagra in Hanover County in North Carolina, in the rural sections of which an intensive effort at sanitation began in July, 1914. The effort was concentrated on excreta disposal and water supply in order to control intestinal infections, which were especially prevalent. By the beginning of 1915 every rural home, black and white, in the county had been supplied with a privy at the owner's expense. At that time there were about 12 privies in the rural district which were not provided with receptacles and in which there was not a more or less successful effort at fly proofing. The conditions were maintained, and, indeed, there was a marked improvement in this respect during 1915. In December, 1914, Prof. C. W. Stiles and Dr. L. L. Dumsden, of the United States Public Health Service, made a survey of the rural sections of this county with special reference to the method of excreta disposal in use. A second survey was made in December, 1915, by Prof. C. W. Stiles and Dr. George M. Cooper, director of the Bureau of Rural Sanitation of the North Carolina State Board of Health. The last survey disclosed the fact that on the system of scoring used by the United States Public Health Service, the rural sanitary index in New Hanover County has been increased in a single year by 45 per cent. The rural population has been instructed in all disease prevention methods with the exception of pellagra, the means of preventing pellagra being only recently established. The incidence of this disease in the rural section as in the city has increased during the past year. The incidence among the rural population from the cases reported shows three cases per thousand

inhabitants, while in the city the incidence is a little more than one case per thousand. Experience shows that there are a great number of mild cases of this disease which are not reported and in which the patients present themselves to physicians and hospitals for treatment. The numerical relation existing between the rural and city cases is about as stated above. The following conclusions seem to be justified: There is no existing relation between soil pollution and the incidence of pellagra. Close supervision of all cases, disinfection, fumigation, isolation, and the other usual means of controlling infection have no influence on pellagra incidence. Business depression, lack of employment, a limited market for products, and raised prices of food, with consequent increase of indigence, augment the incidence of pellagra very definitely.

Jobling and Petersen, studying the incidence of pellagra in Nashville, Tenn., from 1911 to 1916, by a pellagra commission, gathered data of more than 500 cases and studied the subject from every possible angle, including the relation of sex, age, race, season of the year, social and economic surroundings, housing, occupation, diet, milk and water supply, parasites, sewage disposal, and previous exposure. After studying the relations of these various circumstances to the occurrence of pellagra, they found no valid solution in the various theories already advanced. There were proteins in the diet and no marked excess of carbohydrates; the water supply was used by pellagrins and non-pellagrins in common; and sufficient vitamin-containing substances were present in the diet. The conclusions point toward the fact of a significant localization of this disease in certain areas of the city, which areas differ in only one respect from the non-pellagrous localities, namely, the method of sewage disposal.

Pellagra was largely confined to the unsewered areas of the city, and of those pellagrins who lived elsewhere, the majority had developed the disease while living in an unsewered neighborhood or on the edge of an unsewered area, or had been in the habit of visiting friends and relatives in an unsewered area. The sanitary conditions in the unsewered sections of the city were of the worst. In an area of a square mile in which pellagra and typhoid were most prevalent were found 1500 privies, rarely cleaned and almost never enclosed so as to prevent the entrance of flies. These privies were located seldom more than 50 feet, and frequently not more than 15 to 20 feet, from the kitchens of the houses. Two per cent of the kitchens were screened. Another significant fact brought out in the survey was that 78.8 per cent of the patients

had been in intimate contact with other pellagrins before they themselves had developed the disease. Finally, the installation of sewers in certain areas was followed by a decrease in the number of cases of pellagra originating therein, and the isolation of cases in certain institutions in which pellagra had made its appearance seemed to prevent the further spread of the disease.

**PENANG.** An island off the west coast of the Malay Peninsula. With other islands and some territory on the mainland, it constitutes a division of the Straits Settlements (q.v.).

**PENNSYLVANIA. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 8,591,029. The population in 1910 was 7,665,111.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn . . . . . 1916	1,450,000	56,550,000	\$54,854,000
1915	1,520,000	58,520,000	40,964,000
Wheat . . . . . 1916	1,875,000	26,125,000	42,322,000
1915	1,830,000	24,605,000	25,589,000
Oats . . . . . 1916	1,130,000	35,030,000	19,967,000
1915	1,140,000	43,320,000	19,061,000
Potatoes . . 1916	272,000	19,040,000	28,179,000
1915	280,000	20,160,000	15,120,000
Hay . . . . . 1916	8,255,000 <sup>a</sup>	5,208,000	71,870,000
1915	3,100,000	4,340,000	67,704,000
Tobacco . . 1916	86,100 <sup>b</sup>	49,096,000	6,972,000
1915	31,100	42,390,000	3,900,000
Rye . . . . . 1916	260,000	4,420,000	4,818,000
1915	274,000	4,932,000	4,148,000
Barley . . . . 1916	12,000	300,000	225,000
1915	8,000	236,000	177,000

<sup>a</sup> Tons. <sup>b</sup> Pounds.

**MANUFACTURES.** The census for manufactures for 1914 shows a consistent increase as compared with that for 1909 with the exception of the number of establishments, proprietors, and firm members, which show a decrease, but these decreases show no indication of a light decrease in the manufacturing activities of the State. The capital invested in manufacturing industries in 1914 was \$3,149,411,000, a gain of \$400,405,000 or over 14.6 per cent over 1909. The value of the products was \$2,832,349,000 in 1914, compared with \$2,126,742,000 in 1909, an increase of nearly 8 per cent. The salaries and wages paid in 1914 amounted to \$672,563,000, compared with \$566,524,000. The average number of wage earners in 1914 was 824,478, compared with 877,543 in 1909. The most important facts relating to manufacturing industries in 1914 in comparison with 1909 are shown in the following table:

	Census—		Per cent of increase, 1909-1914
	1914	1909	
Number of establishments . . . . .	27,521	27,568	-0.2
Persons engaged in manufactures . . . . .	1,060,562	1,002,171	5.8
Proprietors and firm members . . . . .	28,084	29,743	-5.7
Salaried employees . . . . .	108,050	94,885	13.9
Wage earners (average number employed during the year) . . . . .	924,478	877,543	5.3
Wage earners, by months:			
January . . . . .	945,481	819,927	.....
February . . . . .	949,917	825,082	.....
March . . . . .	962,114	835,617	.....
April . . . . .	955,614	844,230	.....
May . . . . .	942,197	850,373	.....
June . . . . .	936,124	867,526	.....
July . . . . .	920,404	860,425	.....
August . . . . .	914,502	878,808	.....

	Census—		Per cent of in- crease, 1909- 1914 1
	1914	1909	
September .....	917,925	911,802	.....
October .....	902,734	983,852	.....
November .....	873,138	947,698	.....
December .....	873,586	960,666	.....
Primary horse power .....	8,549,858	2,921,547	21.5
Capital .....	\$3,149,411,000	\$2,749,008,000	14.06
Services .....	672,563,000	566,524,000	18.7
Salaries .....	144,610,000	110,897,000	30.4
Wages .....	527,953,000	455,627,000	15.9
Materials .....	1,688,921,000	1,582,560,000	6.7
Value of products .....	2,832,349,000	2,626,742,000	7.8
Value added by manufacture (value of products less cost of materials) ..	1,143,428,000	1,044,182,000	9.5

1 A minus sign (-) denotes decrease.

**MINERAL PRODUCTION.** The estimated production of bituminous coal of the State in 1916 was 175,000,000 net tons, an increase compared with 1915 of 17,000,000 tons, or nearly 11 per cent. The largest factor in this increase was the activity of the iron and steel business, which resulted in the tremendous demand for coke. Coke made from both beehive and by-product was 10,000,000 tons more in 1916 than in the previous year. Railroad and general industrial demands broke all records for coal. Car shortage, insufficient labor supply, labor disturbances, and a lowering of the efficiency of the labor all restricted the production to such an extent that at times the mines of the State were not able to supply even the most urgent demands of their normal markets. Coal from Ohio, Indiana, and Illinois was shipped into Pennsylvania. A lack of transportation from mine to market was the most potent check on output. In the last quarter of 1915 and the first months of 1916 there was a marked shortage of cars. A temporary lull in demand in April relieved conditions somewhat and from May to August the supply of cars was more nearly normal. From September to the end of the year as the demand for coal increased the car shortage continued to become worse. Scarcity of labor was most apparent during the summer when cars were more readily to be had, but there was in reality no improvement in the supply of men as the year progressed. Central Pennsylvania was more seriously affected by the scarcity of labor and the labor troubles than the other bituminous fields of the State.

The production of petroleum in the State in 1915 was considerably less than in 1914. There were produced 7,838,705 barrels, compared with 8,170,335 barrels in 1914.

The iron ore mined in the State in 1915 amounted to 363,309 tons, compared with 406,326 tons in 1914. The value of the ore shipped from the mines in 1915 was \$333,697, compared with a value in 1914 of \$399,639.

**TRANSPORTATION.** The total number of miles operated in the State in 1915 was 12,954. There were constructed during the year 383 miles of new track. The railroad having the longest mileage is the Pennsylvania, 4527. The Delaware, Lackawanna, and Western operated 958 miles, the Delaware and Hudson 885, the Central of New Jersey 680, the Erie 1987, New York Central 919.

**EDUCATION.** The total enrollment in the public schools in 1916 was 1,504,794. The average daily attendance was 1,212,157. There were employed 42,727 teachers, of whom 9163 were male and 33,564 female. The average monthly

Y. B. 16—18.

salary of male teachers was \$68.60 and of female teachers \$50.55.

**FINANCE.** There was a balance in the treasury on Dec. 1, 1916, of \$4,617,202. The receipts for the fiscal year amounted to \$36,663,039, and the disbursements to \$35,489,553, leaving a balance in the treasury at the end of the fiscal year of \$5,790,687. The principal sources of revenue are corporation taxes, automobile license fees, and collateral inheritance tax. The principal expenditures are for public schools, construction of highways, and the support of hospitals and other State institutions. The public debt of the State was \$651,110.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the Pennsylvania State Lunatic Asylum at Harrisburg, the State Hospital for the Insane at Danville, State Hospital for the Insane at Warren, State Hospital of the northeastern district of Pennsylvania at Norristown, State Asylum for the Chronic Insane at Wernersville, Homeopathic State Hospital for the Insane at Allentown, State Hospital for the Criminal Insane at Fairview, State Institution for the Feeble-Minded of Western Pennsylvania at Polk, State Institution for the Feeble-Minded in Eastern Pennsylvania at Pennherst, Pennsylvania Village for Feeble-Minded at Glen Iron, State Hospital for Injured Persons at Fountain Springs. Hospitals are also maintained in all the mining regions of the State. The Pennsylvania Soldiers' and Sailors' Home at Erie is also under the supervision of the board of public charities. The penal institutions include the Western Penitentiary at Pittsburgh and Bellefonte, Eastern Penitentiary at Philadelphia, the Pennsylvania Training School at Morgantown, the Pennsylvania Industrial Reformatory at Huntingdon, State Industrial Training Home for Women at Muncie Station. In addition to these there are many State institutions which are under the semi-control of the Board of Public Charities.

A special committee of the bar association of the State which was appointed in 1916 to consider the revision of the State penal laws reported in July in favor of the abolition of the county jails as places of confinement for convicted prisoners. The committee recommended the establishment of six industrial farms in different parts of the State, where prisoners in the county jails can be provided for employment and compensation, on the same principle put in force in the prisons and reformatories under the prison labor commission, which was created by the Legislature of 1915.

**POLITICS AND GOVERNMENT.** The Legislature did not meet in 1916. The principal govern-

mental changes were the putting into practice of the workmen's compensation and the child labor laws, both enacted at the 1915 session. It was a favorable time for the introduction of innovations, since the extraordinary activity of most business and industries, coupled with the labor shortage and the upward trend of wages and prices of commodities and manufactured products, enabled adjustment to the changes and absorption of the added costs without difficulty; at a more normal time a problem might have been presented.

The national election had the curious effect of bringing back to the Republican fold nearly all of the Progressives who had not returned in 1914, and at the same time opening one of the bitterest factional fights for party control in the State that has waged for many years; the Democrats were firmly united and attracted many independent voters, so that President Wilson polled the largest vote ever given to a Democratic presidential candidate. The party enrollments of voters for the primary election of May 16th showed the Progressive party all but extinct; nevertheless those remaining true to the schism of 1912 elected a full delegation to the Progressive convention in Chicago. The Republican primary campaign was enlivened by a combination of Gov. Martin G. Brumbaugh with the Vares of Philadelphia to gain control of the delegation to Chicago in the interest of Theodore Roosevelt, the Governor announcing his own candidacy for the presidency with the intention of delivering the Pennsylvania delegates to Roosevelt. In the bitterness of the contest it was revealed that Governor Brumbaugh, when a candidate for the governorship in 1914, had accepted large sums of money for which he did not account in making return of his campaign expenses as required by law; one contribution of \$1000 by Mr. David B. Oliver of Pittsburgh was described by Governor Brumbaugh as a donation for his personal expenses, though his telegram and letter of acknowledgment proved he received the money as a campaign contribution. On his side of the contest, the Governor resorted to every means at his command to compel support of his faction, dismissing State Insurance Commissioner Charles Johnson for not electioneering for him. The regular Republican organization, under the leadership of Senator Boies Penrose, elected a majority of the delegates to the national convention. Former Secretary of State Philander Chase Knox was the organization's choice for the presidency, but his name was not formally presented to the convention. Governor Brumbaugh's was. On the first roll call the delegation was polled as follows: For Knox 36, Brumbaugh 29, Hughes 2, Roosevelt 8, absent 1. Governor Brumbaugh then withdrew, declaring himself for Roosevelt. The second roll call resulted: For Knox 36, Hughes 8, Roosevelt 23, Wanamaker 5, Dupont 2, Root 1, absent 1. On the final ballot the Pennsylvania delegation stood: For Hughes 72, Roosevelt 3, absent 1. Senator Penrose was elected Pennsylvania member of the national committee.

The Governor and the Vares had set up candidates in the primaries for the two State offices to be filled, State treasurer and auditor-general, but they were defeated.

The election campaign was tame, being characterized only by the unusual optimism of the

Democrats and real contests in a few congressional districts. Election returns showed:

For President—Hughes (Rep.), 703,734; Wilson (Dem.), 521,784; Benson (Soc.), 42,737; Hanly (Pro.), 28,525. For United States Senator to succeed George T. Oliver who declined to be a candidate—P. C. Knox (Rep., Keystone, Personal Liberty, Roosevelt Progressive), 680,451; Ellis L. Orvis (Dem.), 450,106; Charles W. Ervin (Soc.), 45,385; Herman T. Ames (Pro.), 30,089; scattering, 2409. For Congressman-at-Large—Thomas S. Crage, Mahlon M. Garland, Joseph McLaughlin, and John R. K. Scott (Reps.) were elected. For State Treasurer—H. M. Kephart (Rep., Bull Moose, Keystone, Personal Liberty), 667,144; James Cramer (Dem.), 463,503; Charles Sehl (Soc.), 44,963; E. J. Fithian (Pro.), 31,552; scattering, 2179. For Auditor-General—Charles A. Snyder (Rep., Keystone, Bull Moose, Personal Liberty), 682,940; James B. Murrin (Dem.), 448,856; Walter C. Tyler (Soc.), 47,258; William Repp (Pro.), 33,298; scattering, 2106. For Judge of the State Supreme Court (Non-partisan)—Emory A. Walling, 569,046; Charles Palmer, 250,933; scattering, 77. (Over a quarter of a million electors who voted for auditor-general did not vote for supreme court judge.)

Of the 32 congressmen elected in districts, 25 are Republicans and 7 Democrats. Notable victories were scored by the Democrats in the thirtieth and thirty-second districts, both in Allegheny County. In the former M. Clyde Kelly, who was beaten for the Republican nomination and was afterward placed on the Democratic ticket, defeated William H. Coleman, and in the latter Guy E. Campbell, a Democrat, was elected over A. J. Barchfeld. Coleman and Barchfeld are sitting Republican congressmen. Organized labor's dissatisfaction with the representatives' opposition to the Adamson bill and local option sentiment contributed most to the overturn in these normally strong protective tariff districts.

Immediately after the election a factional contest began for control of the legislative organization. Governor Brumbaugh and the Vares united again and the Governor employed his power to compel State department executives and employees to secure support for his candidate for speaker of the House of Representatives. He dismissed A. Nevin Pomeroy, State printer, from office and threatened others with a similar fate. He made no effort during the campaign nor after the election to advance the cause of local option, to do which he pledged himself in 1914 and which promise gained him much support in a bitter contest for the governorship.

The United States grand jury at Pittsburgh investigated the use of money by corporations in the Federal election of 1914 and returned 101 indictments against 72 brewing corporations and associations within and without the State for alleged violation of the United States Corrupt Practices Act. The defendants having moved to quash the indictments on the ground that the law was unconstitutional, Judge W. H. S. Thomson gave decision against their contention on December 23rd.

STATE OFFICERS. Governor, Martin G. Brumbaugh; Lieutenant-Governor, Frank B. McClain; Secretary of State, Cyrus E. Woods; Treasurer, Robert K. Young; Auditor, A. W. Powell; Adju-

tant-General, Thomas J. Stewart; Attorney-General, Francis S. Brown; Superintendent of Education, N. C. Schaeffer; Commissioner of Insurance, J. Denny O'Neill; Secretary of Agriculture, Charles E. Patton—all Republicans except Nathan C. Schaeffer, Democrat.

**JUDICIARY.** Supreme Court: Chief Justice, J. Hay Brown; Associate Justices, S. Leslie Mestrezat, William P. Potter, John Stewart, Robert von Moschziaker, Robert S. Frazer, Emory A. Walling; Clerk, William Pearson.

**STATE LEGISLATURE:**

Socialists .....	..	1	1

**PENNSYLVANIA, UNIVERSITY OF.** A non-sectarian educational institution in Philadelphia, Pa., founded in 1740. Including the summer school, teachers' courses, etc., there were more than 9000 students in all departments in 1916. The faculty numbered approximately 700. During the year Dr. Roswell P. McCrea, dean of the Wharton School of Finance and Commerce since 1912, resigned to become professor of economics at Columbia University. Dr. J. William White, for many years professor in the university, left \$400,000 to it, of which \$150,000 was to be used to endow the J. William White professorship of surgical research. It was announced that eventually, through the receipt of a legacy, the Isaac Ott chair of physiology would be established. A new maternity building for the medical school hospital, costing \$200,000, was erected. The medical school celebrated its 150th anniversary. The productive funds of the university amount to \$3,064,406, and in 1916 it had a total income of \$1,883,056. In the library were over 400,000 catalogued volumes and 50,000 unbound pamphlets. Provost, Edgar Fahs Smith.

**PENNSYLVANIA ACADEMY.** See PAINTING AND SCULPTURE.

**PENNSYLVANIA STATE COLLEGE.** A co-educational State institution at State College, Pa., founded in 1855. In the fall of 1916 there were 3663 students and 293 faculty members. During the year important new heads of departments were appointed as follows: Prof. E. A. Fessenden (mechanical engineering); Prof. S. W. Fletcher (horticulture); Prof. S. Raamussen (dairy husbandry). There were no noteworthy benefactions during the year. The productive funds of the institution in 1916 amounted to \$517,000, and the income, with the exception of that for buildings, was \$817,324. In the library were 60,400 bound volumes and 40,000 pamphlets. President, Edwin Erle Sparks.

**PENNYPACKER, GALUSHA.** An American soldier, died at Philadelphia, Oct. 1, 1916. He was born in Chester County, Pa., in 1844, and was educated at the Phoenixville (Pa.) Classical Institute. Entering the army on April 22, 1861, on an enlistment for three months, he re-entered the service later the same year as a captain in the Ninety-seventh Pennsylvania. He was employed chiefly in the operations along the Atlantic coast until April, 1864. Afterward he was transferred to the Army of the

James and took part in the action at Drury's Bluff (May 13-16, 1864), where he was wounded. Later he commanded a brigade at the capture of Fort Harrison, where he was again wounded, but recovered in time to take part in the final assault on Fort Fisher (Jan. 15, 1865), where his third wound received in the war was so serious that he was confined to a hospital until his resignation from the service in April, 1866. In February, 1865, he was promoted to brigadier-general of volunteers, and was awarded the Congressional Medal of Honor for distinguished bravery in battle. He was brevetted major-general of the United States army in 1867. In 1883 he was placed on the retired list on account of wounds, and in 1904 was made brigadier-general of the United States army, retired.

**PENNYPACKER, SAMUEL WHITAKER.** An American jurist and governor, died at Schwenksville, Pa., Sept. 2, 1916. He was born in 1843 at Phoenixville, Pa. His education was cut short by the death of his father, who was a professor in the Philadelphia College of Medicine, but while teaching school he studied law. In 1866, after serving in the Civil War and finishing the law course at the University of Pennsylvania, he was admitted to the bar. He became early known for his work as an editor of law books, among these being the *Pennsylvania Supreme Court Reports*, known as *Pennypacker's Reports*, in four volumes. In 1889 he was elected a judge of the court of common pleas at Philadelphia, and was reelected 10 years later, having meanwhile become presiding judge. In 1903, however, he gave up his seat on the bench to become Governor, having been elected as a Republican for a four-year term. A cousin of Senator Matthew S. Quay, Governor Pennypacker showed, many believed, that his political acts were influenced by that famous "boss." At any rate, although he was responsible for putting through important legislation, he became best known because the graft scandal connected with the furnishing of the new State capitol was uncovered during his term. His friends claimed that he had no knowledge of what was going on, and at his instance reform measures were passed. Governor Pennypacker, who was deeply interested in colonial history, wrote *Pennsylvania in American History* (1910) and *Pennsylvania, the Keystone, a Short History* (1914), and for many years he was president of the Historical Society of Pennsylvania.

**PENOLOGY.** One of the most significant aspects of modern developments in reform social opinion includes the changes in the attitude of society toward law breakers and their punishment. New theories of criminology emphasize the responsibility of society for the creation of the criminal. The latter, instead of the willful and obstinate offender against the laws of society, is now viewed as a product of social and hereditary factors over which he had no or little control. While this does not remove the necessity of some form of special treatment, it does require that such treatment shall take the form, not of retributive punishment, but rather of reconstitution of the offender by means of education and training which will establish new mental habits and new norms of action. Consequently the new theories of penology lay emphasis upon the individualization of punishment,

the education of the convict in the rudiments of learning, his training in some form of industrial art, and the cultivation of the sense of individual worth and social responsibility. Not only do repeated investigations show that a large proportion, usually the majority, of prisoners are illiterate, but frequently a majority are found to be feeble-minded or insane. Consequently improved methods of prison management require not only the introduction of expert medical attention, but also the employment of an expert in psychiatry.

The tendency toward more frequent and responsible administration was shown in Massachusetts by the abolition of the former prison commission and the creation of a single salaried director of prisons, with an unpaid advisory board. Another widespread movement was illustrated in Illinois in the efforts to abolish county jails and to substitute State penal farms for jails in the treatment of misdemeanants. In Congress the Booher-Hughes bill advocated for a number of years by the National Committee on Prisons and Prison Labor for the control of Federal prisons again failed of final enactment. It has been passed by the House four times and favorably reported by a Senate committee. While its main purpose is to prevent the interstate shipment of convict-made goods it also aims to perfect prison administration by the creation of a national commissioner of prisons to have charge of all phases of the administration of Federal penitentiaries.

THE AMERICAN PRISON ASSOCIATION held its annual meeting at Buffalo in October. Representatives were present from more than 20 institutions and societies which maintained clinics for psychological tests. The psychological study of law-breakers received special emphasis in the discussion, such study being essential to the success of any method of mental or moral reconstruction. One of the most notable addresses was that by Dr. Paul M. Bowers, the medical superintendent of the Indiana State Hospital for Insane Criminals, who held that jurists should study men rather than books. He gave statistics showing that out of 100 criminals 23 per cent were feeble-minded, 10 per cent epileptic, and a large per cent insane. He indicated a direct relation between the crime committed and the mental deficiency in each case. Moreover, for 100 convicts there had been held 108 trials costing the State \$180,000, most of which could have been saved by proper mental tests. Among other topics emphasized was the need of more individualization in the treatment of criminals.

NEW YORK STATE. The year opened with matters at Sing Sing in a somewhat complicated state. Thomas Mott Osborne was under indictment by the grand jury of Westchester County, N. Y., on the charges of perjury and neglect of duty, and at his own request had been granted a leave of absence from the wardenship of Sing Sing; George W. Kirchwey accepted the position temporarily. During the first week in January Governor Whitman demanded the resignation of John B. Riley as State Superintendent of Prisons, and on Mr. Riley's refusal to resign the Governor served charges upon the superintendent and set Tuesday, January 11th, as the day for the hearing. The direct cause for the Governor's act was the order of the State superintendent which di-

rected that 66 prisoners be transferred from Sing Sing to the State prison at Dannemora. Most of these prisoners were prominent as members of the Mutual Welfare League or self-governing body, and their transfer from Sing Sing would have meant a temporary disarrangement of the new order inaugurated by Mr. Osborne. In his note to Mr. Riley, Governor Whitman implied that personal hostility to Mr. Osborne was the motive which actuated the order for the transfer of prisoners. Mr. Riley was succeeded by James M. Carter. Early in March the first of two indictments against Mr. Osborne were dismissed by Justice Thompson of the Supreme Court of Westchester County without giving the case to the jury. The trial on the charges of immorality and mismanagement was set for the last week in March and again Mr. Osborne was cleared, greatly to the satisfaction of the public, which considered that his indictment was a part of a political conspiracy. On July 16th Mr. Osborne returned to Sing Sing as warden, Mr. Kirchwey retiring to make way for him.

During his period of wardenship, Mr. Kirchwey continued the prison reforms inaugurated by Mr. Osborne. Under his administration the dietary of the prison was vastly improved by the combined efforts of Dr. Emily C. Seaman of Teachers College, Columbia University, and the prison food committee. Also a first class medical service was established. The plan for this calls for a medical director who shall devote all his time to the prison; a prison physician and assistant who also shall devote all their time to the work; a staff of visiting specialists from the hospitals and medical schools of New York City; a dentist; a neurologist; a throat and eye specialist; and any others necessary. On August 1st, the psychiatric service under the auspices of the National Committee for Mental Hygiene was put in operation. It receives an appropriation of \$10,000 a year for five years from the Rockefeller Foundation. Dr. Bernard Gleuch, formerly of the Government Hospital for the Insane in Washington, is head of the department. The work of this department will be the examination of each prisoner for mental development, and the classification of all present and incoming prisoners. Finding that fully two-thirds of the prisoners had received no adequate industrial training, Mr. Kirchwey established a school of industrial arts with courses supplementing those in mechanical drawing, telegraphy, stenography, and automobile repairing, already instituted by Mr. Osborne.

Some of the results of Mr. Osborne's work were set forth by the Westchester County Research Bureau. It was shown that the number of prisoners suffering from cuts and stabs received in prison fell from 291 in 1913 and 288 in 1914 to 71 in 1915; the increased attention to health was shown by the increase in the percentage of the average daily prison population treated in hospitals, which rose from 23½ per cent for 1911-12, to 30½ per cent for 1913-14, and to 42 per cent in 1915. The percentage of the population which went insane fell from 2.1 per cent in 1912 and 3.3 per cent in 1913, to 1.8 per cent in 1914 and 1.2 per cent in 1915. In addition to perfecting hospital care, Mr. Osborne reformed the purchasing department by receiving secret bids for supplies instead of giving "political" contracts; and by putting the accounting department on a modern basis. In-

deed, it was said that these changes were the real source of hostility to him. The gross sale of goods made in prison was increased 11 per cent and the profits 100 per cent; while the prisoners were given three meals a day instead of two. Also it was due to Mr. Osborne's agitation that the bill authorizing the building of a new prison on another site to supplant Sing Sing passed the New York Legislature. This new prison will have an entirely different style of architecture.

Mr. Osborne's connection with Sing Sing ended October 16th when his resignation became effective. He accused his superiors of unfriendliness and of interference with his management of the prison. He attacked both Superintendent of Prisons Carter and Governor Whitman. It was said that there was objection to the "practice of featuring convicts and indiscriminate prison advertising"; to the indifference toward escapes of prisoners. While Mr. Osborne objected to orders from above requiring life and long-term prisoners to be confined within the walls of the institution, he himself was accused of tactlessness, moodiness, credulity, and inability to get along with others in authority.

William H. Mayer, ex-warden of the Federal penitentiary at Atlanta, was appointed as Osborne's successor. It seemed doubtful whether under the new administration the experiment in self-government would continue.

**PROBATION.** There is no more important aspect of modern penology than the development of the probation system. This involves social investigation and the combination of social service with the administration of justice; it removes in multitudes of cases the necessity of incarceration and has already enabled thousands of persons to remain at large earning honest livings who otherwise would be in prison. Probation is now provided in some of the courts of 46 States and 2 Territories. In 1916 there were at least 1000 salaried probation officers besides numerous unsalaried ones, and it was estimated that fully 160,000 persons of all ages were on probation during the year.

Separate probation commissions have been established in New York, Massachusetts, and Vermont, with the result that great improvements have been made in the development of standards and uniformity and in the extension of the system to smaller communities. The National Probation Association meets annually, usually in conjunction with the National Conference of Charities and Corrections. In 1916 the officers were: President, Albert J. Sargent, Boston; vice-presidents, Mrs. Benjamin J. West, Memphis, Tenn., John W. Houston, Chicago, and Thomas G. Parris, Philadelphia; secretary-treasurer, Charles L. Chute, Albany, N. Y. The United States Supreme Court has declared that Federal courts have no authority to suspend sentences under existing statutes. Consequently the Owen-Hayden bill was introduced in Congress authorizing Federal courts to suspend sentence and place offenders under the supervision of probation officers. It was expected that this measure would tend to standardize the probation system and stimulate its extension to communities not yet reached by it.

**THE NEW SING SING.** At the close of the year plans were being formulated for the construction of a new State prison of the modern

type with a farm and extensive facilities for industrial training. This was to be located at Wingdale or at Beekman, and it was expected that a large part of the construction work would be done by the prisoners themselves. It was certain that the old-style cell-block type of construction would be abandoned and that a combination of dormitories and single cottages would take its place. It was planned that thereafter Sing Sing should serve as a receiving, analyzing, and distributing station. It would have a staff of experts in physical and psychological measurements and all convicts of the State would be sent there for diagnosis, physical and mental examination, with a view to separating the tubercular, insane, those having contagious diseases, and other special types. These would then be sent for treatment to special hospitals and institutions, while all convicts approximately physically and mentally normal would be sent to the new prisons. These reforms were expected to place the New York prison administration well in advance of the rest of the country.

**Bibliography.** Books and pamphlets published during the year included the following: American Prison Association, *Proceedings, 1915*; Edith Abbott, *One Hundred and One County Jails in Illinois and Why They Ought to be Abolished*; also, *Real Jail Problem*; W. A. Bonger, *Criminality and Economic Conditions*; California State Board of Charities and Corrections, *Study in County Jails in California*; F. M. Sostoevskii, *Crime and Punishment*, tr. by Constance Garnett; Enrico Ferri, *Criminal Sociology*; National Committee on Prisons, *Prisoners as Prison Reformers*; A. S. Oliphant, *Evolution of the Penal System of South Carolina from 1866 to 1916*; T. M. Osborne, *Society and Prisons*; W. H. Wadhams, *New Prison System*.

**PENSIONS.** See OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; UNIVERSITIES AND COLLEGES.

**PENSIONS FOR MOTHERS.** Beginning in 1912 a movement for the enactment of pensions for widows or mothers with minor children swept over the country. This legislation was due in part to child labor laws which had steadily advanced the age at which children might be employed and thus threw various families upon public relief, and in part to a desire to keep young children with their own mothers. As indicated below, the qualifications of recipients varied widely, and much criticism has been advanced against this legislation on the ground that it has been hasty, ill-considered, and likely therefore to result in cultivating a spirit of dependency. Nevertheless, the general principle of State aid in the rearing of children of necessitous families has been overwhelmingly approved by public opinion.

**QUALIFICATIONS OF RECIPIENTS.** Divorced and deserted women were excluded from the benefits of the mothers' pension law by the Washington Legislature because it is alleged that divorce and desertion were thus encouraged. It was nevertheless admitted by social workers that three-fourths of the divorced or deserted mothers in Washington were really worthy of a pension. Moreover, in the 27 other States with mothers' pension laws, it would seem that the terms "parent" or "mother" would be so broadly construed as to include both divorced and deserted women. On the other hand a recent judgment of the Iowa Supreme Court giv-

ing a very strict interpretation, might compel the exclusion of divorced and deserted women in 12 of these 27 States. The following is a synopsis of the qualifications which the various laws require of recipients of pensions: California, widow; Colorado, any parent unable to care for a child but otherwise a proper guardian; Illinois, widow or woman with husband totally incapacitated; Idaho, widow or woman with husband in prison; Iowa, widow or woman with husband in prison or insane asylum; Kansas, widow, divorced mother, or woman whose husband is in prison or insane asylum, totally incapacitated, or has deserted three months; Massachusetts, mother; Michigan, widow, deserted wife, unmarried or divorced mother but otherwise a proper guardian; Minnesota, widow or woman with husband in prison, insane asylum, or totally incapacitated; Missouri, widow or woman with husband in prison or insane asylum; Montana, widow or woman with husband in prison or insane asylum, or unable to work; Nebraska, any parent unable to care for a child but otherwise a proper guardian; Nevada, any parent or grandparent; Nevada, widow or woman whose husband is in prison or insane asylum, is totally incapacitated, or has deserted one year; North Dakota, mother, if a proper guardian; New Hampshire, mother; New Jersey, widow; New York, widow; Ohio, widow or woman with husband in prison or totally incapacitated who has deserted three years, if otherwise a proper guardian; Oklahoma, widow or woman with husband in prison or insane asylum; Oregon, widow or woman with husband in prison, insane asylum, or totally incapacitated; Pennsylvania, widow, or deserted wife; South Dakota, widow, or woman with husband in prison or totally incapacitated; Tennessee, widow, or woman with husband unable physically or mentally to support children, if otherwise a proper guardian; Utah, mother; Washington, widow, or woman with husband in prison or insane asylum, totally incapacitated or has deserted one year; Wisconsin, any parent or guardian; Wyoming, widow, or woman with husband in prison or permanently incapacitated, or has deserted one year, if otherwise a proper guardian. California has given a broad interpretation to its law through its Supreme Court, which practically holds that the mothers' pension fund is as much a public fund as is the public school fund. The average allowance per month for a widow's pension in New York is \$24.77; in Massachusetts, \$24.42; in Cook County, Ill., \$23.28; and in California, \$21.70.

**NEW YORK CITY.** The New York City Board of Child Welfare had far more applicants for widows' pensions than it had funds to provide. Of the 157 allowances granted, the largest was \$60 a month to a mother with seven children, and the smallest \$5.82 a month. In April the Senate passed a bill which amended the widows' pension act by eliminating the charities commissioner of New York and the charities department from the administration of that law.

**MARYLAND.** In the early part of the year Maryland's Legislature passed a mothers' pension bill. An appropriation of \$50,000 was made for distribution among the commissioners of the counties for cost of administration of the pension funds, and the sum of \$10,000 to a board of mothers' relief for a similar purpose in Baltimore.

For a compilation of laws consult W. E. Hannan, *Mothers' Pension Legislation in New York and Other States* (Albany, N. Y., State Library, 1916).

**PEOPLE'S PHILHARMONIC ORCHESTRA.** See MUSIC, *Orchestras*.

**PERAK.** The most northerly state of the Federated Malay States, noted for its tin mines. See FEDERATED MALAY STATES.

**PÉREZ LUJÍN, ALEJANDRO.** See SPANISH LITERATURE.

**PERIM.** A dependency of Aden (q. v.).

**PERISCOPE.** See SUBMARINES.

**PERKIN MEDAL.** See CHEMISTRY, INDUSTRIAL. *Medals*.

**PERSHING, JOHN JOSEPH.** American soldier, prominent in connection with the troubles between the United States and Mexico. In 1916 Pershing was promoted from brigadier-general to major-general. See MEXICO, *History*.

**PERSIA.** A constitutional Asiatic monarchy, hereditary in the Shiite dynasty of the Kajars since 1794; it lies between the Caspian Sea and the Gulf of Oman. Teheran is the capital.

**AREA, POPULATION, ETC.** The area is estimated at 1,645,000 square kilometers (635,135 square miles), and the population at about 9,000,000, of whom about 2,500,000 are nomads. The country is for the most part an arid tableland enclosed on three sides by mountains rising in the north to over 18,000 feet. A salt desert occupies the central and eastern portions. The Karan is the only navigable river. The principal products are cereals, cotton, tobacco, opium, gums, dried fruits, and silk. The country possesses valuable mineral resources, little worked except for the oil fields in the south. The nomads graze herds of sheep and goats and bring a fine grade of wool into the market. The forests are valuable. Carpets, shawls, and silk and cotton fabrics are manufactured.

**COMMERCE AND COMMUNICATIONS.** The total imports in 1914-15 are placed by a British authority at £8,322,030 and the exports at £6,600,960; 1913-14, £11,766,633 and £8,287,993. The chief products for export, together with the imports for consumption, are shown in the table below, with values in the 1913-14 trade in thousands of krans:

Imports	1000 kr.	Exports	1000 kr.
Cottons	201,018	Fruits	70,384
Sugar	170,519	Carpets	53,677
Tea	88,602	Cotton	85,236
Gold and silver bars		Fish	7,886
and coins	14,904	Rice	42,197
Petroleum	10,199	Gold and silver	
Cotton yarn	18,721	coins	16,924
Flour	16,959	Gums	12,924
Woolens	18,416	Opium	87,714
Indigo, etc.	8,782	Wool	12,408
Haberdashery	12,734	Cocoons	13,449
Rice	8,782	Skins	7,984
Spices	5,504	Animals	10,760
Wool	3,891	Silk stuffs	5,573
Animals	2,145	Cottons	2,284
Silks	7,005	Hides	19,656
Tin, zinc, and lead	2,314	Wheat and barley	4,098
		Pearls	1,428

Russia had first place with exports and imports in 1913-14, valued at £5,492,021 and £6,470,693 respectively; Great Britain, £1,038,378 and £3,235,540; Turkey, £870,310 and £406,155; Germany, £53,696 and £552,230; France, £83,440 and £356,891; Austria-Hungary, £13,059 and

£162,210; Belgium, £4079 and £279,855; Afghanistan, £54,025 and £88,834; Italy, £190,428 and £101,783; Oman, £131,034 and £39,397; China, £20,761 and £9715; United States, £185,540 and £4064. Vessels entered (1913-14) at Persian Gulf ports registered 1,998,561 tons, of which 1,523,639 tons British; at Caspian ports 797,850 tons, all Russian. Merchant marine, one sailing vessel of 107 tons net.

The formal opening of Persia's first railway line between Tabriz and Julfa took place May 8th. A regular passenger and freight service on the line was planned and the portion of track opened was a link in the projected railway system which, when completed, would connect Teheran and Persia generally with Europe. Julfa is on the Russo-Persian frontier, and Tabriz, which is about 80 miles south, is an important town in Northern Persia, having been occupied by the Russians, as within their sphere of influence laid down in the Anglo-Russian convention of 1907. The Tabriz-Julfa railway in 1916 was the only real railway in Persia. There was a small line from Teheran to Shah Abdul Azim, a distance of six miles, but it was more a light railway than a regular line.

**FINANCE AND GOVERNMENT.** Under the Anglo-Russian convention, the collection and expenditure of all revenues were placed under supervision of a European treasurer-general. This office, assumed by M. Heynssens Sept. 1, 1914, was resigned by him in April, 1915, upon an attempt to reduce his power to that of a mere clerk; but in March, 1916, he was reappointed and resumed his office. No accurate statement of revenue can be given, as a large part is derived from taxes in kind. The burden of taxation falls heavily upon the lower classes. The expenditure regularly exceeds the receipts. The Russian loan of 1900 is for 22,500,000 rubles; of 1902, 10,000,000 rubles; of 1913, 2,000,000. The British loans of 1910 and 1911, £2,675,181 at 5 per cent; loans of 1912, 1913, and 1914, £490,000 at 7 per cent. Floating debt, 104,870,000 krans; annuities, 14,000,000. The exchange value of the krans is about 8.75 cents. The reduction of customs receipts since the autumn of 1914 has crippled the government so that interest on foreign loans has not been met. Probably £300,000 are overdue the Russian government and £30,000 the British and Indian governments. The reigning monarch is Ahmed Shah Kajar (born 1898); regent Abou'l Kassim Kahn Nasr-el-Mulk left for Europe after the coronation, July 21, 1914; the heir presumptive, Mohammed Hassan Mirza (born 1899), brother of the shah. Of actual government properly so-called there is none. The country is roamed by warring tribes who live by murder and rapine. The caravan routes are infested with brigands. The provincial governors have nominal but no actual control and no power to suppress feuds between tribal factions; the central government remains powerless to help them. Elections to the national council (Mejliss) were held (for the first time since its dissolution in December, 1911) in the summer of 1914.

**HISTORY.** There were complaints of an active campaign on the part of German and Turkish agents to undermine the influence of the Allies. Although Persia had acquiesced in the Anglo-Russian policy of 1907 and had given her adherence to it as late as 1912, it was said that

the country was falling more and more under the influence of the Germans and the Turks, while French influence was inadequately maintained. In France the resumption of the policy for extending French influence in Persia was much discussed. The Russian forces which had entered Persia toward the close of the preceding year continued to advance. A body of them took Sultanabad on January 21st. Another passed along the canal route from Hamadan toward Bagdad. In Western and Central Persia the Russians continued in occupation until July, when the Turks recaptured Kermanshah. The Anglo-Egyptian expedition, under General Sykes, occupied the southeastern corner of the country. The ministry of Prince Firman Firma, which had held office since Dec. 25, 1915, fell from power in March and the Sipah Salar Azam, former premier and war minister, assumed office. For a detailed account of the military operations in Persia, see **WAR OF THE NATIONS**.

**PERU.** A South American republic, bordering the Pacific between Ecuador and Chile.

**AREA, POPULATION, ETC.** The area and the population of Peru are not definitely known. Unsettled boundaries involve many thousand square miles. If certain lines be taken as the probable final boundaries, an estimate of 1,769,804 square kilometers (683,335 square miles) is reached. A 1913 estimate of population was 5,800,000. It is generally believed, however, that 4,500,000 is more nearly correct. Some observers hold that the population is not increasing. Probably more than one-half of the people are Indians; most of the remainder are mestizos. The estimated population of Lima is about 150,000; Arequipa, 35,000 to 40,000; Callao, 35,000; Cuzco, 30,000 (very likely too high an estimate); Ayacucho and Iquitos, each 20,000. The population of the Amazon port, Iquitos, varies much with the season, from perhaps 30,000 during the high-water period to 18,000, or even to 12,000, in the dry season, when the rubber gatherers are out.

Elementary instruction is nominally but not actually compulsory, and illiteracy prevails throughout the country. There are about 2250 public primary schools, with an enrollment of about 150,000 pupils. The government maintains 27 "colleges," and there are a few other secondary schools and private schools of various grades, and several institutions for special instruction. The old University of San Marcos at Lima has faculties of law, medicine, theology, philosophy and letters, mathematics and science, and political and administrative science. There are also universities at Cuzco, Arequipa, and Trujillo. The state religion is Roman Catholicism.

**PRODUCTION AND COMMERCE.** The most important crops commercially are sugar cane and cotton. Rubber, gathered in large quantities in the northeastern districts, is one of the chief exports, being shipped down the Amazon from Iquitos. Other important products are coffee, rice, corn, wheat, cacao, tobacco, and coca. Sugar production in 1914, 228,055 tons; in 1915, 262,841 tons. Cotton production in 1912, 375,651 quintals (of 101.4 pounds); in 1913, 523,456; in 1914, 487,065. The production of alcohol amounted to 10,961,055 litres in 1914 and 10,121,005 litres in 1915. Alpaca, sheep, and llama wool are exported. Peru has rich mineral deposits, which have been its principal source

of wealth. The chief metals mined are copper and silver. The copper output in 1915 is reported at 32,410 tons. Other minerals exploited to some extent are gold, coal, lead, and petroleum. Petroleum output in 1914, 252,666 tons.

Imports and exports have been valued as follows, in libras (the Peruvian libra is equivalent to the pound sterling, or \$4.86656):

	1911	1912	1913	1914	1915
<b>Imports:</b>					
	5,488,247	5,157,686	6,088,777	4,827,930	3,095,545
<b>Exports:</b>					
	7,416,028	9,488,581	9,137,780	8,767,790	14,123,071

Leading imports in 1913 and 1914 respectively: cotton, woolen, and silk goods, £664,601 and £580,460; timber, £312,724 and £314,009; coal, £301,321; wheat, £256,319 and £212,004. Principal exports in 1913 and 1914: sugar, £1,412,660 and £2,640,952; cotton, £1,564,844 and £1,515,742; copper, £1,682,686 and £1,430,360; petroleum, £910,227 and £888,672; rubber, £815,824 and £447,792.

Imports and exports by principal countries, in thousands of libras:

	Imports		Exports	
	1913	1914	1913	1914

<b>Total .....</b>	<b>6,089</b>	<b>4,828</b>	<b>9,138</b>	<b>8,768</b>

**COMMUNICATIONS.** The following information concerning Peruvian railways is taken from a monograph published by the Pan-American Union in 1916:

"The railways in operation in the republic have an extent of 2766 kilometers (1718 miles), of which 2092 kilometers (1300 miles) are standard and the rest narrow gauge. In this mileage is included 45 kilometers (30 miles) of interurban electric lines, all standard gauge. There are also about 5500 kilometers (3418 miles) of line being constructed and under survey.

"The Peruvian railways are to a great extent owned by the government, and some 1800 kilometers (1120 miles) or 65 per cent of these lines are operated by the Peruvian Corporation (Ltd.), under arrangements made with that corporation. The Peruvian Corporation (Ltd.) also owns and operates a line of steamers on Lake Titicaca, the highest navigated body of water in the world, and by the purchase in 1910 of the Guaqui-La Paz Railroad in Bolivia it established a through route between Mollendo, on the Pacific coast, and the Bolivian capital. . . .

"The Central Railway is the most important line in the country, running from Callao through Lima, the capital, to Oroya, over 140 miles (225 kilometers) of track, with an extension from the later point to Huancayo, 78 miles (126 kilometers) farther. The Cerro de Pasco Railway . . . runs from Oroya to Cerro de Pasco, the location of the largest copper mines in the world, situated at an altitude of 12,178 feet

(3712 meters) above sea level. The Central Railway is remarkable from the fact that on its short branch to Morococha the line reaches a height of 15,866 feet (4835 meters), the highest point of any railroad now in operation in the world.

"Second in importance is the Southern Railway, extending from Mollendo to Puno, on Lake Titicaca, a distance of 324 miles (521 kilometers), from which latter point it connects with a line of steamers running to the Bolivian port of Guaqui. From Juliaca, near the shore of the lake, a branch extends to Sicuani and Cuzco. On the Southern Railway, at a distance of 172 kilometers (107 miles) from the coast, is situated the city of Arequipa, which stands at the foot of the far-famed mountain, El Misti. Near Arequipa also is located the Harvard Observatory, which was established at this particular point on account of the clearness of the atmosphere. Arequipa is 7600 feet (2316 meters) above sea level, and the line reaches its highest altitude of 14,866 feet (4470 meters) at Crucero Alto, within a few hours' travel of that city. A remarkable fact in connection with the Southern as well as the Central Railway is that both lines arrive at their high altitudes without the assistance of the rack-rail system, which has generally been found necessary on similar railroads."

According to the above-mentioned monograph, Peru has 340 telegraph offices, with about 10,500 miles of line, and about 800 post offices. There is a radiotelegraph system.

**FINANCE.** The standard of value is gold. The monetary unit is the libra (pound), equivalent to the pound sterling, its par value being \$4.86656. Often the sol is used as the unit of value; 10 soles equal one libra. Revenue and expenditure in 1913 and 1914 and budget estimates for 1915 and 1916 were reported as follows, in libras:

	1913	1914	1915	1916
Rev. ....	3,417,974	2,921,498	2,847,275	2,686,950
Exp. ....	3,318,896	3,015,464	2,978,479	2,920,159

Estimated receipts from customs in 1915, £971,534; taxes, £793,619; monopolies, £820,034. Estimated disbursements in 1915, by departments: finance and commerce, £997,172; war and marine, £724,191; justice and public instruction, £480,761; administration, £476,733; public works, £143,634; congress, £97,941; foreign affairs, £53,047. The total public debt at the end of 1915 is reported at £8,589,679, the internal debt amounting to £702,648, and the floating debt to £1,917,637.

**GOVERNMENT.** The executive power is vested in a president, who is constitutionally elected by direct vote for four years and is ineligible for the next term. He is assisted by a cabinet of six members, appointed by him and responsible to the congress. Two vice-presidents are elected, also for four years, to succeed, in order, to the executive power in case of the president's death or disability. The legislative power is exercised by a congress of two houses, the Senate and the House of Representatives. Senators (52 in number) and representatives (116) are elected by direct vote for six years. The president in 1916 was José Pardo. He was inaugurated Aug. 13, 1915, for the four-year term; on the 10th of that month he was elected

by the congress to succeed the provisional president, Col. Oscar R. Benavides.

Congress, despite the president's non-approval, promulgated a constitutional amendment that granted religious liberty.

The European war adversely affected both Peru and Bolivia, and as a consequence the traffic on the various transportation lines operated by the Peruvian Corporation was seriously diminished during the year ended June 30, 1915. There was a decrease of \$1,194,311 in income as compared with the year ended June 30, 1914. The traffic lines operated by the Peruvian Corporation were as follows: The Central Railway, which includes the Morococha branch and the Oroya-Huancayo extension; the Southern Railway, including the Cuzco extension; the Guaquí-La Paz Railway; the steamers on Lake Titicaca and River Desaguadero; the Ilo-Moquegua Railway; the Trujillo Railway; Paita to Piura Railway; the Pacasmayo and Guadalupe Railway (including the extension to Chilite); the Chimbote Railway; and the Pisco to Ica Railway. It also maintains and administers the Chira Canal. The temporary arrangement with the Peruvian government for the working of the Ilo-Moquegua Railway was terminated in 1915, the line being taken over by the government.

**PETAÏN, HENRI PHILIPPI.** See WAR OF THE NATIONS.

**PETROGAR.** This is a laxative compound made up of two popular purgatives, petrolatum and agar. Each 100 parts contains 72 parts of petrolatum and 22 of agar, with powdered licorice, cocoa, and oil of anise sufficient to flavor.

**PETROLEUM.** Measured by marketed products the year 1915 was the greatest in the history of the crude petroleum industry in the United States. There were produced 281,104,104 barrels, compared with 265,762,535 barrels in 1914, which was at that time the record production. The most significant change in the rank among the oil producing States was that for Oklahoma and California, the former superseding the later for first place by a margin of more than 11,000,000 barrels. Next in importance was the advance of Texas from fourth place in 1914 to third in 1915, by exchange with Illinois. Pennsylvania advanced to seventh place, and Ohio to eighth. The following table gives the production of petroleum in 1914-15 by States in accordance with petroleum marketed:

PETROLEUM MARKETED IN THE UNITED STATES AND AVERAGE PRICE PER BARREL IN 1915

State	1915		Average price per barrel
	Quantity (barrels)	Value	
Alaska	(a)	(a)	.....
California	86,591,535	\$36,558,439	\$0.422
Colorado	208,475	188,485	.880
Illinois	19,041,695	18,655,850	.980
Indiana	875,758	818,895	.929
Kansas	2,828,487	1,702,891	.603
Kentucky	437,274	418,857	.957
Louisiana	18,191,539	10,804,658	.594
Michigan	(a)	(a)	.....
Missouri	(a)	(a)	.....
New York	887,778	1,890,325	1.566
Ohio	7,825,326	10,061,493	1.286
Oklahoma	97,915,243	56,706,133	.579
Pennsylvania	7,898,705	12,431,353	1.586
Texas	24,942,701	18,026,925	.522
West Virginia	9,264,798	14,468,278	1.561

State	1915		Average price per barrel
	Quantity (barrels)	Value	
Wyoming	4,245,525	2,217,018	.522
Other states	b 14,265	b 24,295	1.708
	281,104,104	179,462,890	.638

a Included in "Other states." b Includes Alaska, Michigan and Missouri.

Again in 1916 all previous records for production were exceeded in the petroleum industry of the United States. The United State Geological Survey estimated that during the year 292,300,000 barrels of crude petroleum were produced and marketed in the oil fields of the United States, a quantity greater by 11,000,000 barrels, or 4 per cent, than the output in 1915. In addition to the quantity of oil produced and marketed in 1916, several million barrels were produced and placed in temporary field storage in Kansas and Oklahoma.

The accompanying table shows, by States, the estimate of the production in 1916 in barrels of 42 gallons each:

ESTIMATED UNITED STATES PETROLEUM PRODUCTION, 1916

State	Quantity Barrels
Oklahoma	105,000,000
California	89,000,000
Texas	26,000,000
Illinois	16,500,000
Louisiana	15,800,000
West Virginia	8,500,000
Pennsylvania	8,000,000
Ohio	7,400,000
Kansas	6,500,000
Wyoming-Mont.	6,800,000
Kentucky	1,200,000
Indiana	1,000,000
New York	900,000
Colorado	190,000
Other States	10,000
	292,300,000

The increased production in 1916 was explained by the continued ability of recently developed fields in the mid-continent and Rocky Mountain regions to supply enough oil from new wells to more than offset the normal decline in the older fields east of the Mississippi, as well as by the active development which, especially in Oklahoma, Kansas, and Texas, was remarkably successful. The chief centres of increased production in 1916 were in Estill and Allen counties, Ky., Butler County, Kan., Carter County, Okla., and Converse, Park, and Natrona counties, Wyo.

The incentives that caused the increase in 1916 were chiefly higher prices for oil, which encouraged more drilling than in many years, especially in Kansas, Oklahoma, Texas, and Wyoming, and not infrequently at points far removed from previous developments. There was a decrease in production in the Cushing pool, Okla., which, from over 300,000 barrels a day in 1915, declined to 60,000 barrels a day in 1916. This, however, allowed the product of other mid-continent fields access to markets then being developed with connections direct to both the Lake cities and the Atlantic seaboard. There was also a greatly increased demand for crude oil.

In 1916 there were 302 oil refineries in the

United States, having a total daily capacity of more than 1,000,000 barrels. This exceeded the daily crude petroleum production, but during 1914 and 1915, a time of overproduction and low prices, many refineries were completed. The Standard Oil controls but slightly less than 50 per cent of the total refining capacity, or approximately 495,000 barrels, and was building several additional refining plants.

The total number of refineries was made up of 28 idle and 11 in course of construction, and 265 plants in active operation. California had 76 refineries of which 19 were idle and 57 active. The total investment in oil refineries in the United State was put at \$425,000,000.

With about 40 new refining plants projected the daily refining capacity of the United States will be increased to nearly 1,200,000 barrels per day when in maximum operation.

The year 1915 was one of notable expansion in the domestic market for petroleum fuel. The continued over-production of crude oil in Oklahoma supplementing, by the increased output of refinery residuums provided, the surplus of fuel grades of petroleum, supplied by the Gulf coast fields, resulted in a confidence in the future supply and a current market price of greatly stimulated fuel oil consumption. This was particularly notable in the Southwest, where railroad and industrial plants of all types adjacent to the source of supply adopted it to the exclusion of coal. Owing to the conditions of ocean transportation by the United States and foreign ports the number of tankers available for service between the United States and Mexico was increasing, with the result that imports of fuel oil from that country showed a decided increase in 1915.

**PRICES OF CRUDE OIL.** Notwithstanding the increased production, the prices of crude petroleum at the wells were higher in 1916 than in 1915. From the beginning of 1916 the market continued to advance until March, when a period of relative stability was attained. Pennsylvania grade advanced from \$2.25 to \$2.60 a barrel and Oklahoma-Kansas grade from \$1.20 to \$1.55 a barrel, with a premium of 50 to 60 cents for the product of the Cushing pool. The high prices were maintained until the middle of July, when a general retrogression in prices took place which lasted until the curtailment of production in certain newer fields prevented further reduction, and later there was an advancing market which put the prices for such typical grades as Pennsylvania at \$2.85 and Oklahoma-Kansas at \$1.40 a barrel.

The use of petroleum for fuel along the Atlantic seaboard is rapidly and steadily increasing. In New England it is coming to quite general use in the large textile and paper mills, in small industries, and even in domestic heating plants. The use of petroleum on American merchant ships, especially in the Pacific, is almost general. Complete statistics of the consumption of fuel oil in the United States are not available, but estimates indicate that about 48,860,000 barrels of domestic crude oil were delivered for fuel purposes in 1915. In addition more than 16,000,000 barrels were imported from Mexico. There was a decided increase in the consumption by railroads. The consumption of fuel oil by the United States navy during the fiscal year ending June 30, 1916, was approximately 47,000,000 gallons. For Rittman Proc-

ess, see **CHEMISTRY, INDUSTRIAL.** See also **GEOLOGY.**

In 1916 the gasoline situation was of unusual interest, for with the higher prices for oil the prices for gasoline increased and from a wholesale price of 21 cents a gallon on Jan. 1st, there was a progressive advance to 24 cents on March 24th, which was maintained until August, when a decline began that reached 22 cents on September 5th. With the retail price to the consumer about six cents in excess of these figures, the interest of over 2,250,000 motor car owners in the United States in gasoline production may be appreciated and the possibilities of a gasoline famine were discussed. In 1916, in addition to the usual methods of refining, some 5,000,000 barrels of gasoline were being made by the "cracking" process as compared with about 2,000,000 barrels in 1915, and this from grades of oil that never previously entered into the manufacture of gasoline. There was an increased production of so-called blended gasoline where casing-head gasoline, a volatile product obtained from natural gas, was being blended with oil just a little lighter than kerosene.

**WORLD'S PRODUCTION.** The following table shows the world's production of petroleum in 1915 in so far as statistics are available:

**WORLD'S PRODUCTION OF CRUDE PETROLEUM IN 1915**

Country	Production 1915		Percent- age of total
	Barrels of 42 gallons	Metric tons	
United States . . . . .	a 281,104,104	a 37,480,547	65.78
Russia . . . . .	68,548,062	9,358,077	16.09
Mexico . . . . .	82,910,508	4,388,068	7.69
Dutch East Indies b	12,886,808	1,710,445	2.90
Rumania . . . . .	12,029,913	1,673,145	3.81
India . . . . .	8,202,674	1,093,690	1.92
Galicia . . . . .	4,158,899	578,888	.97

**PHILADELPHIA SYMPHONY ORCHESTRA.** See **MUSIC, sections Orchestras and Novelties.**

**PHILIPP, EMANUEL L.** Relected Republican Governor of Wisconsin, Nov. 7, 1916. See **WISCONSIN.**

**PHILIPPINES. AREA AND POPULATION.** The total area of the islands is 115,026 square miles. The estimated population in 1916 was 8,834,187. The last census of the Philippines was taken in 1903, when the population was 8,265,348.

**AGRICULTURE.** Agriculture, the basis of all Philippine wealth, is the department in which the American government has made the least progress. In some parts of the islands agriculture has never recovered from the destructive effects of the wars of insurrection against Spain and the United States. In former days the Philippines

were actually exporters of rice, while now from 12,000,000 to 15,000,000 pesos go out of the country every year, for rice is the staple article of food. Efforts have been made to educate the Filipinos into making more diversified crop production, and this has had some success. The Bureau of Agriculture has been active in the endeavor to bring about reforms in seed selection, irrigation, and fertilization. The chief hindrance to profitable development of the agricultural lands of the islands has been the ravages of the rinder pest and the locust, and although progress has been made, these problems still remain to be solved.

Under the stimulus of the Bureau of Agriculture is the formation of coöperative agricultural societies of which there are now 29 provincial and 295 municipal organizations. In 1914-15 laws were passed for the formation of rural credit associations, for the founding of a government bank with special grade facilities for agriculturists, for the reform of irrigation and water right laws, for the rapid building and extension of the road system, for the grading and classifying of hemp for exports, for the regulation and betterment of the export of cigars to the United States, for improvement in the locust and rinder pest, and for the organization and operation of government aid of sugar and copra centrals. An agricultural colony has been established in Mindanao, Momungan, and gives promise of success. The chief agricultural products of the island are sugar, hemp, copra, tobacco, and rice. The value of these is indicated in the section on commerce below.

**COMMERCE.** The total shipments to the United States from the Philippines in the 11 months ending Nov. 30, 1916, amounted to \$31,443,169, compared with \$20,612,619 for the corresponding period in 1915. The shipments from the United States to the Philippines amounted to \$20,535,379, compared with \$24,885,849 in 1915. The productions of chief value exported to the United States were fibers, including vegetable and textile grasses, valued at \$13,838,501, sugar, valued at \$7,270,956, tobacco, valued at \$1,749,592, fruits and nuts, \$2,004,701, vegetable oil, \$3,117,617. Other exports of some value were chemicals and drugs and hats.

The foreign trade department of the National City Bank of New York City during the year prepared an interesting compilation showing the total trade of the United States with the Philippine Islands during the 16 years which they have been under American control, compared with the 16 years immediately preceding. It is shown that the total exports from the United States to the islands under American control aggregates \$201,000,000, compared with a little over \$2,000,000 in the 16 years preceding annexation. Before annexation the islands seldom exported to the United States products of more than \$200,000 of value per year. In the year following annexation exports amounted to \$2,500,000, and steadily increased until during the last few years they have averaged \$25,000,000, and in 1914 were over \$27,000,000. Imports from the islands, which averaged less than \$5,000,000 per year preceding its annexation, have averaged, since annexation, about \$25,000,000. The total imports from the islands in the 16 years since annexation were \$218,000,000, compared with \$121,000,000 in the 16 years preceding. In the five years immediately preceding

annexation the average was about \$4,500,000 per year. The total exports in 1899 were \$14,847,000, and in 1914, \$48,690,000, while in 1899 the total imports were \$19,193,000, and in 1914, \$48,589,000. In 1899, the year immediately preceding annexation, the total foreign trade of the islands was \$34,000,000. Since annexation the average has been about \$100,000,000. Prior to annexation the United States supplied about 1 per cent of the goods imported by the islands. In 1915 slightly more than 50 per cent were exported from the United States, which took over 40 per cent of their imports. During the 16-year period the Philippines have become the largest cotton goods market of the United States. Other important exports include iron and steel, manufactures, breadstuffs, cars and carriages, leather and manufactures of leather, mineral oils, paper and manufactures of paper, meat and dairy products, and india rubber manufactures. The chief exports are manila hemp, sugar, cocoanut oil, copra, and cigars and cigarettes.

**EDUCATION.** The total number of schools in the islands in December, 1915, was 4386, compared with 4187 in the previous year, and 4235 in 1913. The average daily attendance increased from 428,552 in 1913 to 473,213 in 1915. In the Philippines a large portion of the total number of pupils is in the primary schools, but the intermediate or secondary schools have also made a striking increase in recent years due in part to private subscriptions to the school funds. A large share is played by athletics in the school curriculum, and this is proving of great benefit to the Filipino people. The participation of the Filipino athletic team in the second meet of the Far Eastern Athletic Association in Shanghai in May, 1915, was an unqualified success. In the contest with the Chinese and Japanese athletes the Filipinos won a majority of the field and track events. Education among the non-Christians of the islands is greatly on the increase. Since 1914 the appropriations have practically developed and the first act passed by the Legislature in the session of 1915-16 was the setting aside of 1,000,000 pesos for new primary school work among the non-Christians. In this class of education particular importance is attached to industrial or technical studies, and less time is devoted to the purely academic. The school enrollment in the Mountain Province in 1915 nearly doubled, and in the departments of Mindanao and Sulu still more striking progress was made. In these departments among the Mohammedan and pagan populations, the greatest activity was noticeable in the opening of new schools, for which there is a genuine demand among the people. There were 273 teachers engaged in the work in 1915. Of these only 14 were Americans. The insular appropriations for schools in 1915 was 4,259,000 pesos, while 725,000 pesos were contributed to the university, and 731,189 pesos were spent in the construction of new school buildings. The University of the Philippines is progressing rapidly to a position of importance and influence in Far Eastern affairs. The enrollment is about 2000.

**FINANCE.** The report of the treasury showed a balance on hand on Dec. 31, 1914, of 13,385,908 pesos. The receipts from all sources for the fiscal year amounted to 130,851,977 pesos, and the expenditures to 118,104,269 pesos, leav-

ing a balance at the end of the year of 12,747,707 pesos.

**BANKS AND BANKING.** The amount loaned by the agricultural bank during 1915 was 1,221,570 pesos. The number of applications was 441, and the number of loans made was 247. The total resources of the commercial banks in 1915 were 71,542,868 pesos.

**HEALTH AND SANITATION.** By an act of the Legislature the former Bureau of Health Office in 1915 was changed to the Philippine Health Service. A council of hygiene was created with advisory functions, by which the health service is brought into closer consultation with the representatives of the people. There is an undoubted improvement in the general attitude of the people toward sanitation, and the much needed efforts of sanitary work in the provinces has been systematically entered upon. While Manila has heretofore been brought to the position of a model city as far as sanitation and health are concerned, the extension of serious efforts to improve sanitary conditions in the provinces is now being instituted. Generally speaking the Philippines were free from communicable diseases during 1915.

One of the accomplishments, during the year, of science and humanity was the determination to discharge from the Culion leper colony on August 28th, 23 clinically and bacteriologically negative lepers who had been medically treated there.

**CONSTABULARY.** The Philippine Constabulary maintained its high level of organization and efficiency during 1915. On Dec. 31, 1915, there were 341 officers of whom 223 were Americans and 118 Filipinos, and 4981 enlisted men, all Filipinos, in the constabulary.

**PUBLIC WORKS.** A large programme of public works was carried out in 1915. The total expenditures for this purpose amounted to 11,281,282 pesos, an increase of 13 per cent over 1914, including an increase of 108 per cent on port works, and 40 per cent on water supply. At the end of the year there were 3068 kilometers of first class road in the islands, an increase of 20 per cent over 1914, 2082 of second class, and 3052 of third class, making a total of 8002 kilometers. During the year a new concrete wharf was constructed at Iloilo, Manila.

**CHARITIES AND CORRECTIONS.** A prisoners' court was established at Bilibid prison for the trial of offenses against prison regulation and discipline. All the members of the court are prisoners, and of the 2000 cases determined by them the director of the prison modified only 5 per cent. The Iwahig penal colony so increased its food products during the year as to reduce the cost of rations. A new record was also made in that for the first time there were no escapes from the colony, and no serious injuries from violence.

**RAILWAYS.** The report of the operation of the Philippine Railway Company's lines in the Philippine Islands for the year ended Dec. 31, 1915, showed a total revenue of \$362,407 as against \$361,219 in 1914. Total expenses for 1915 were \$243,035, against \$232,705 in the previous year. The net operating revenue was \$119,372, as compared with \$128,424 in 1914, a decrease of 7.05 per cent for 1915.

The Manila Railroad was sold to the Philippine government for \$4,000,000 and the sale was ratified on Sep. 8, 1916. This line, which is

the only one on the Island of Luzon, has 350 miles of track.

**POLITICS AND GOVERNMENT.** The most notable incident relating to the Philippines during the year was the enactment by Congress of a new Organic act which was approved by President Wilson on Aug. 9, 1916. An account of the passage of this bill through Congress follows.

In the 63rd Congress in 1915 there was introduced in the House of Representatives what was known as the Jones bill, prepared under the leadership of Chairman Jones of the House Committee on Insular Affairs. The expressed object of the bill was to increase self-government in the islands, but in the preamble there was stated the intention of the United States to give the islands independence at some unnamed date in the near future. In the 64th Congress this bill, somewhat revised by the Senate, was reintroduced. For the most part it was a very elaborate code of fundamental provisions, resembling to some extent the State constitutions. The bill passed the House and in the Senate was amended, among other details, by a provision or by a section providing for the immediate evacuation and abandonment of the Philippines. This amendment was offered by Senator Clarke of Arkansas, and after an extended debate was adopted. The clause provided for the withdrawal of the American government from the islands within two years after the enactment of the bill, although the period may be extended by the President for two years longer if he deems it necessary. In spite of this expressed determination to abandon the islands within so brief a time the remainder of the bill is devoted to the formulation of an elaborate system of government, which could not be perfected within the period named for withdrawal. Mr. Garrison, at the time Secretary of War, protested strongly against the bill, calling the Clarke amendment "an abandonment of the duty of this nation and a breach of trust toward the Filipinos." President Wilson, replying, admitted that in his judgment the Clarke amendment was unwise at this time. He continued, however, "It would clearly be called indefensible for him to take a position that he must dissent from that action should both Houses of Congress concur in a bill embodying that amendment. That is a matter upon which I must withhold judgment until the joint action of the two houses reaches me in definite form. What the final action of the two houses will be no one at this time can certainly forecast."

The vote in the Senate on the Clarke amendment was a tie, but was decided by the vote of Vice-President Marshall. Upon the final vote as a whole, including the Clarke amendment, the measure passed with 52 affirmative and only 24 negative votes. Five Republicans voted with the Democrats. These were Borah, Kenyon, La Follette, Norris, and Works.

In the House of Representatives strong opposition developed to the promise of independence at a definite time. The Clarke amendment, which would have decreed the withdrawal of the United States from the islands within four years and which had passed the Senate, was defeated in the House by a vote of 113 to a vote of 165. Thirty Democrats joined the Republican minority in voting against the amendment. Two attempts to retain the provision in a modified form were defeated. The first of these set the

time from two to six years, the second a minimum of four years and a maximum of eight years. Having defeated these amendments the House then voted to substitute for the measure as it came from the Senate the Jones bill, which merely declared in its preamble that it had always been the intention of the United States to grant freedom to the Philippines. The bill was then sent to conference and House conferees were instructed to agree to no declaration in the bill setting a definite time for giving freedom to the Filipinos. The bill was finally agreed upon, and became a law on Aug. 29, 1916.

The first Philippine Congress consisting of a Senate and House of Representatives, created by the bill passed by the 64th Congress, convened in Manila on October 16th. For the first time in the history of the islands the non-Christian tribes were represented in the legislative branch of the government. Governor Harrison confirmed the appointments to the Senate of a Senator representing the Moro Province, and another representing the Mountain Province.

A measure passed at the 1916 session of the Insular Legislature permitted government employees, after a certain term of service, to retire with a full year's pay. This measure, together with the growing uncertainty of American office holders as to their tenure of office, in view of the policy of the government to advance Filipinos to high offices led to a number of resignations. Harry F. Edwards, for 15 years Director of Agriculture, resigned, and Andriano Hernandez, Assistant Director, was promoted to take his place. He is the first Filipino to hold an administrative office of such rank. Stephen Bonsol also resigned as member of the Board of Utility Commissioners, and the vacancy was filled by a native. A still more interesting promotion was that of Joaquin de Luna to the governorship of the Mountain Province, inhabited by the Igorrotes and other semi-savage tribes. Under Governor Luna several American sub-governors are serving.

On January 20th the Department of Commerce announced that the Coast and Geodetic Survey and Bureau of Lighthouses had recently surveyed and marked a safe passage through the Sulu Sea, a body of water covering over 50,000 square miles extending from the southeast corner of Palawan to the northeastern corner of Mindanao, and from the northeast corner of Borneo to the southwestern extremity of Panay. Heretofore over this great area there had been little known of the great depths and isolated sand cays, and coral reefs, except for a few scattered soundings and markings made by early navigators, which were of little practical use in the navigation of modern steamships.

**STATE OFFICERS.** The Governor-General in 1916 was Francis Burton Harrison.

**PHILLIPOTS, EDEN.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, English.

**PHILOLOGY, CLASSICAL.** In 1916, far more even than in 1915, American students of classical matters were cut off from access to foreign publications in their fields, especially books and periodicals published within the domains of the Central Powers. For many months it has been impossible for an individual to import books or periodicals from these domains. Of necessity, therefore, this article will be confined almost wholly to American and English work in classical philology.

To the *Loeb Classical Library* (see YEAR BOOKS for 1911, 1912, 1913, 1914, 1915) were added, on the Greek side, translations of the *Greek Anthology* (the first of five volumes), by W. R. Paton; Marcus Aurelius Antoninus, *Meditations and Speeches*, by C. R. Haines; of Dio Cassius (the fourth of nine volumes), by E. Cary; of Galen, *On the Natural Faculties*, by A. J. Brock; of Lucian (the second of seven volumes), by A. M. Harmon; of Plutarch (the third and fourth of 10 volumes), by B. Perrin; of Procopius (the second of six volumes), by H. B. Dewing; of Theophrastus, *Enquiry into Plants and Minor Works on Odours and Weather Signs* (two volumes), by Sir A. Hort; and, in one volume, Longus's romance, *Daphnis and Chloe* (by S. Gaselee) and Parthenius's *Love Romances* (G. Thornley's translation, revised by J. M. Edmonds). On the Latin side there were added Plautus (the first of four volumes), by P. Nixon; Ovid, *Metamorphoses* (two volumes), by F. J. Miller; Vergil (the first of two volumes), by H. R. Fairclough. There have been many translations of Greek and Latin writings as individual efforts, not parts of such a coordinated series as the *Loeb Classical Library*. But for these, important as they often are, there is no space to list here.

Parts I and II of Volume 11 of the *University of Michigan Studies, Humanistic Series*, contained important works by American scholars, of the University of Michigan, the one a mathematician, the other a classical scholar. The former, by L. C. Karpinski, was an edition of *Robert of Chester's Latin Translation of the Algebra of Al-Khwarizmi*; it contained the Latin text, an English version of the text, Introduction and Critical Notes. A review of the book by D. E. Smith, a mathematician, in *Science*, March 17, 1916, and another by M. W. Humphreys, a distinguished classical scholar possessed also of marked mathematical genius and knowledge, in *American Journal of Philology*, xxxvii, 354-357, give a good idea of the importance in the history of science of the original work. The other work, by J. G. Winter, is an English version, accompanied by an Introduction and Explanatory Notes, of *Nicolaus Steno's Dissertation Concerning a Solid Body enclosed by Process of Nature within a Solid*.

In the United States four periodicals deal with classical matters only. Two of these, the *American Journal of Philology* and *Classical Philology*, make appeal primarily to scholars; they are repositories of articles embodying the results of original research. The others, the *Classical Journal* and the *Classical Weekly*, are concerned primarily with the presentation of the value of the classics, and with the pedagogy of the subject. But both contain articles informational in character, embodying, too, at times, some measure of original research. The reviews in the *Classical Weekly* are particularly valuable; these are often real contributions to the subjects involved in the books under review.

In vol. xxxvii of the *American Journal of Philology* were published "The Latest Expansions of the *Iliad*," G. M. Bolling (an effort to determine, on the basis of our manuscripts and the papyri, the earliest form, uninterpolated, of the text of the *Iliad* now accessible to us); "The Latin Grammarians of the Empire," W. M. Lindsay (some observations on the writings grouped in the seven volumes of H. Keil's well

known work, *Grammatici Latini*); "A with the Future," H. N. Sanders; "Pro Domo Mea," E. W. Fay (etymological investigations); "Later Echoes of Calpurnius and Nemesianus" (Roman writers of pastoral poetry), W. P. Mustard; "Notes on Tibullus," K. F. Smith (supplementary to his edition of *Tibullus*, noted in the YEAR BOOK for 1913); "Mimnermus and Propertius," D. B. Durham (the article challenges Wilamowitz' view that Mimnermus was an important source of the Cynthia book of Propertius' *Elegies*); "The Origin of the Indo-European Nominal Stem-Suffixes," W. Peterson; "Cæsar B. G., III, 12, 1,—A Review and an Interpretation," S. G. Oliphant (an interesting discussion of the passage, long debated, in which Cæsar, while describing his naval operations against the Veneti in Northwestern Gaul, makes a puzzling allusion to the tides); "A Point in the Interpretation of the Antigone of Sophocles," C. Knapp (the author, by calling attention to a recurrent "Think, think," "Be wise" motif, seeks to support the view that the poet held Antigone entirely guiltless); "The Personality of the Epicurean Gods," G. D. Hadzaitis; "Molle atque Facetum," M. B. Ogle (an interpretation of the famous phrase used by Horace, *Satires* i.10.40, of Vergil's *Eclogues*: the author attacks the explanation of the phrase advanced, in an elaborate article in *Harvard Studies*, xxv, by C. N. Jackson); "The Greek Article in First and Second Century Papyri," F. Eakin; "The Article before the Genitive of the Father's Name in Greek," C. W. E. Miller (now Assistant Editor of the *American Journal of Philology*); "The Semantics of Latin Adjective Terminations," E. W. Nichols (a discussion of Latin adjectives from the point of view of relation between stem and termination); "The Latest Expansions of the *Odyssey*," G. M. Bolling; "The Suffix *μα* in Aristophanes," C. W. Peppler. Reviews of special importance in this volume are those of J. E. Sandys, *The Odes of Pindar* (part of the *Loeb Classical Library*) and of J. H. Rendel, *The Origin of the Cult of Artemis*, both by B. L. Gildersleeve, editor of the *American Journal of Philology*; W. Leaf, *Homer and History*, by F. G. Allinson; M. Clerc, *Aquæ Sextiæ: Histoire d'Aix-en-Provence dans l'antiquité*, by R. V. D. Magoffin; C. Pascal, *Poeti e Personaggi Catulliani*, by B. L. Ullman. In the department known as "Brief Mention," Professor Gildersleeve wrote on a wide variety of topics. Finally, there were useful summaries of the contents of several foreign classical periodicals: of *Hermes*, xlvi-xlvii, by H. L. Ebeling; of *Glotta*, vi, by F. Edgerton; of *Philologus*, lxxiii, by G. D. Kellogg; and of *Romania*, by G. C. Kaidel.

From *Classical Philology*, edited by Paul Shorey, may be noted "Petronius, Poggio, and John of Salisbury," E. T. Sage (an argument that John of Salisbury had knowledge of all of Petronius, whereas we now know only parts, but that there is no evidence that he possessed a manuscript of Petronius); "The New Critical Edition of Ovid's *Metamorphoses*," E. K. Rand, an adverse review, in effect, of the elaborate text-edition of the *Metamorphoses* published in 1914 by H. Magnus, a work hailed at once with acclaim (see YEAR BOOK for 1914); "The *Magistri* of Campania and Delos," A. E. R. Boak (an examination of the position of certain officers, known as "Masters," in these two widely

separated communities: in spite of the wide separation of the communities the officers were much the same); "The *Aparrides* of Cratinus and the Eleusinian Tax Decree," R. H. Tanner (a discussion of the nature and date of a play of Cratinus, one of the three greatest masters of the Old Attic Comedy: the author puts the play in the spring of 442 B. C.); "The Interpretation of Roman Comedy," H. W. Prescott (an examination of the dominant tendencies in the higher criticism of Plautus, the Roman comic writer, of the weakness of modern method here, and of the possibility of safer courses of procedure); "Contradictions in the Seasons of the *Odyssey*," J. A. Scott (a refutation of the view advanced by G. Finsler that there is such contradiction and that, in consequence, we must believe that the poem is the result of the union of two stories of independent origin); "Horace an Atticist," M. B. Ogle; "Horace and Valerius Cato," G. L. Hendrickson (an argument that the eight verses prefixed in some manuscripts to the traditional opening of that piece, *Nempe incomposito diei pede*, were in fact written by Horace, a view contrary to that long held by scholars in general); "The Lot Oracle at Delphi," F. E. Robbins; "On the Expulsion of Foreigners from Rome," R. W. Husband; "Ἐπίκλησις and the Δίκη Νουθευαρχίας," G. M. Calhoun (an examination of the prosecution of perjury at Athens); "Narrative and Speech Scansion in Homer," A. Shewan; "Isocrates and the Epicureans," H. M. Hubbell; "Plutarch's *Alexander* and Arrian's *Anabasis*," R. B. Steele (a study of the extent to which Arrian was influenced by Plutarch); "Latin Diminution of Adjectives," W. Peterson. During the year a General Index to volumes i-x of *Classical Philology*, prepared by F. E. Robbins, was published.

From the *Classical Journal*, edited by F. J. Miller, we mention "The Varus Episode," by W. A. Oldfather (a fresh examination of the defeat of Varus, in the Teutoberg Forest, in 9 A. D., by Arminius), an abstract of a monograph entitled "The Defeat of Varus and the German Frontier Policy of Augustus," by W. A. Oldfather and H. V. Canter, published in *University of Illinois Studies in the Social Sciences*, iv, in June, 1915 (the authors hold that the importance of the defeat has been greatly exaggerated. For a review of the monograph, by R. V. D. Magoffin, see the *Classical Weekly*, x, 30-31); "The Crooked Plow," by Fairfax Harrison, president of the Southern Railway, and a skilled farmer (the paper takes issue strongly with interpretations by classical scholars of Roman descriptions of Roman plows); "Influence of Alexandrian Poetry upon the *Æneid*," by Eleanor S. Duckett; "Fortunatus Et Ille," by T. Frank (an attempt to answer the question why the Greeks and the Romans, who lived in the fairest of lands, speak, on the whole, rather infrequently of the beauties of nature); "Some Features of Ovid's Style: I. Personification of Abstractions," by F. J. Miller; "Election Laws in Republican Rome," R. W. Husband; "The International Law of the Gallic Campaigns," M. Radin; "Aristotle's Doctrine of Katharsis and the Positive and Constructive Activity Involved," A. H. R. Fairchild; "On Certain Ancient Errors in Geographical Orientation," E. T. Merrill; "The Sources of the *Odyssey*," J. A. Scott; "The De-

cline of Roman Tragedy," T. Frank; "A Greek Conception of the Constitution of Matter," J. B. Pike.

From the *Classical Weekly*, edited by C. Knapp, may be mentioned "A Lee Shore," by A. R. Wightman (a discussion of Cæsar, *B. G.* iv, 28, 3, in opposition to the views of T. Rice Holmes, the well known English authority on Cæsar); "The Lucretian Theory of Providence," by G. D. Hadzsits; "Correption in Homeric Speech and Narrative," A. Shewan; "The Later Tradition of Vergil," K. F. Smith; "Advertising Among the Romans," E. T. Sage; "Legislation Against Political Clubs During the (Roman) Republic," R. W. Husband; "Roman Literary Characterization," R. B. Steele. Important reviews in this periodical were the following: J. Burnet, *Greek Philosophy. Part I. Thales to Plato*, by R. B. English; M. H. Morgan, translation of Vitruvius, *De Architectura*, by M. N. Wetmore; J. W. White, *The Verse of Greek Comedy*, by M. W. Humphreys; A. Avellanus, *Pericla Navarchi Magonis*, by C. H. Forbes; T. Frank, *Roman Imperialism*, by A. C. Johnson; W. Leaf, *Homer and History*, by F. G. Allinson.

In vol. xlvii of the *Transactions of the American Philological Association* we find, besides other papers, these: "The Year of the Crucifixion," R. W. Husband (an argument that the crucifixion occurred in 33 A. D.); "The Importance of Special Languages in the Study of Vulgar Latin," A. J. Carnoy, of the Universities of Louvain and Pennsylvania; "An Analysis of the Pagan Revival of the Fourth Century, with Especial Reference to Symmachus," D. N. Robinson; "A Science of Style," E. P. Morris, a presidential address to the American Philological Association, at its annual meeting at Princeton, December, 1915; "Elision and Hiatus in Latin Prose and Verse," E. H. Sturtevant and R. G. Kent; "The Clausula and the Higher Criticism," Susan H. Ballou (an application of the doctrine of rhythmical clausulæ to the *Scriptores Historiæ Augustæ*, in investigations touching matters of composition, historical sources, and the like); "The *Ὀδυσσεὺς* of Cratinus and Euripides," R. H. Tanner; "Seneca's Epigrams," K. P. Harrington; "Democritus' Theory of Sense Perception," R. B. English; "Early Cyprian Greek," G. Hempl.

*Harvard Studies*, xxvii, contained three papers: "The Doctrine of Literary Forms," R. K. Hack; "The Historical Socrates in the Light of Professor Burnet's Hypothesis," C. P. Parker (an indication of "the most important consequences of accepting, as I do heartily, the hypothesis of Professor Burnet as to the historical character of Plato's *Phædo*"); "The Chorus of Euripides," A. E. Phoutrides.

The revised edition (second) of THE NEW INTERNATIONAL ENCYCLOPÆDIA was completed during the year, by the addition of volumes 17-24. All the articles in these volumes that dealt in any way with the matters falling within the wide field covered by classical philology were carefully revised by Charles Knapp.

Of the activities of British classical scholars a hint can be given by the mention of a few of the articles in the *Classical Review* and the *Classical Quarterly*, the best known of the English classical periodicals. From the former we mention "The Homeric Hymns," by T. Agar (conjectures on the text of the hymns); "An

Unnoticed Trait in the Character of Julius Cæsar," W. W. Fowler (the author cites evidences of a tendency on Cæsar's part to take an interest, at times, in ancient procedure, especially that of religion); "The New Lyric Fragments," J. M. Edmonds (a discussion, with translation, of the new fragments of Sappho, published in the *Oxyrhynchus Papyri*, Part X); "Jupiter and the Triumphantor," W. W. Fowler; "Constructive Rhythm in Cicero's Speeches," A. C. Clark. Good reviews were those of W. Leaf, *Homer and History*, by A. Shewan; J. W. White, *The Scholia on the Aves of Aristophanes*, by R. T. Elliot; and of W. Ridgeway, *The Dramas and Dramatic Dances of Non-European Races*, by R. R. Marett.

From the *Classical Quarterly* we name "Some Problems in the Grammatical Chapters of Quintilian," F. H. Colson; "Ovidiana," A. E. Housman; "A Criticism of Criteria," W. R. Hardie (observations on the evidence afforded by meter and diction for the date of Latin poems, an argument against the tendency, strong in England in recent years, to ascribe definitely to Vergil certain of the Minor Poems, commonly, however, regarded as by some one other than Vergil); "An Attempt to Date the Composition of Æneid VII," Gertrude M. Hirst.

In the absence of information about foreign publications, referred to above, it is not possible to set down here, in classified form, as in preceding editions of the YEAR BOOK, lists of books and articles in various fields, not covered above. It remains, then, only to jot down the names of some books that have come to the writer's attention in 1916: editions, in revised forms, of the *Wasps* and the *Clouds* of Aristophanes, by B. B. Rogers; K. Reinhardt, *Parmenides und die Geschichte der Griechischen Philosophie*; Lane Cooper, *A Concordance to the Works of Horace* (published by the Carnegie Institution of Washington); W. W. Fowler, *Virgil's Gathering of the Clans, Being Observations on Æneid VII, 608-817*; J. A. K. Thomson, *The Greek Tradition: Essays in Reconstruction of Ancient Thought* (a collection of essays on classical subjects); H. Taylor, *Cicero: A Sketch of His Life and Works*; C. E. Boyd, *Public Libraries and Literary Culture in Ancient Rome*; C. H. Moore, *The Religious Thought of the Ancient Greeks*; M. Radin, *The Jews among the Greeks and Romans*; W. S. Fox, *The Mythology of the Greeks and Romans*, one of 13 volumes on the *Mythology of All Races*, published by the Marshall Jones Company, Boston; E. Tavenner, *Studies in Magic in Latin Literature*; J. H. Rendel, *The Origin of the Cult of Artemis*; H. Graillot, *Le Culte de Cybèle, mère des dieux, à Rome et dans l'Empire romain*; Maurice Emmanuel, *The Antique Greek Dance*; R. W. Husband, *The Trial of Jesus* (a study of the trial of Jesus, from the point of view of Roman law); Bertha C. Rider, *The Greek House: Its History and Development from the Neolithic Period to the Hellenistic Age*; Ethel B. Abrahams, *Greek Dress: A Study of the Costumes worn in Ancient Greece from Pre-Hellenic Times to the Hellenistic Age*; E. A. Gardner, *A Handbook of Greek Sculpture*; H. N. Fowler, *A History of Sculpture*; E. S. Bouchier, *Syria as a Roman Province*; R. M. Dawkins, *Modern Greek in Asia Minor: A Study of the Dialects of Solli, Cappadocia, and Pharasa*, with texts, translation, and glossary;

E. Pais, *Storia Critica di Roma durante i primi cinque secoli*, vol. ii; A. Van Buren, *A Bibliographical Guide to Latium and Southern Etruria*; H. W. Smyth, *A Greek Grammar for Schools and Colleges*; J. H. Moulton and G. Milligan, *The Vocabulary of the Greek Testament, Illustrated from the (Greek) Papyri and Other Non-Literary Sources*; H. B. Walters, *A Classical Dictionary of Greek and Roman Antiquities, Biography, Geography, and Mythology*. Several well known books reached new editions: R. Heinze, *Virgils Epische Technik* (third edition); L. Whibley, *Companion to Greek Studies* (third); Meillet, *Introduction à étude comparative des langues indo-européennes* (fourth); K. Georges, *Ausführliches Lateinisch-Deutsches Handwörterbuch* (no copy of this work was accessible; it is to be hoped it is a real revision, since a new Latin dictionary is sorely needed); W. Dittenberger, *Sylogæ Inscriptionum Græcarum* (third), vol. i. The important work of Emile Boisacq, *Dictionnaire Etymologique de la langue grecque*, was completed.

**PHILOLOGY, MODERN.** The year 1916 has revealed few contributions of importance to the study of philology. As has been indicated in previous YEAR BOOKS, this is due principally to the fact that the younger generation of philologists, from whom much was to be expected, are engaged with the duties imposed by the war. Nowhere is this more strikingly exhibited than in the study of Celtic, in which such marked progress has been noted in the recent past. The leaders in research in this field hail from England, France, and Germany. Consequently nothing has appeared to indicate in any striking manner the development of these studies. The greatest loss suffered thus far by Celtic philology was by the death of Joseph Déchelette, who fell on the field of battle in Champagne in 1914. The last volume of his noteworthy *Manuel d'Archéologie préhistorique celtique et gallo-romaine*, originally mentioned in these columns for the year 1910, was fortunately left practically complete, and will therefore be issued in due time.

In neutral countries, however, scholars have directed their attention with increasing vigor to the study of philology. This is especially true of Spain, where many useful, if not epochal, works have appeared. It is of interest also to note the advent of women, particularly in Germany, into this line of research. At last the hoary-headed and spectacled professor, as we love to picture him, has encountered an unexpected rival who has made bold to attack many abstruse problems considered heretofore worthy of the more profound intellect of man alone. Though the newcomers have not as yet made their influence in any way deeply felt, we welcome their entrance into this field so long forbidden to them. The marked paucity of male students in German universities is, of course, the fundamental reason for this astonishing social change.

Before beginning to enumerate the works that have appeared during the year 1916, it behooves us to call attention to the two volumes entitled *La Science française* which arrived too late for mention in our previous review. The genesis of this compilation is due to the initiative of the founders of the library of French literature and science at the International Exposition at San Francisco. The second volume

is of especial interest to students of philology inasmuch as it contains essays of an historical character on the following subjects (the authors of which, it may be added, rank among the leading scholars of France): *Les études égyptologiques* by Gaston Maspéro; *la linguistique* by A. Meillet; *l'indianisme* by Sylvain Lévi; *la sinologie* by Ed. Chavannes; *l'hellénisme* by Alfred Croiset; *l'archéologie classique* by Maxime Collignon; *la philologie latine* by René Durand; *la philologie celtique* by Georges Dottin; *les études sur la langue française* by Alfred Jeanroy; *les études sur la littérature française du moyen âge* by the same author; *les études sur la littérature française moderne* by Gustave Lanson; *les études italiennes* by Henri Hauvette; *les études hispaniques* by Ernest Martinenche; *les études anglaises* by Emile Legouis; and *les études germaniques* by Charles Andler. It is unfortunate that the limits of space forbid even a general synopsis of these essays, for it is by means of them that we are enabled to see the immense contributions made by French scholars to these various fields of knowledge. Probably the best example of the keen foresight of Gallic scholars is shown by philology in which they began to enter only after the Germans had thoroughly broken the ground. According to the brilliant Meillet, they realized at once its possibilities, and limited themselves to facts, staunchly refusing to yield to the glamor of general—and often false—hypotheses, the bane of the past generation. Notwithstanding that there have been numerous German schools of philology, there has never been a French school for the simple reason that *savants* of that nationality have always drawn their conclusions from data, and have refrained from accepting any theory that was not entirely in accordance with facts. At the outset Frenchmen sought to approach the subject from every angle in order to bring all possible light to bear upon it. It is this above all which has prevented their works from becoming archaic so rapidly, and has at the same time led to the introduction of new fields of study, such as semantics, dialectology, phonetics, and kindred subjects. Without the initiative of the Gallic mind philology would have soon passed into a state of total inertia, if not possibly one of degeneration and decay. To quote the words of M. Meillet, "le trait essentiel et dominant est le souci de demeurer en contact étroit avec les faits. Qu'ils aient eu pour objet des langues mortes ou des langues vivantes, des langues littéraires ou des parlars populaires, les linguistes français se sont attachés, avant tout, à suivre avec souplesse la réalité dans sa complexité, dans sa variété infinie. Ils n'ont pas essayé de ramener l'histoire à un simple schéma; ils se sont efforcés de la suivre dans ses détours. S'ils ont rencontré la notion de dialecte, ils l'ont dissoute dans celle, plus réelle, de faits dialectaux, et ils se sont efforcés, par exemple, de tracer, non les limites des dialectes, mais les limites des faits dialectaux." The outcome of these methods was not only the monumental *Atlas linguistique de la France* of Gilliéron and Edmont, of which the eminent critic, Gaston Paris, said that "la science française peut légitimement s'enorgueillir," the *Sémantique* of Breal, the acute *Aires morphologiques dans les parlars de l'Angoumois* of Terracher, and the *Dissimila-*

tion *consonantique* of Grammont—a work so new and so original that it is still little understood—but also the *Histoire de la langue française* of Brunot—of which, according to M. Jeanroy, there is no equivalent at present in any other country—the great impulse given to phonetics by the researches of Abbé Rousselot, and others, the development along characteristic lines of the Celtic school, and the rehabilitation of the spoken language made by Meillet in his suggestive contributions to the study of Armenian, Slavic, and Greek. It is thus not so much by *des recherches de détail*, as by the *introduction de vues neuves et de directions originales* that philology has received new vigor from French thought.

As regards this subject, future scholars will no doubt consider ours an era of transition, characterized by a study of details and grouping of facts. This science—if so it may be called—is yet too young to have its Darwin or its Spencer. But when all possible fields shedding any light on it have been opened up, when language will be considered the corollary of the study of man in his widest relations, when, in a word, thought and its expression will be subjected to the most careful analysis, then most certainly will we be able to grasp the true import of the study of philology. Thanks mainly to the originality of the Gallic mind, philology has passed from a state of arid, and often puerile, theory to one of a more innate relation with human life in general. It remains for the future to reveal to us the significance of this evolution.

In our enumeration of philological works of value, it should not be forgotten that because of the great European upheaval many reviews have either suspended publication or only appear sporadically, while others are delayed in the mails. Hence in our review for 1915 many works that appeared toward the close of the year failed to receive due mention. As they are included in the present summary, the reader is reminded that whenever no date is given it means that the work appeared in 1916.

GENERAL. Among the most important works of a general nature are F. de Saussure's *Cours de linguistique générale*, edited by Bally and Séchehaye (Paris), and the second edition of O. Schrader's *Die Indogermanen* (Leipzig). R. de la Grasserie's *Du caractère concret de plusieurs familles linguistiques américaines* (Paris), and C. S. R. Collin's *Bibliographical Guide to Sematology* (Lund, 1915) are also general works of great value. L. Wiener's *Commentary to the Germanic Laws and Medieval Documents* (Cambridge, Mass.) is an excellent example of the dangers of uncontrolled theorizing. E. Sapir's *Time Perspective in Aboriginal American Culture* (Ottawa) is an exceedingly interesting and suggestive study in method. Useful compilations of a general nature are the *Folk-Lore, Manners and Customs, Social Groups*, issued by the Library of Congress (Washington), which treats of communities, classes, races, general works, and polygraphy; A. Hettler's *Philologenlexikon* (Halle), containing biographies and bibliographies of all the leading German philologists; and P. Schulze's *Deutsche Zeitschriften-Katalog* (Leipzig), containing about 3700 titles of articles. In the Indo-Iranian group of languages, E. W. Hopkins's *Epic Mythology*, published in the *Grundriss der indoarischen Philo-*

*ogie* (Strassburg, 1915), is probably the most important contribution. It may not be out of place to mention also A. von Ow's *Brahma-Woden: Indogermanische Zusammenhänge* (Regensburg), and D. N. Neogi's *Sacred Tales of India* (New York). A work of far-reaching importance, which has been in publication for many years, is J. Bloch's *La formation de la langue marathe*, of which the 215 fascicule has just appeared (Paris). It is devoted to one of the leading modern members of the southern group of the Indo-Aryan languages (see article MARATHI in the NEW INTERNATIONAL ENCYCLOPEDIA, vol. xv, page 61), and is an excellent specimen of rigorous and careful linguistic method. Other works lying somewhat outside of this domain, but deserving of mention are P. Abelson's *English-Yiddish Encyclopædic Dictionary* (New York, 1915), and G. Maspéro's excellent *Grammaire de la langue khmère* (Paris), devoted, as its title indicates, to Khmer, the leading dialect of Cambodia (see article CAMBODIA in N. I. E., vol. iv, page 369).

SLAVIC. Likewise in this field very little of a serious nature has been issued. A. Leskien's collection entitled *Balkanmärchen aus Albanien, Bulgarien, Serbien und Kroatien* (Jena, 1915), M. Zunković's *Slavische Runen-Denkblätter* (Kremsier, 1915), and H. Petersson's *Zur slavischen und vergleichenden Wortforschung* (Lund, 1915) may be deserving of mention. Practical works abound, even for languages which received little attention heretofore. The titles of a few of the most important are the following: Russian: M. de Valette and Olga Klionoff, *Introduction à l'étude de la langue russe* (Paris), and N. Forbes's *Russian Grammar* (Oxford). Serbian: P. Lanux and A. Onyévitch, *Grammaire de la langue serbe* (Paris), and Mlle. D. Vékovitch, *Dictionnaire français serbe* (Paris). Polish: J. F. Baluta, *Practical Handbook of the Polish Language* (New York, 1915); Legowski, *Methodische Grammatik der polnischen Sprache* (Leipzig); B. Manassewitsch, *Praktische Grammatik der polnischen Sprache* (7th ed., Vienna, 1915); Hill's *Polish-English and English-Polish Dictionary* (London), a small but very useful work; Wasikowski, *Kleines Taschenwörterbuch der deutschpolnischen und polnischdeutschen Sprache* (Berlin, 1915); and Booch-Arkossy, *Vollständiges Polnisch-Deutsches und Deutsch-Polnisches Wörterbuch* (16th ed., 2 vols., Leipzig). As for Czech or Bohemian we may mention J. Herzer's extensive *Böhmisch-deutsches Wörterbuch* (Prague) of which the 78th *heft* appeared. (For CZECH, see N. I. E., vol. vi, page 421.)

CELTIC. Among the general works intended for the layman the reader is referred to Joseph Dunn's *The Study of Celtic* which appeared in the *Catholic University Bulletin*, and J. L. Gerig's *Celtic Studies in the United States*, published in the *Columbia University Quarterly*. In Irish we have Stephen Brown's *Ireland in Fiction* (London), the purpose of which is to serve as a guide to Irish novels, tales, romances, and folklore. The best and most complete translation of the famous epic, the *Táin Bó Cúilnge*, was made by J. Dunn in 1914 (London). Since that time there has appeared an edition of the same, consisting of the text of the Yellow Book of Lecan with variant readings from the Lebor na hUidhre, begun by

the late John Strachan and completed by J. G. O'Keefe (Dublin), C. J. S. Marstrander's *Bidrag til det norske sprogs historie i Irland* (Christiania, 1915), P. Walsh's *Place-Names of West-Meath* (Dublin, 1915), and T. O'Neill Lane's *Larger English-Irish Dictionary* (ib.) are valuable as reference works. G. F. Black's *List of Works Relating to Scotland*, published by the New York Public Library, contains important sections on Gaelic language and literature (pp. 912-930). As for Welsh, we note the following works more or less closely related to that field of research: L. Mühlhausen's *Die lateinischen, romanischen, germanischen Lehnwörter des Cymrischen, besonders in Codex Venedotianus der cymrischen Gesetze* (Leipzig dissertation, 1914); G. L. Kittredge's *Study of Gawain and the Green Knight* (Cambridge, Mass.), H. O. Sommer's *Vulgate Version of the Arthurian Romances* (Washington), consisting of an index of names and places to vols. i-vii; and V. Creacini and V. Todesco, *L'Inchiesta del San Graal* (Barcelona), yet incomplete.

ENGLISH. Works of a rather general appeal are: G. A. Nicholson's *English Words with Native Roots and with Greek, Latin, and Romance Suffices* (Chicago); T. DeVries's *Holland's Influence on English Language and Literature* (Chicago); E. Weekley's *Surnames* (London); and H. Harrison's *Surnames of the United Kingdom* (London), a concise etymological dictionary, of which parts 14-16 of vol. ii were issued. The subject of place-names, to which the British and Americans began to give their attention only a few years ago, possesses at present a bibliography of considerable extent. Among the more important contributions of the year are C. E. Jackson's *Place-Names of Durham* (London); Rev. A. T. Bannister's *Place-Names of Herefordshire* (Cambridge); W. Rye's *Scandinavian Names in Norfolk* (Norwich); and the *Fourth Report of the United States Geographic Board (1890-1916)* (Washington), which contains a list of place-names in the United States with the changes in spelling recently introduced. In Anglo-Saxon the 5th edition of E. Sievers's *Abriß der angelsächsischen Grammatik* (Halle) appeared at the close of the year 1915. The publication of T. N. Toller's *Anglo-Saxon Dictionary based on the MS. Collections of the late Joseph Bosworth*, which had been interrupted for some time, was resumed (part ii, Oxford). J. R. C. Hall's *Concise Anglo-Saxon Dictionary for the Use of Students* (2nd ed., New York), was a welcome addition. Nor was Beowulf neglected. Among the contributions to this field of research in English philology are R. Wickberg's *Beowulf översatt* (Upsala, 1915), a translation into Swedish; Chr. Kier's *Beowulf, et bidrag til nordens oldhistorie* (Copenhagen, 1915); and A. J. Wyatt's *Beowulf, with the Finnsburg Fragment*, revised by R. W. Chambers (Cambridge, 1914). Syntactical questions also claimed the attention of many students. The most important works of this nature are E. Reinecke's *Der Gebrauch des bestimmten Artikels in der englischen Prosa des 16. Jahrhunderts* (Halle dissertation, 1915); M. Schröter's *Der bestimmte Artikel bei Flussnamen im Neuenglischen* (Halle diss., 1915); V. Schultz's *Das persönliche Geschlecht unpersönlicher Substantiva bei Spenser* (Kiel diss., 1914); W. Azzalino's *Die Wortstellung im King Horn* (Halle

diss., 1915); H. Kreickemeyer's *Die Wortstellung im Nebensatz des Englischen* (Giessen diss., 1915); V. Marinoff's *Die periphrastische Form des englischen Verbums in ihrer Verwendung als Intensivum in modernen Sprachgebrauch* (Halle diss., 1915); Ch. Müller's *Die englische Lautentwicklung nach Lediard (1725) und anderen Grammatikern* (Giessen diss., 1915); and A. Wuth's *Aktionsarten der Verba bei Cymquulf* (Leipzig diss., 1915). Other works deserving mention are: H. Bradley's *Numbered Selections in Old English Poetical MSS.* (Oxford, 1915); P. Feuerherd's *Geoffrey of Monmouth und das Alte Testament with respect to the Historia Britonum of Nennius* (Halle diss., 1915); Ida Geisel's *Sprache und Wortschatz der altenglischen Guthlaüberetzung* (Basle diss., 1915); K. Breul's *Goliard's Song Book of the Eleventh Century* (Cambridge, 1915); H. Tardel's *Zwei Liedstudien* (Bremen, 1915), dealing especially with the ravenballads of England and Scotland; E. Sieper's *Die altenglische Eleyie* (Strassburg, 1915); J. E. Wells's *Manual of the Writings in Middle English 1050-1400* (New Haven); and G. H. Cowling's *Dialect of Hackness (Northeast Yorkshire)* (Cambridge). Text-books of interest are: C. Noble's *Story of English Speech* (Boston); D. M. Staley's *Psychology of the Spoken Word* (ib.); and R. P. Utter's *Everyday Words and Their Uses* (New York). The Oxford English Dictionary has continued publication without interruption. The parts that were issued during the year 1916 are the following: vol. ix, *subterraneously-sullen*, by C. T. Onions (January); vol. x, *turndun-tsivrid*, by Sir J. A. H. Murray (April); vol. ix, *stead-stillatim*, by H. Bradley (July); and vol. x, *v-verificative*, by W. A. Craigie (October). The 3rd edition of *Webster's Collegiate Dictionary* (Springfield, Mass.) also made its appearance. F. J. Willstach's *Dictionary of Similes* (Boston), and F. H. Vizetelly's *Twenty-Five Thousand Words Frequently Mispronounced* (New York) should not be omitted.

DUTCH. In addition to the work of De Vries mentioned above, the only contribution that seriously concerns our field is J. van Ginneken's and W. Kea's *Handboek der nederlandsche Taal* (Nijmegen), of which the second part was issued.

SCANDINAVIAN. Besides the work of W. Rye, which has already been noted, the following general works are of interest: T. W. Arnoldson's *Parts of the Body in Older Germanic and Scandinavian* (Cambridge); Klara Stroebe's *Nordische Volksmärchen*, edited by F. von Leyen and P. Zauert (2 vols., Jena, 1915), comprising most of the well-known tales of Denmark, Sweden, and Norway; S. Nordal's *Om Olaf den helliges Saga, en kritisk Undersogelse* (Copenhagen); M. Olsen's *En Indskrift med aeldre runer fra Gjernsvik i Søndhordland* (Bergen, 1915); and F. A. Wimmer's *Collectio runologica Wimmeriana* (Copenhagen, 1915). In Icelandic we note W. A. Craigie's *The Icelandic Sagas* (New York, 1915); F. Jónsson's *Rímna-safnsamling af de aeldste islandske rimer* (Copenhagen); A. G. Brodeur's *The Prose Edda by Snorri Sturluson* (New York), an English translation; H. Hermannsson's *Icelandic Books of the 16th Century* (Ithaca); and the *Diplomatarium Islandicum (1510-1544)*, published at Reykjavik. The contributions to Norwegian philol-

ogy consist of H. Falk's *Altnordische Waffenkunde* (Christiania, 1915); C. Jensen's *Den norske Dictionarium eller Glosebog* (ib.), new ed. by T. Hannaas; M. Haegstad's *Vestnorske Maalføre fyre 1350* (ib., 1915); K. Liestol, *Norske Trollviser og Norrone Sogor* (ib., 1915); D. A. Seip's *Lydverket i Asdølmdlet* (ib., 1915), and the same author's *Grundlaget for det norske rikemaal* (ib.). The modern language is treated in Seip's *Norsk Grammatik* (4th ed., ib., 1915) and G. T. Flom's *Phonology, of the Dialect of Aurland, Norway* (Urbana, Ill., 1915). In Swedish A. Koch's *Umlaut und Brechung im Altchwedischen* (Lund), which was begun in 1911, was completed in 1916. The 21st fasciculus of A. Noreen's *Vårt Språk, Nysvensk Grammatik utförlig framställning* (ib.) was issued during the course of the year. Other works deserving mention are O. von Friesen's *Runorna i Sverige* (Upsala, 1915); O. Ostergren's *Nysvensk Ordbok* (Stockholm, 1915) of which the first fasciculus appeared; H. Alving's *Det grammatiska subjektets plats i den narrativa satsen i svenskan* (Upsala); and M. Borgström's *Svenska språkets historia* (ib.). As for Danish, H. Bertelsen's *Danske Grammatikere fra Midten af det syttende til Midten af det attende Aarhundrede* (vol. i, Copenhagen, 1915), and J. V. Lindgren's *Dansk och norsk grammatik* (2d ed., Stockholm, 1915) are the only works of importance to reach us.

GERMAN. Among the leading works dealing with the early period of the language are E. A. Kock's *Altgermanische Paradigmen* (Lund, 1915); J. Zupitza's *Einführung in das Studium des Mittelhochdeutschen* (Chemnitz); and J. Schatz's *Altbairische Grammatik* (Göttingen, 1915). Other works of a more special character are B. Dicken's *Runic and Heroic Poems of the Old Teutonic Peoples* (Cambridge); *Der Heliand*, a Saxon poem of the ninth century (Cassel, 1915); F. Saran's *Das Hildebrandslied* (Halle, 1915); M. Lexer's *Mittelhochdeutsches Taschenwörterbuch* (13th ed., Leipzig, 1915); R. Th. Christiansen's *Die finnischen und nordischen Varianten des zweiten Merseburger Spruches* (Hamina, 1915), a comparative study; M. J. Rudwin's *Der Teufel in den deutschen geistlichen Spielen des Mittelalters und der Reformationszeit* (Baltimore, 1915); and C. Koehne's *Gewerbrechtliches in deutschen Sprichwörtern* (Zürich, 1915). Of a syntactical nature are: J. E. Hägberg's *Untersuchung über die Wortstellung in Heliand* (Kemberg, 1915); M. Kleinbrückner's *Reimgebrauch Konrads von Würzburg im Engelhard* (Duppau, 1915); Dorotea Ebert's *Die Sprache des Trierer Paalters* (Marburg diss., 1915); A. Wolf's *Das Präfix uz- im gotischen und im deutschen Verbum* (Breslau diss., 1915); R. Fey's *Neuhochdeutsche Appositions-Gruppen, unter besonderer Berücksichtigung der psychologischen Verhältnisse untersucht* (Halle); O. P. Rein's *Mixed Preterites in German* (Baltimore, 1915); E. H. Sehrts's *Zur Geschichte der westgermanischen Konjunktion "Und"* (Baltimore); and T. W. Arnoldson's *Parts of the Body in Older Germanic and Scandinavian* (Cambridge). Studies of dialects are far less numerous than usual. Those deserving mention are J. Bayer's *Matthias Joseph de Noël und seine Dichtungen in kölnischer Mundart* (Cologne, 1915); R. Hörter's *Die mundartliche Kunstdichtung der Siebenbürger Sachsen* (Hermannstadt, 1915); K. Schiffmann's *Die Sta-*

*tionsnamen der Staatsbahnlilien in Oberösterreich erklärt* (Linz, 1915); and A. Halbedel's *Fränkische Studien* (Berlin, 1915). One cannot overemphasize the study of loan words because of their importance in tracing the history of a language. They not only show the foreign influences exerted upon a language, but serve to indicate also the precise period in which linguistic changes have taken place. In Germany the tendency of late has been toward this study. Among the various works dealing with loan words we may note P. Möller's *Fremdwörter aus dem Lateinischen im spätern Mittelhochdeutschen und Mittelniederdeutschen* (Giessen diss., 1915); A. Tesch's *Fremdwort und Verdeutschung* (Leipzig, 1915), a useful dictionary; O. Kresse's *Verdeutschung entbehlicher Fremdwörter* (Berlin, 1915); and T. E. Karsten's *Germanisch-Finnische Lehnwortstudien* (Helsingfors, 1915), which treats of the earliest linguistic and cultural history of the Teutons. Interesting as a chauvinistic document is A. Baumann's *Wede, die Verständigungssprache der Zentralmächte und ihrer Freunde* (Diessen, 1915), which represents an effort to create a new international language of Central Europe. An abridged edition of O. Lyon's *Handbuch der Deutschen Sprache* (Leipzig), edited by W. Scheel, also made its appearance. Two philological dictionaries deserve mention, one by H. Schmidt (2d ed., ib.) and the other by P. Thormeyer (ib.). Finally H. Barth's *Bibliographie der Schweizer Geschichte* (vol. iii, Basle, 1915) contains a good bibliography of studies touching upon the linguistic history of Switzerland (pp. 230-242).

ROMANCE. For those wishing to keep in touch with the development of this field of research the following annual bibliographies are noted: *International Index to Periodicals for 1914* (vol. xiv, Leipzig, 1915); *Kritischer Jahresbericht über die Fortschritte der romanischen Philologie*, edited by K. Vollmöller, of which the present volume (xiii) is devoted to years 1911-12 (Erlangen, 1915); and *Mitteilungen und Abhandlungen aus dem Gebiet der romanischen Philologie* (vol. iii, Hamburg, 1915). J. Th. Graesse's translation of the *Gesta Romanorum*, a popular collection of anecdotes of the later Middle Ages (see N. I. E., vol. ix, p. 713), was revised by H. Hesse (Leipzig, 1915). K. Dürre's *Die Mercatorszene im lateinischliturgischen, altdutschen und altfranzösischen religiösen Drama* (Göttingen diss., 1915) is of value for the student of religious drama.

FRENCH. The second fasciculus of A. Tobler's *Altfranzösisches Wörterbuch*, edited by E. Lommatzsch, which includes *aber-aima*, appeared at the close of the year 1915 (Berlin). In Old French we note the following works: C. Appel's edition of *Bernart von Ventadorn, Seine Lieder* (Halle, 1915), containing an introduction and glossary; H. Breuer's edition of *Cristal et Clarie*, a romance of adventure of the thirteenth century (ib., 1915); H. d'Andeli's *Battle of the Seven Arts*, a French poem of the thirteenth century, edited and translated by L. T. Paetow (Berkeley, Cal.); S. Scheler's *Sitten und Bildung der französischen Geistlichkeit nach den Briefen Stephans von Tournai*, an author of the twelfth century (Jena diss., 1915); K. Simon's *Die Chanson de Renaud de Montauban* (Griesswald diss., 1915); and J. Orr's *Les Œuvres de Guicot de Provins* (London). Dealing with syn-

tax and other technical questions are B. F. Luker's *Use of the Infinitive Instead of a Finite Verb in French* (Columbia diss., New York); E. Stimming's *Der Accusativus cum Infinitivo im Französischen* (Halle, 1915); S. Merian's *Die französischen Namen des Regenbogens* (Basle diss.); H. Rotzler's *Die Benennungen der Milchstrasse im Französischen* (Basle diss.); and R. Klein's *Die Wortstellung im Französischen* (Leipzig, 1915). In dialectology we have L. Gauchat's valuable *La Trilogie de la Vie: articles-spécimens du Glossaire des Patois de la Suisse romande* (Lausanne); and E. Labadie's *Catalogue d'une collection de plus de 500 ouvrages en patois gascon et languedocien faisant partie de la bibliothèque de l'auteur*, with a preface by E. Bourciez, a mine of information (Bordeaux). While not belonging precisely to our field the *Manuel de numismatique française* (Paris) of A. Blanchat and A. Dieudonné is too important to be overlooked. A few grammars of the modern language are Fischer-Dedet's and Bauer's *Grammaire française* (Paris, 1915); A. Prévost's and J. Laurent's *Cours de langue française* (ib., 1915); and H. E. Berthon's *Première grammaire française* (New York). Useful language manuals are *The Soldier's Language Manual* by Ajax, for English and French (6th ed., London, 1915); and Plumon's *Guide français-anglais* (Paris, 1915), containing lists of technical terms and locutions. In the list of dictionaries for general use we note J. Guérin's and G. Bovier-Lapierre's *Nouveau dictionnaire universel illustré* (Tours); W. James's and A. Molé's *Dictionary of the French and English Languages* (new ed., New York); J. Bellows's *Dictionary of French and English*, revised by W. Bellows (London); *Dictionnaire des termes militaires et de l'argot poilu* (Paris); J. Saulnier's *Petit dictionnaire orthographique de poche* (Bordeaux); and Faustina de Graziani's *Dictionnaire italien-français* (Paris). L. Sainéan's *L'Argot des tranchées* (ib., 1915) is an interesting study of a rapidly growing colloquial speech. H. P. Thière's *Essai sur l'histoire du vers français*, with a preface by Gustave Lanson (ib.), is one of the important works of the year. The publication of Lorenz's *Catalogue générale de la Librairie française* is being resumed (vols. xxiv and xxv, fasc. 1, ib., 1915).

ITALIAN. (On the early literature of Italy the only work to be noted is R. Palmieri's *Studi di lirica toscana anteriore a Dante* (Florence). There are, however, many additions to the list of studies of the numerous and varied Italian dialects which heretofore have unfortunately received little attention. G. Bertoni's *Italia dialettale* (Milan) is the best general work on the subject. Other works extending over vast periods of linguistic history are L. Frati's *Rimatori bolognesi del trecento* (Bologna, 1915); *Chartularium Studii Bononiensis, documenti per la storia dell'Università di Bologna della origini fino al secolo xv* (vol. iii, ib.); G. Zaccagnini's and A. Parducci's *Rimatori Siculo-Toscani del dugento* (Bari, 1915), including those of Pistoia, Lucca, and Pisa; A. Leotti's *L'Albanese parlato* (Milan), with vocabularies, proverbs, and locutions; G. Malagoli's *La Letteratura vernacola pisana posteriore al Fucini* (Pisa, 1915), with notes and glossary; A. Trauzzi's *Arte e limiti linguistici nella dialettologia italiana moderna* (Rocca San Casciano); and G. Piccio's *Dizionario veneziano-italiano* (Venice).

G. L. Passerini's *Vocabolario Carducciano* reappears with two appendices containing vocabularies to D'Annunzio and Pascoli. A. Paviolo's *Il Vocabolario amministrativo* (Cuneo) and J. Gelli's *Divise, moti, imprese di famiglie e di personaggi italiani* (Milan) are of more interest to the Italian than to the foreigner. N. Tommaseo's *Dizionario della lingua italiana*, edited by G. Biagi (Turin), and O. Pierini's *Lingua italiana* (Bologna) are intended for native students.

SPANISH. J. A. Coelho's *As Nacionalidades ibéricas* (Lisbon, 1914) deals with the history of the Iberians in Central and Southern Spain and Portugal. L. Pfandl's *Beiträge zur spanischen und provenzalischen Literatur- und Kulturgeschichte* (Bayreuth, 1915) treats of the Middle Ages. A. Castro's and F. de Onis's *Fueros leoneses de Zamora, Salamanca, Ledesma y Alba de Tormes* (Madrid) is of interest for the history of the ancient dialects of those regions. Other dialect studies are P. de Zamaripa y Uraga's *Gramática vascóngada* (Bilbao, 1915); Ll. Fullana Mira's *Gramática elemental de la llengua valenciana* (Valencia, 1915); J. de Llamano y Beneite's *El dialecto vulgar de Salamanca* (Salamanca, 1915); A. Bastafias's *Galicismos, barbarismos, hispanismos* (Madrid, 1915); and M. de Toro y Gisbert's *Americanismos* (Paris, 1915). The fourth volume of Cejador y Frauca's *Historia de la lengua y literatura castellana*, dealing with the period of Philip III has just appeared (Madrid). The third volume of F. Pinochet-Le-Brun's *Crestomatía española* is devoted to the literature of the pre-classical period (Santiago, Chile, 1915). C. C. Marden's *Critical Edition of the Spanish Apollonio* (Baltimore) and F. M. Pabano's *Historia y costumbres de los gitanos* (Barcelona, 1915) are of interest to specialists. Useful bibliographical works are P. Goldsmith's *Brief Bibliography of Books in English, Spanish, and Portuguese relating to the Republics Commonly Called Latin American* (New York, 1915), and W. Hanssler's *Handy Bibliographical Guide to the Study of the Spanish Language and Literature* (St. Louis, Mo., 1915). Two works of value to the foreigner are R. Blanco Sánchez's *Tratado elemental de la lengua castellana* (6th ed., Madrid, 1915) and the *Repertorio de palabras usuales castellanas de sentido análogo, semejante o apropiado* (Barcelona).

CATALAN. The first three parts of the valuable *Diccionari Aguiló* appeared during the year at Barcelona. Excellent collections of texts are also being issued. Those of note are R. d'Alós's *Crestomatía catalana* (ib.); P. Barnils's *Textes catalans avec leur transcription phonétique* (ib.); and J. Arteaga Pereira's *Textes catalans* (ib.). Other works relating to this little studied language are F. Martorell's *Recull de Documents de l'epoca comtal* (ib.); M. de Montoliu's *La Llengua en la Crònica del rei En Jaume* (ib.); P. Barnils's *Problemes fonològics del Català* (ib.); and the same author's *Revisió de fonètica catalana* (ib.). Useful vocabularies are F. Barjau's *Diccionari hebreu-llatí-català* (ib.); *Diccionari manual llatí-català* (ib.); P. Barnils's *Vocabulari català-alemany de l'any 1502* (ib.); and the *Vocabulari ortogràfic de la llengua catalana* (ib.) published by the Institut d'Estudis catalans.

OTHER ROMANCE LANGUAGES. In Provençal the only work to appear is the *Armana prou-*

vençau (Angin), which is of little interest to us. In Portuguese, Th. Braga, former president of the republic, has just issued the third volume of his *Historia da Litteratura portugueza* (Porto), which treats of the sixteenth century. A good manual is G. Eilers's *O Brasileiro, Lehr- und Lesebuch der portugiesischen Sprache* (Heidelberg, 1915). In Rhaeto-Romance there appeared A. Velleman's *L'Aggettiv e il pronom nella lingua ladina d'Engiadin Ota* (Zurich, 1915); and C. Decurtins's *Rätoromanische Chrestomathie* (vol. x, part 2, Erlangen). And lastly in Rumanian we have O. Densusianu's *Gratul din Tara Hategului* (Bucharest).

**PHONETICS.** Few works of importance were issued during the year. Among the studies of a general nature the 10th edition of W. Viëtor's *Kleine Phonetik des Deutschen, Englischen und Französischen* (Leipzig, 1915) is probably the most noteworthy. G. Noël-Armfield's *General Phonetics* (Cambridge, 1915) is intended for missionaries and students of languages. In English phonetics we note C. M. Rice's *Short English Poems for Repetition* (Cambridge, 1915), with phonetic transcript; and W. Thomson's *Laus of Speech-Rhythm* (Glasgow). In German, W. Viëtor's *Deutsches Aussprachewörterbuch* (2d ed., Leipzig, 1915). In French, M. Grammont's *Traité pratique de prononciation française* (Paris); F. Beyer's *Französische Phonetik für Lehrer und Studierende* (4th ed., Cöthen); Chabert's and Labernadie's *Les vices de prononciation et leur correction* (Paris); and G. Bonnard's *Elementary Grammar of Colloquial French on a Phonetic Basis* (Cambridge, 1915). G. de Gregorio's *La riforma ortografica dell'inglese, del francese e dell'italiano* (Palermo, 1915), and M. G. Revilla's and A. Quijano's *Un dictamen sobre la ortografia fonética* (Mexico) may also be mentioned.

**PHILOSOPHY.** The war, in our day, has performed for philosophy much the same service which Cicero ascribes to Socrates, in his day, bringing her down from the heavens and introducing her familiarly into the houses and affairs of men. A glance at the titles, whether in periodicals or book lists, is sufficient to show that in 1916 the speculative mind of Europe and America has had small leisure for the remote and transcendental; in events such as now move the world human conduct is the engrossing interest, and while this interest frequently and necessarily leads to surveys of nature beyond the sphere of human nature, yet these surveys are mainly brief excursions, turning speedily back to the world beneath the moon and the political and religious gropings of human kind. The cold "tough-mindedness" of nation-builders is reacting in philosophy to produce its antipathetic "tenderness"—which means, after all, but that men desire reason only for what they love.

Political philosophizing is the prerogative of all the world. In ordinary times, when states are smooth-running, the prerogative is exercised mainly by the chair; but in times such as the present, when all human institutions seem caught up in the winds of limbo, men of every persuasion criticise, theorize, and utopianize. Along with the professional philosophers come jurists, diplomatists, clergymen, literati, and even mathematicians, proclaiming ills and crying cures; so that it is impossible to show any clear margin between the political theorizing of philosophers and the political philosophizing of theorists.

The most that the reviewer, attached to the philosophical side, can do, is to indicate what portion of the work falls from the pens of the philosophic profession, with the open understanding that this is but an arbitrary fraction of the whole.

There are few names important in philosophy—at least in the neutral and Allied countries—that are not represented in the year's expression; and among them all none more affectingly than Josiah Royce (q.v.), whose death, September 14th, deprives us of a striking personality as well as a profound thinker. Few speeches, in a year of speech-making, have been so moving as the address which Professor Royce delivered at Tremont Temple, Boston, at the very beginning of the year, January 30th, on "The Duties of Americans in the Present War"—an address widely circulated in pamphlet form; and there is a certain dramatic propriety in the fact that one of the late books of the year should be a collection of essays voicing the fine and eloquent social idealism for which the author had so earnestly lived and so stoutly fought; indeed, Royce's *The Hope of the Great Community* (New York) strikingly recalls the last work of the greatest of ancient idealists, for Plato, too, amid the contentions of nations, turned from dialectic to create the *Laws*, that his fellow citizens might live the more nobly.

Dramatic interest attaches also to the *Justice in War-Time* (Chicago) of the Hon. Bertrand Russell—a plea for chivalrous generosity and a clear-headed righteousness in the hour of war. It was announced in the spring of the year that Mr. Russell would lecture on logic and ethics at Harvard, beginning with the fall term; but he was convicted in England under the "defense of the realm" act and passports were refused him. J. Mark Baldwin, who has been a notable pleader for the Allies, delivered the Herbert Spencer lecture at Oxford University, March 15th, on "The Super-State and the 'Eternal Values,'" the main point of which is that in the German view the nation is instrumental to the state, while the democratic view is that the state is rather the instrument. The address is reprinted as a pamphlet (Oxford). Emile Boutroux's *Philosophy and War* (translation, London) is a similar contrast of German ideals with the more distinct personalism of French and west European thought. Baron Friedrich von Hügel's *The German Soul* (London) contains two essays, or studies, one on "Christianity in face of War," the other on "The German Soul and the Great War," in the latter showing from a more intimate angle the root of the contrast which all writers feel between Germany and the West: "Weltanschauung" is at the root of the German's conception of "Weltpolitik" and his place in it. Of especial interest, as treating the war from a scientific rather than from the moral angle, is Gustave Le Bon's *The Psychology of the Great War* (New York). George Santayana's *Egotism in German Philosophy* (New York) and John Dewey's *Democracy and Education* (New York) are perhaps the most significant books, in the political relation, yet to mention from American philosophers—although Professor Dewey's work is directed not primarily to statecraft, but to statecraft through education. More remote from the present crisis than most of the foregoing, but still with the theory of the state at heart are Frederick J. E. Woodbridge,

*The Purpose of History* (New York), and David G. Ritchie, *Natural Rights* (London).

Only less striking than the turn toward political theorizing is the activity of philosophic thought in the field of religion—for in a generation marked by the destruction of so many and so great material goods it is natural for men to seek in the spiritual world a satisfying faith. Books in this field might be divided into several classes. There are first, the frankly theological and devotional works on Christianity, and with these might go some borderland books, partly in the philosophic mode. Such titles as Brother Chrysostom, *The Development of Personality* (Philadelphia), Jas. R. Cameron, *The Renaissance of Jesus* (London), J. N. Shearman, *The Natural Theology of Evolution* (London)—the latter adapting Paley's argument to modern theories of evolution—illustrate the variety of the class. There are, again, books drawing their inspiration from the philosophy of Bergson, which seem to form a class by themselves and which surely have more of the "inspirational" than of the rational elements of Bergsonism at their foundation. Horace J. Bridges, *The Religion of Experience* (New York), Lucius H. Miller, *Bergson and Religion* (New York), are examples of the better type; though it should be stated that Bergsonian literature is too prolix and various to be easily characterized, ranging all the way from criticism, as G. W. Cunningham, *A Study in the Philosophy of Bergson* (London), to whimsically imitative titles of unimportant books—*Creative Involution*, *The Creative Will*, are instances. In a third group belong books treating of non-Christian religions, chiefly Indian. The aroused interest in the East and its thought is certainly reflected in the number of books, scholarly or enthusiast, on Oriental religion. R. W. Frazer, *Indian Thought Past and Present* (late 1916, London), is a survey of the field; other books are, "Sister Nivedita" (Margaret E. Noble), *Religion and Dharma* (London); Jagmanderlal Jaini, *Outlines of Jainism* (Cambridge University); K. J. Saunders, *The Story of Buddhism* (Oxford); Frederick G. Henke, *The Philosophy of Wang Yang-Ming* (Chicago). A fourth type of interest is represented by comparative and other studies of religion and religious philosophy. Louis H. Jordan, *Comparative Religion: its Adjuncts and Allies* (Oxford), Clement C. J. Webb, *Group Theories of Religion and the Religion of the Individual* (London), and Durant Drake, *Problems of Religion* (Boston), are significant examples. Such purely scholarly books as C. H. Moore's *The Religious Thought of the Greeks from Homer to the Triumph of Christianity* (Harvard Press), and Isaac Husik's *A History of Mediæval Jewish Philosophy* (New York), are primarily of importance to the historian of philosophy, and it need hardly be added that both cover fields for which comprehensive treatments have been a decided desideratum. Clement C. J. Webb's studies of the Mediæval Schoolmen, *Studies in the History of Natural Theology* (Oxford), belongs in the same class. Not primarily the work of philosophers, but certainly of interest to all students of the growth of human thought is the series on *The Mythology of All Races* (Boston), of which three volumes have appeared during the year: *Greek and Roman*, by William Sherwood Fox; *Oceanic*, by Roland Burrage Dixon; and *North American*, by Hart-

ley Burr Alexander. The series is to comprise thirteen volumes, under the general editorship of Louis H. Gray and George Foot Moore.

But while political and religious speculations have occupied the foreground during the year, it must not be assumed that the more rigorous and "tough-minded" realm of pure abstraction has been altogether neglected. One of the interesting and indeed touching experiences of the year is to take up a copy, say, of the *Revue de Métaphysique et de Morale*, and find it devoted wholly to logical and abstruse discussions, with no hint of near catastrophe. It is quite probable, in fact, that the same need which leads some minds to seek in religious thought escape from disappointment with humanity leads others, quite as inevitably, to the dry impersonality of precise logic and the high sphere of the supralunar. Striking, too, is the predominance of methodological over constructive thinking: the mathematical certitudes of form rather than the temerity of cosmic adventure appeal to a day and generation when men are too intimately neighbored to passion to feel much confidence in their powers of perspective. After the logical interest, manifested widely in the periodicals, the resurgence of pragmatism is the conspicuous fact; for, on the book side at least, 1916 has been a pragmatic year. Doubtless the most noticed book is John Dewey's *Essays in Experimental Logic* (Chicago), the nucleus of which is Professor Dewey's contribution to *Studies in Logical Theory*, now out of print. John E. Boodin, *A Realistic Universe* (New York), is a further elucidation of this author's "pragmatic realism"—in which phrase the stress belongs on the adjective—and is an effort at a thorough philosophic synthesis, rigorously metaphysical. The English translation of Emile Boutroux's pragmatic interpretation of natural law, *The Contingency of the Laws of Nature* (Chicago), deserves note in this connection; while there is surely some pragmatic implication in the very title of Cassius J. Keyser, *The Human Worth of Rigorous Thinking* (New York). The year has brought us also the interesting promise of a protagonistic volume of pragmatic essays in answer to the similar pronouncement issued a few years since by the Neo-Realists. It must not be assumed that the latter group is quiescent: while the Western Philosophical Association has devoted most of its attention to the philosophy of the state, the National Association is still in the hands of the Realists, hammering away at the old problem of "mental," or "psychical," versus "physical" entities.

Of over-seas books, from the Continent, there has been almost an entire dearth. Books and periodicals alike published in the Teutonic nations have been held up by the blockade; Belgian publications were cut short two years ago; while in all the belligerent countries the business of thinking has necessarily been subordinated to the all-engrossing business of fighting. Indeed, one could hardly imagine a less opportune period for publishing an abstruse book. The wonder is that the periodicals from the Latin countries hold out so well as they do. Many have ceased to come, but such recognized and capable journals as the *Revue Philosophique*, the *Revue de Métaphysique et de Morale*, the *Rivista di Filosofia*, regularly appear—thinned and diminished in form, but resolutely austere and philosophical in tone. Little things show the pres-

sure of the times. The *Revue de Métaphysique et de Morale* publishes on its cover the announcement that the supplement devoted to reviews is discontinued "owing to the small number of publications concerning philosophy." *Scientia*, which is polyglot and formerly had numerous contributions in German, now publishes only in English, French, and Italian. But for all this the feeling for philosophy and the philosophical tradition is only quiescent *outré-mer*. It is a fine thing to see the *Revue de Métaphysique et de Morale* devoting its initial number of the year to the bicentenary of the death of Malebranche, and to see on its page of contents many of the most eminent names in French philosophy. In our own country *The Monist* devotes an issue to the bicentenary of Leibnitz's death—and one cannot but reflect that to these two philosophers, the Frenchman Malebranche and the German Leibnitz, so closely related in philosophical inspiration, both France and Germany owe a common debt. Two other special issues mark the periodical world. The last issue of the year of *The Journal of Philosophy, Psychology and Scientific Method* is devoted to the memory and works of Charles Sanders Peirce; while for its May number *The Philosophical Review* published a volume comprising the "Papers in Honor of Josiah Royce on his Sixtieth Birthday." Certainly it is a matter of gratification that this honor fell in Professor Royce's lifetime. Two new publications have made their appearance in the United States during the year.

On the side of necrology the year has been serious. The death of Josiah Royce (q.v.) in September deprived Harvard of its most eminent teacher and America of an international figure in philosophy. Another deprivation for Harvard came with the sudden death of Hugo Münsterberg (q.v.), who fell from his chair just after completing a lecture to his Radcliffe class on December 16th and died a few minutes later. Professor Münsterberg was but in his 54th year and was seemingly in the fullness of his powers. Since the outbreak of the war he had been an active defender of the cause of the Central Powers, and it is altogether possible that the strain of the international conflict hastened his death. To a similar cause, in part at least, is assigned the death on June 16th of Victor Delbos (1862–1916), almost of an age with Münsterberg. He was seized with an acute illness, and, says the *Revue de Métaphysique et de Morale*, "when the malady came, his organism was exhausted by the anguish of evil days and the grief of seeing death strike down with repeated blows his most beloved pupils." Delbos was one of the most beloved of the teachers in the University of Paris. His work in philosophy had been chiefly the exposition of the German idealists, especially Kant, but in the midst of the bloody conflict he could no longer endure to read his familiar authors and had turned for consolation to the study of French philosophy. It is a curious irony that Germany should thus count among her French victims perhaps the greatest contemporary disciple of Kant.

December 31st was marked by the death of George H. Howison (q.v.), who began his work as a teacher of philosophy in the Massachusetts Institute of Technology, while its culmination lay in the long period of his activity at the University of California from 1884 onward. Professor Howison was one of the few remain-

ing of the band of men who gave eminence to American philosophy in the latter part of the nineteenth century, changing the color of its thought and the form of its method from those of theology to those of science. His death marks the end of a year which, in all likelihood, future historians will regard as the close of an epoch not only in the speculative thought of America, but in that of the whole world. See also ITALIAN LITERATURE.

**PHONETICS.** See PHILOLOGY, MODERN, *Phonetics*.

**PHOSPHATE.** The phosphate rock marketed in the States in 1915 amounted to 1,335,667 long tons, valued at \$5,513,449, compared with 2,734,043 long tons, valued at \$9,608,041 in 1914, a decrease of nearly 33½ per cent in quantity, and nearly 44 per cent in value. The disproportionate decrease in value was produced by the fall in the average price per ton. The phosphate rock industry during 1915 was in poor condition, especially in Florida. Shortly after the outbreak of the war in Europe the phosphate mining companies of Florida either curtailed production very materially, or suspended mining altogether. Shipments of phosphate rock to Germany, which hitherto had been a large consumer, had almost entirely ceased, and those to other European countries had been seriously interrupted. Business was greatly retarded during the year by the lack of steamers, and by increased freight rates. The great demand for sulphuric acid, especially toward the end of 1915, was also a factor in reducing the production of domestic phosphate rock. Prices for acid ranged so high that the manufacture of acid phosphate declined. The phosphate rock mined in the United States comes from Florida, South Carolina, Tennessee, and small quantities from certain of the Western States. Florida produces by far the largest quantity. The production of 1915 was 1,358,611 long tons, valued at \$3,762,239, or 74 per cent of all the phosphate rock produced in the United States. The production in Tennessee in 1915 was 309,759 long tons, valued at \$1,327,747. This was a decrease of about 20 per cent over the production of 1914. There were imported to the United States in 1915, 72,848 tons of fertilizer, valued at \$1,535,860. See FERTILIZERS.

**PHOSPHORIC ACID.** See FERTILIZERS.

**PHOTOELECTRIC EFFECT.** See PHYSICS.

**PHOTOGRAPHY.** Developments of the year in photography were neither numerous nor startling. There was steady improvement in the usefulness and efficiency of cameras, especially since war conditions encouraged the greater perfection of these devices by domestic manufacturers. Many ingenious applications of photography were recorded which, while showing new uses of photographic art, yet involved no particularly new idea in the cameras or films. The demands for readily portable photographic devices for military use were met by the construction of several new types for aeronautic purposes. Others for use by naturalists in the photography of birds and other wild game were brought to a high state of perfection, and highly artistic results were secured by them. Not the least noticeable feature of the year was the steady improvement in the quality of pictures submitted by amateurs in many newspaper and other competitive contests. Researches in the realm of color photography were prosecuted with great

interest by many investigators, and at least one manufacturer of cameras and photographic supplies placed on the market a highly satisfactory equipment to enable amateurs to make colored photographs. Some interesting results were secured in textile manufactures in the successful color printing of fabrics by means of the three-color photographic process, and while the difficulties incidental to correct registration of the three sets of plates were apparently very great, they were not considered to be insurmountable, and it was confidently expected that this process would be much more widely used in the near future.

As had been done with moving picture photography as mentioned in the 1915 YEAR BOOK, results of constantly increasing excellence were obtained in under-water photography, employing a simple camera. Although attention is more commonly directed to the use of the moving picture camera in glass chambers under water, yet a great deal of good work has been done, and in many cases with more satisfactory results, particularly in the study of submarine flora, with the ordinary camera.

The year was unusually devoid of any important decisions in cases in litigation. While several cases of general interest were still in the courts, no decisions of an important nature had been rendered at the close of the year.

Manufacturers of cameras in the United States were striving to improve the quality of glass employed for lenses, since war conditions, by cutting off the European supply of such materials, had made a serious shortage that it was difficult to meet. Both amateurs and professionals were largely affected by the great increase in the market price of all photographic materials for this same reason, added to which the availability of many manufacturing plants for producing chemicals other than those used in photography served to make it increasingly difficult to obtain supplies in reliable quantities. In medical and surgical work the improved results in radiographic examination were due quite as much to improvements in the plates sensitized for this purpose as to the better construction of X-ray tubes. In this connection a much faster plate was used by leading radiologists so as to obtain a clear picture with a minimum time of exposure, and consequently decreased inconvenience to the patient.

It was noticeable that amateurs were making a constantly wider use of devices, such as ray screens or filters, to enable them to obtain more correct color values, especially in landscape work. Some of the portrait work done by amateurs was also regarded as being of the highest class and well worthy of mention. See ASTRONOMY; CHEMISTRY, INDUSTRIAL.

**PHOTOMETRY.** See PHYSICS.

**PHOTO-PLAYS.** See MOVING PICTURES.

**PHYSICAL CHEMISTRY.** See CHEMISTRY, GENERAL.

**PHYSICS.** The increasing demands of the war were felt in the domain of physics very keenly and one of the net results was that the published work of German and English physicists was relatively of less importance in 1916 than in previous years. The large amount of work published in the United States was due not alone to the increased activities of American universities and the many valuable contributions from the National Bureau of Stand-

ards. Research laboratories connected with industrial organizations such as the General Electric Company, the National Electric Lamp Association, or the United Gas Improvement Company carried on very important investigations. Naturally most of this industrial scientific research was directly prompted by some commercial need. At the same time, the men carrying on these researches were among the best trained of American scientific investigators. The chief difference between the work at these laboratories and that carried on at the universities often seemed to be that in the former case the investigator had larger facilities. On the other hand, one of the most enthusiastic and prolific groups of workers consists of Prof. R. A. Millikan and his associates and students. Their work will be discussed in some detail in later paragraphs.

**THEORETICAL PHYSICS.** It is difficult to scan a single number of any of the standard periodicals dealing with physics without finding at least one article on some phase of the *Quantum Theory*. A general outline of this was given several years ago in earlier YEAR BOOKS (1910, 1911, and 1912), and more than one reference occurs in this article. As originally stated by Planck, the *quantum theory* was based on certain assumptions, some of which at least seem questionable, and many attempts have been made to give it a (seemingly) more sound theoretical basis. Such papers cannot be reviewed in brief, and a mere enumeration of authors and titles for 1916 would be without purpose here. A similar remark applies to the contributions on *relativity theory*. Further reference to *quantum theory* will be found in connection with the discussions of *Photoelectric Effect* and of *X-Rays*. The remarkable agreement of the values for "h" deduced by Millikan from measurements on the photoelectric effect and by D. L. Webster from X-ray data should be noted.

**PHYSICAL PHOTOMETRY.** The task of increasing the accuracy of our knowledge of some physical constant or of improving a method of measurement may be very important, but it hardly appeals to the imagination as does research in newer fields. But the results of the increasing demands of modern illumination for the perfecting of the *art* of accurate photometry furnished an excellent illustration of the way in which commercial research—so called—often leads to valuable results of general scientific interest. To make photometry exact two primary requirements have to be met: First, an accurately reproducible standard "lamp" must be designed. Second, the errors due to individual judgment, defects in the eye, fatigue, etc., of the person making the photometric comparison must be eliminated.

To meet the first of these needs much work had been done on light sources and on the "mechanical equivalent of light." This in turn led to detailed studies of the relation between the *luminous* energy given off by a *black body* and its temperature. It is unnecessary here to enumerate in detail the work of the individual investigators. Ives, Kingsbury, Karrer, Langmuir, Foote, and Fairchild were among those who contributed in this field.

The second requirement has introduced many interesting questions. It has been necessary to determine just what effect is produced on the average eye by the luminous energy from a given

source. This problem has its physiological and psychological as well as its physical aspects, many of the errors in photometry lying outside the domain of physics. The difficulties were largely overcome by the work of Ives and his associates. Two or three years previously they had succeeded in giving a satisfactorily exact definition to what might be called an "average eye." That is, by averaging the results obtained by a number of carefully chosen observers they obtained an accurate measure of the luminous value to be assigned to energy of each wave-length (color) throughout the visible spectrum. This luminous value is *not* proportional to the total amount of energy of that wave-length. The next step, therefore, was to devise suitable filters to transmit the *energy* of a given wave-length in exact proportion to its *luminous* value. The problem of photometric comparison is then reduced to comparing the total amounts of "filtered" energy from the two light sources. This makes it possible to substitute for the eye some form of energy-measuring instrument, such as the thermopile or the photoelectric cell, thus eliminating the physiological and psychological difficulties.

It must not be assumed that this summary is confined to the results obtained in 1916, or that these have been discussed in strictly chronological order. For example, the investigations on the average eye and luminous values were essential to some of the work on black body sources. However, this seems to be a fitting time to summarize the progress made thus far. More than a score of papers dealing with this work appeared during the year 1916 and a satisfactory solution of the original problem seemed close at hand. Fortunately this does not mean that all the problems suggested by the investigations had been solved, for more than one apparently minor investigation had proved unexpectedly fruitful. The 1916 volumes of the *Physical Review* and the *Journal of the Franklin Institute* should be consulted for further details.

**RADIATION LAWS AND HEAT.** The exact numerical values of the several constants occurring in the equations giving the laws of black body radiation are of importance for reasons aside from the work on photometry. The revolutionary conclusions to which the *quantum theory* leads emphasize the importance of verifying it quantitatively in every way possible. For these calculations, accurate values of the radiation constants are absolutely essential. The growing importance of *accurate* optical pyrometry makes similar demands. For a number of years Coblentz, of the Bureau of Standards, had been studying problems connected with radiation, and during the year published revised values for several of these constants. (*Bulletin Bur. of Stds.*, vol. xii, pp. 503-551, 553-582; vol. xiii, pp. 459-477, 1916—*Scientific Papers*, 261, 262, and 284.) Needless to say, this work represents experimental investigation of the highest order. To appreciate the painstaking attention to detail which is involved, the original papers must be consulted. Measurements on the constant of the Stefan-Boltzmann law in the range 20°C. to 450°C., in substantial agreement with Coblentz, were published by Gerlach. (*Ann. d. Physik*, 50, 3, pp. 233-269, 1916.)

About the middle of 1915, R. W. Wood described a series of ingenious experiments on what

he called a "one-dimensional gas." As is often the case with Wood's striking experiments, the apparatus itself was very simple, consisting of a long, narrow glass tube with a constriction at one end, beyond which a bulb was blown. The other end terminated in a small bulb, at an angle to the tube, into which a drop of mercury was sealed. The apparatus was suitably exhausted. When the mercury was heated gently and the remainder of the apparatus was suitably cooled in liquid air, the narrow stream of mercury vapor which penetrated the bulb at the other end consisted of molecules all of which were moving in the same direction. To such a stream of molecules it is obvious that many conceptions of the kinetic theory of gases do not apply. The original purpose of the experiments was to study the law of reflection of the molecules, and Wood concluded that when reflected from polished glass, the distribution followed the cosine law. Later experiments by Wood on cadmium vapor and by Knudsen on mercury vapor showed that the temperature of the reflecting surface exerts a marked influence on the whole phenomenon. For example, if a stream of mercury molecules falls on a glass surface at a temperature of  $-130^{\circ}$  to  $-140^{\circ}$  C. or lower, none will be reflected; if the surface is slightly above this temperature they will be reflected according to the cosine law. (*Phil. Mag.* 30 pp. 300-304, 1915; 32 pp. 364-371, 1916. *Ann. d. Physik* 50, 4, pp. 472-488, 1916.)

Langmuir criticised Wood's interpretation of the phenomena observed. In a very careful and exhaustive article (*Phys. Rev.*, pp. 149-176, Aug., 1916), he advanced the explanation that the molecules *always* condense upon striking the surface. If the surface is at a sufficiently high temperature they then reevaporate at a rate depending only upon the temperature and the degree of exhaustion of the bulb.

**PHOTOELECTRIC EFFECT.** The application of photoelectric cells in physical photometry has already been mentioned. A very sensitive and satisfactory form of cell for photometric work on the stars was developed by Kunz and Stebbins. (*Phys. Rev.* 7, pp. 62-65, 1916.) Some years before (see 1911 YEAR BOOK) Pohl and Pringsheim called attention to two classes of photoelectric effect in the case of the alkali metals—the "normal" and the "selective" effects. The selective effect is produced by light of certain wave-lengths polarised in the plane of incidence, and they suggested that there was a radical difference in the respective mechanisms involved. This was later questioned by A. L. Hughes. He found that in a sodium-potassium alloy the number of electrons emitted in the selective effect was approximately 26 times the number in the normal effect, but the ways in which they were emitted were practically the same and there was no evidence of any fundamental difference in the mechanisms involved.

In studying lithium, sodium, and potassium, Souder obtained results which suggest the *selective* effect, although the conditions were such that, according to Pohl and Pringsheim, the *normal* effect was to be expected. This may be due to the fact that the surfaces used were cut with a razor edge in vacuo, thus giving a mirror-like surface.

One of the causes for the discordant results obtained by different observers was suggested by

the work of Piersol. In the case of palladium, platinum, gold, nickel, and silver he found that repeated heatings are necessary to drive off the occluded gases. This was accompanied by an increase in the photoelectric sensitiveness. Robinson, in studying thin films of platinum, found that films whose thickness is approximately  $10^{-7}$  cm.—about one twenty-five millionth of an inch—are especially sensitive.

The work of Millikan and his associates has been mentioned. It is no exaggeration to say that Millikan's two papers on "Einstein's Photoelectric Equation and Contact E.M.F." and "The Direct Photoelectric Determination of Planck's 'h'" (*Phys. Rev.* 7, pp. 18-32, Jan., and pp. 355-388, Mar., 1916) were among the most notable contributions of recent years. The second paper is really a continuation of the first. The experimental work demanded great skill and ingenuity, and the theoretical interpretation of the results is most illuminating. The apparatus has been aptly described as a "machine shop in vacuo." It made possible "The removal in vacuo of all surface films from all surfaces; the measurement of the photo currents and photo potentials due to these film free surfaces; the simultaneous measurement of the contact e.m.f.'s of the surfaces." No adequate review of the experimental details nor of the theoretical arguments is possible within brief limits. The following excerpts—the first two sentences of the first article and the last two sentences of the second—are suggestive, but the original articles should by all means be consulted:

"Einstein's photoelectric equation for the maximum energy of emission of a negative electron under the influence of ultra-violet light, namely

$$\frac{1}{2}mv^2 = Ve = h\nu - p^*$$

cannot in my judgment be looked upon at present as resting upon any sort of satisfactory theoretical foundation. Its credentials are thus far empirical, but it is an equation which, if correct, is certainly destined to play a scarcely less important rôle in the future development of the relations between radiant electromagnetic energy and thermal energy than Maxwell's equations have played in the past" (p. 18).

"Einstein's photoelectric equation has been subjected to very searching tests and it appears in every case to predict exactly the observed results. Planck's  $h$  has been photoelectrically determined with a precision of about 0.5 per cent and is found to have the value  $h = 6.57 \times 10^{-27}$ " (p. 388).

Millikan's associates, especially Kadesch, Hennings, and Souder, have extended this work.

The term "complete photoelectric emission" is applied to the photoelectric effect produced on a hot body by the light which it itself emits. As might be expected, this follows a law similar to that for thermionic currents. An address by Prof. O. W. Richardson before the Manchester meeting of the British association gives a comprehensive discussion of this subject. (*Phil. Mag.* 31, pp. 149-155, Feb., 1916.)

GENERAL RADIOACTIVITY. Richards and Wads-

\*  $p$  = work necessary to get an electron out of a metal.  
 $\frac{1}{2}mv^2$  = energy with which it leaves the surface.  
 $V$  = the potential difference against which it can drive itself.

worth have continued the investigations of Richards and Lambert (see 1914 YEAR BOOK) on the atomic weight of lead of radioactive origin. In addition to very careful determinations of the atomic weight and density of ordinary lead, they have made identically similar determinations on specimens of Australian radio-lead and radio-lead separated from Norwegian cleveite. The densities of the samples of radio-lead are 11.288 grams per cubic centimeter and 11.273 grams per cubic centimeter, respectively, while that of ordinary lead is 11.337 grams per cubic centimeter. The differences in density exactly parallel the differences in atomic weight, and indicate that the respective atomic volumes of these isotopes are almost exactly equal. If further confirmation were needed of the relationship of lead to radium it is furnished by the work of v. Hevesy and Paneth. A large amount of radium emanation was allowed to decay for several weeks in a quartz bulb and the deposit of radium D thus formed was dissolved in nitric acid. Various tests comparing the e.m.f.'s given by this solution and by a similar solution of lead gave identical results.

From time to time attempts have been made to influence the rate of radioactive transformations by employing extremes of temperature, pressure, high electric and magnetic fields, etc. Such attempts have always given negative results. This was to be expected in many cases, since temperature or compression, for example, are distinctly *molecular* influences. Something essentially *atomic* or *sub-atomic* is needed. Danysz and Wertenstein suggested that exceptionally great atomic shocks such as those produced by the impact of a particles might affect the rate of radio-active transformation. Their experiments, however, gave absolutely no trace of any such effect. The student of radioactivity was still in the position of one who watches and studies a complicated performance which he is powerless to influence in any way.

Wertenstein also made an important contribution to our knowledge of radioactive recoil. The early work of Makower and Russ had indicated that the recoil atoms carried a positive charge. From a series of very careful tests in high vacua Wertenstein concluded that the atoms of radium D recoiling from radium C were *not* charged at the instant of their production. However, as the gas pressure increases, these recoil atoms acquire a positive charge which gradually increases, eventually becoming equal to or even exceeding the charge carried by an a particle.

For some years it had been accepted that the disintegration of thorium C takes place in two distinct ways, about one-third of the atoms producing a particles of range 5.0 cm. in air, while the other two-thirds produce a particles whose range is 8.6 cm. This was studied in considerable detail by Marsden, Darwin Barratt, Fajens, and others. Rutherford and A. B. Wood discovered that the process of disintegration of thorium C was even more complicated. (*Phil. Mag.* 31, pp. 379-386, April, 1916.) About one ten-thousandth of the total number of a particles were emitted with extremely high velocities. About one-third of these have a range of 10.2 cm. while the others penetrate 11.3 cm. These ranges correspond to velocities far higher than had ever before been observed for

a particles, and the presence of a particles of four different speeds indicated that the disintegration of thorium C is an exceedingly complex process.

Caruthers called attention to an interesting relation in the case of the substances which emit  $\alpha$  particles. When the logarithm of the range of the  $\alpha$  particle is plotted against the logarithm of the atomic weight of the element emitting it, the points corresponding to each group of isotopes give a straight line. Moreover, the lines for the various groups are approximately parallel and equally spaced. From this he concluded that the range of the  $\alpha$  particles was universally proportional to approximately the twenty-first power of the atomic weight of the substance emitting it. Similar relations for the constants of  $\beta$  and  $\gamma$  rays were also deduced. Caruthers's article appeared (*Nature* 96, pp. 565-566, Jan. 20, 1916) some months before the work of Rutherford and Wood; apparently it would be difficult to fit thorium C into such a scheme as Caruthers suggests.

An excellent summary of the important work on radioactivity for the years 1914 and 1915 was made by G. L. Wendt. His paper includes a comprehensive table of the most recent values of the various radioactive constants. (*Phys. Rev.* 7, pp. 389-393, Mar., 1916.)

**SPECTRUM WORK AND GENERAL DISCHARGE IN GASES.** In the 1915 YEAR BOOK considerable attention was devoted to the work—both theoretical and experimental—on series spectra, especially those of hydrogen and helium. While the year 1916 witnessed several contributions along these lines, there were many important points which were still obscure. McLennan and his associates extended their work on the single line spectra of metals (1915 YEAR BOOK) to include magnesium vapor. Electrons which traverse magnesium vapor with an energy corresponding to a potential difference of 4.28 volts give the single line 2852.22 Å. U. This value for the "ionizing potential," like those for mercury, zinc, and cadmium, is in agreement with the quantum relation  $Ve = h\nu$ . The absorption spectrum of non-luminous magnesium vapor consists of the two lines 2852.22 Å. U. and 2026.46 Å. U.—the first and second members of the series.

The attempt to explain the single line spectra of mercury, zinc, cadmium, and magnesium on Bohr's theory of the structure of the atom leads to the conclusion that, if this theory is correct, Franck and Hertz and Newman misinterpreted their results on ionizing potentials. On studying ionization in flames McLennan found that when mercury vapor is fed into a bunsen flame it is ionized and radiates the line 2536.72 Å. U.; zinc vapor is not ionized and does not emit any of the characteristic spectrum of zinc; cadmium does not seem to be ionized but a weak flame gives the line 3260.17 Å. U., while in a strong flame the line 2288.79 Å. U. is added; magnesium is ionized and gives the line 2852.22 Å. U.; and thallium is strongly ionized, giving the lines 5350.65 Å. U. and 3775.87 Å. U. These results certainly are not conclusive either as supporting or as definitely invalidating Bohr's theory. At the time of writing, the whole question of ionization potentials seemed to be in a very uncertain state. (The work from McLennan's laboratory was published

chiefly in the March and October issues of the *Proceedings of the Royal Society.*)

Questions concerning the hydrogen and helium spectra mentioned in the 1915 YEAR BOOK still seemed far from solution. Evans and Croxson have made a further study of the line 4686 which, according to Bohr's theory, belongs to the helium spectrum. With the form of tube which they used, the ordinary helium lines were very intense. This line was comparatively faint but it was very sharp and its structure in general agreed with theory. On the other hand, Richardson and Bazzoni found that the spectrum of helium could be produced under conditions which directly contradict Bohr's theory.

In 1907 R. W. Wood showed that the principal series of sodium is much more complete when observed as an absorption spectrum than when studied as an emission spectrum. The earlier work gave a total of 48 lines in this series. Quite recently, at Zurich, Wood and Fortrat made a further study of this series. Thanks to the use of a very powerful quartz spectograph, giving the equivalent of 13 60° prisms, they were able to observe 10 new lines at the head of the series. The first seven lines were found to be doublets. The results agree closely with the requirements of Ritz's formula. An idea of the difficulties of this work can be gained from the statement: "The last 32 members cover a spectral range not wider than the distance between the D lines."

Wood and Kimura made a further study of the resonance in mercury vapor. (For earlier work see 1912 YEAR BOOK.) They found that the scattered resonance radiation from a quartz bulb filled with vapor decreases rapidly with increased pressure and is gradually replaced by absorption; when the pressure reaches about 10 cm. regular (specular) reflection begins. The theoretical phases of resonance spectra are discussed by Silberstein in the September number of the *Philosophical Magazine*.

**X-RAYS.** The work on high frequency spectra, initiated by Moseley (1914 YEAR BOOK), was continued and extended during 1916 by Siegbahn and his associates. Moseley's work, it will be recalled, showed that only three elements remained undiscovered between aluminum and gold. By extending the work from gold to uranium Siegbahn and Firman demonstrated that we might expect to discover six new elements between bismuth and thorium and one between thorium and uranium. This last conclusion was confirmed by some recent work of de Broglie. In their work on the "K-series" of the elements from sodium to cerium, Siegbahn and Stenström obtained results which confirm Moseley's earlier work, the small discrepancies being due, in all probability, to slight uncertainties in the exact values of the  $\lambda$ . Their papers gave excellent tables of wave-constants upon which the calculations are based. lengths of these characteristic radiations. (*Phys. Zeitschrift* 17, pp. 17-18, 48-51, and 318-319, 1916; *Phil. Mag.* 31, pp. 403-406, 1916.) Siegbahn and Firman investigated the "L-series" for a number of elements including polonium, radium, and thorium. (*Phil. Mag.* 32, pp. 39-49, 1916.)

Siegbahn further claimed the discovery of a new group of lines of longer wave-length—the "M-series"—in the high frequency spectra of

uranium, thorium, bismuth, lead, thallium, and gold. Since this radiation is very easily absorbed by the air, his apparatus consisted essentially of a spectograph in vacuo, using a gypsum crystal as the analyzer. He succeeded in measuring the wave-length of six of the lines of this series in the spectrum of uranium and detected several other more feeble lines. The spectra of the other elements were found to be similar to that of uranium. (*Comp. Rend.* 162, pp. 787-788, May 22, 1916.)

The frequent use of tungsten as the target in X-ray tubes lent considerable interest to the study of its spectrum. Values obtained by Gorton, using a Coolidge tube and stationary crystals of rock-salt and calcite, agreed with earlier work by de Broglie but were uniformly lower than those published by Barnes (1915). A. H. Compton devised a modification of the Bragg spectrometer which converts it into a convenient recording instrument. With this he "mapped" the seven lines already known in the spectrum of tungsten and found indications of at least six more. He also detected some evidence of polarization due to reflection by the crystal. (*Phys. Rev.* 7, pp. 646-659, 1916.)

The relation between the maximum frequency of X-rays emitted by a tube and the potential difference across it for voltages from 30,000 to 100,000 was investigated by A. W. Hull. Throughout this range he found the maximum frequency accurately proportional to the applied voltage, with no evidence of the frequency maximum at 145,000 volts which was reported by Rutherford. (See 1915 YEAR BOOK.) Duane recently showed that the method of measurement used by Rutherford—based on the absorption coefficient—did not, at high voltages, give the maximum frequency produced. Hull stated that "the maximum frequency for voltages up to 100,000 is given accurately by the quantum relation, and there is no reason to believe that it should not continue to increase with voltage indefinitely."

Another notable contribution connecting the quantum theory with X-rays was made by D. L. Webster. (*Phys. Rev.* 7, pp. 599-613, June, 1916.) He studied the radiation from a Coolidge tube with a rhodium target, using a calcite crystal and a modified Bragg spectrometer. An interesting feature of this investigation was the use of a battery of over 20,000 storage cells—giving from 42,000 to 44,000 volts—to excite the tube. The steady potential difference thus secured was of great advantage in giving strictly uniform conditions. From his results Webster computed the value of Planck's constant as  $h = 6.53 \times 10^{-27}$ —a remarkable agreement with Millikan's value.

The work of Barkla on absorption of X-rays taken with Moseley's table of wave-lengths shows that the coefficient of absorption of all metals for X-rays varies approximately as the cube of the wave-length, except in the immediate vicinity of one of the wave-lengths characteristic of the metal. Though the experimental data cover the range 4 Å. U. to 0.5 Å. U., this relation has often been extrapolated to use as a measure of very short wave-lengths. Recent work by Hull and Rice on the absorption of X-rays by aluminum, copper, and lead showed the conditions under which such extrapolation was justified. Their measurements cover the range from 0.4 Å. U. to 0.1 Å. U. When a

beam of X-rays is absorbed, some of the energy is reëmitted as radiation of the same wave-length as the incident beam; this is the "scattered" radiation studied by Barkla several years ago. The remainder of the absorbed energy is transformed into energy of a different form or a different wave-length, i.e. heat, fluorescent radiation, etc., etc. Barkla's earlier work showed that the coefficient of scattering per unit mass is independent of the wave-length. By making a constant correction for this, Hull and Rice showed that the "corrected absorption coefficient" or "transformation coefficient" was directly proportional to the cube of the wave-length.

The absorption coefficient of soft X-rays produced at voltages below 10,000 was studied by C. D. Miller. His results in general agree with those of Siegbahn obtained in 1915.

Vegard, using a Bragg spectrometer, found that the atomic structure of crystals of silver, copper, gold, and lead was a face-centred cubic space lattice. Forman has shown that by magnetizing iron in a direction parallel to the path of X-rays, its opacity is increased.

From time to time since X-rays were first discovered, attempts have been made to detect some evidence of refraction when they pass through matter. Before their true nature was established by the work with crystals (see 1913 YEAR BOOK), these attempts were haphazard. In a recent article (*Phil. Mag.* 31, pp. 257-260, April, 1916), Barkla shows that if the usual simple theory of dispersion, applicable to radiation of longer wave-length, applies also to X-rays, it is just possible that some evidence of refraction might be detected. He emphasizes the point that an *optically plane* surface is really quite *rough* in comparison to the wave-length of X-rays. Therefore, for his experiments he used 90° prisms of potassium bromide, the faces of which were crystalline. He used two prisms placed one above the other with their bases in opposite directions. Half of a very narrow parallel beam of homogeneous X-rays passed through each prism. In this way any deviation would be doubled. Though his apparatus was capable of detecting as little deviation as 2 seconds of arc, absolutely negative results were obtained. A somewhat similar attempt by D. L. Webster and Harry Clark to detect refraction gave similar negative results. (*Phys. Rev.* 8, pp. 528-533, Nov., 1916.) These very careful experiments were of interest not only in connection with X-rays but also as showing the limitations of our present theories of dispersion.

NOTABLE LECTURES. The preceding paragraphs give only the most important of the recent advances in this most fascinating field. The reader who desires a more comprehensive review will do well to refer to the reports of several recent lectures. Notable among these are the Bakerian Lecture "X-Rays and the Theory of Radiation" by Barkla (abstract in *Roy. Soc. Proc. A* 92, pp. 501-504, Aug., 1916); Sir J. J. Thomson's lecture before the Royal Institution on "Genesis and Absorption of X-Rays" (*Engineering*, 101, pp. 406-407, 1916); and "Recent Work on X-Rays and Crystals and Its Bearing on Chemistry" by W. H. Bragg (*Chem. Soc. Trans.* 109, pp. 252-269, 1916).

MISCELLANEOUS CONTRIBUTIONS. The attempt to give a rigorous explanation of some one of

the very common phenomena of nature often results in showing how very little is really known about matters which are usually taken for granted. Every surveyor is familiar with the diurnal fluctuations of the earth's magnetism. In 1908 Schuster attempted to account for these variations by a theory which assumed that the upper atmosphere is a region of high electrical conductivity—an assumption in favor of which there is certainly much evidence. The ultra-violet radiation from the sun is a possible source of this ionization. However, on attempting to compute the magnitude of this effect Swann finds that the conductivity of this region is only about  $\frac{1}{1000}$  of the value required by Schuster's theory. (*Terrest. Mag.* 21, pp. 1-8, Mar., 1916.) Of course, as he points out, the values in the calculations may be in error. Thus, if the pressure were less than the value assumed, the conductivity would be increased. But it is obvious that at present this is not a quantitatively satisfactory theory.

The amount of electricity carried by an ordinary lightning flash has been estimated by C. T. R. Wilson as about 30 coulombs. (*Proc. Roy. Soc.*, 92 A, pp. 555-574, Sept., 1916.) W. J. Humphreys has made a very different estimate of the magnitude of the particular discharge which crushed a certain copper lightning conductor and fused it at the upper end. Assuming that the discharge lasted 0.01 second, a calculation based on the mean specific heat of copper gave the average current the enormous value of 90,000 amperes, with a crushing pressure due to the "pinch effect" of 400 pounds per square inch.

Some conclusions which were put forward by Shaw concerning the effect of temperature on the constant of gravitation seemed rather staggering. (*Roy. Soc. Phil. Trans.* 216, pp. 349-392, May 27, 1916.) In most of the classical determinations of this constant, great care had been taken to insure constant temperature in order to avoid possible errors due to unequal expansion, air currents, etc. Moreover, in such work as that of Poynting and Phillips (1905), where an attempt was made to detect a temperature effect, the attraction was measured between a small mass and the earth. It was therefore impossible to alter the temperature of both bodies. In Shaw's experiments, which extended over several years, a torsion balance of the Cavendish type was used. The temperature of both large and small attracting masses was varied from 15° C. to 250° C. The author's conclusion is that instead of the familiar equation

$$f = G \frac{M m}{d^2} \text{ we should write } f = G (1 + a t) \frac{M m}{d^2}$$

where  $a$  has the value  $1.20 \pm 0.05 \times 10^{-5}$  per degree Centigrade.

As might be expected, the publication of Shaw's paper aroused much comment. Larmor, Barton, and others have pointed out many unquestioned facts which seem to contradict Shaw's conclusions. For example, the neglect of the temperature effect would introduce errors of such magnitude in certain astronomical calculations as to render them wholly unreliable. The outcome of this discussion was awaited with interest.

The influence of the war is manifest in many ways aside from the fact that it had stripped the European laboratories of some of their best

men. Numerous observations on the propagation of intense sounds at great distances were published. The precision required of modern artillery resulted in several investigations on the motion of solids through resisting media. The fact that modern long range shells travel for a part of their trajectory through the very rarified upper atmosphere led to the revision of many tables of ballistics. While work of this nature is to be anticipated, one would hardly expect that it would be published as scientific research in such periodicals as the *Proceedings of the Royal Society*. (See for example, No. A 640 pp. 329-337, April, 1916.) Some results are certainly surprising. For example, it was pointed out by de Sparre that a rise in temperature of less than 25° F. and a drop in the barometric pressure of less than half an inch may result in increasing the range of a large gun by over a mile.

In earlier articles on Physics in the YEAR BOOK, comment has been made upon Dr. Gaede's contributions in inventing pumps for the production of high vacua. The best of his inventions, however, was surpassed by pumps perfected by H. B. Williams (*Phys. Rev.* 7, pp. 583-584, May, 1916) and Langmuir (*Phys. Rev.* 8, pp. 48-51, July, 1916); *Jour. Franklin Inst.* 182, 6, pp. 719-743, Dec. 1916). These pumps, though developed independently, are essentially the same. A general idea of their action is given by this quotation from the second of Langmuir's articles: "Two new types of condensation pumps are described, one built wholly of glass and the other wholly of metal. In these pumps a blast of mercury vapor carries the gas into a condenser . . . the gas to be exhausted is caught by the blast of vapor and is forced by gas friction to travel along a cooled surface. By maintaining this surface at such a low temperature that the condensed mercury does not re-evaporate at an appreciable rate, it is possible to keep the vapor from escaping into the vessel being exhausted. . . . The condensation pump is characterized by extreme speed, by simplicity and reliability, and by the absence of a lower limit (other than zero) to which pressure may be reduced."

On the usually accepted theory that an electric current in a conductor consists of a motion of "free" electrons, it follows that an electric charge should be manifested when a conductor is accelerated or when it is subjected to the action of centrifugal force. It would be very difficult to detect the latter effect in solid conductors on account of the disturbing effects introduced by the inevitable sliding contacts, but it has been observed in electrolytes. Tolman and Stewart published an account of a study of the acceleration effect (*Phys. Rev.* 8, pp. 97-116, Aug., 1916). In these experiments about 510 yards of fine copper wire were wound on the rim of a wheel some 10 inches in diameter. This wheel was driven by a one and a half horse power motor at speeds up to 5000 r.p.m., giving linear velocities ranging from 60 to 190 feet per second. The wheel could be stopped in "a fraction of a second" giving accelerations of the order of 10 times that of a freely falling body. The coil was connected to a very sensitive ballistic galvanometer and the effect was measured by the "throw" of this instrument when the wheel was stopped. In order to guard against errors it was necessary to make the entire apparatus of non-magnetic material and to arrange various

auxiliary coils to neutralize the vertical and horizontal components of the earth's magnetic field. With these elaborate precautions, the results were in satisfactory agreement with theory and confirm the conclusion that conduction in metals consists in the drift of free electrons.

**PITRÉ, GIUSEPPE.** An Italian folklore scholar and antiquary, of Palermo, died in 1916. He was born in 1843, was early attracted to linguistic and archeological studies, and later became a great authority on the antiquities, traditions, dialects, and national songs of Sicily. He was one of the founders of the *Nuove Efemeridi Siciliane* (1868) and of the *Archivio per lo studio delle tradizioni popolari*. His most important work is the *Biblioteca delle tradizioni popolari siciliane* (19 vols., 1870-95). He also published *Curiosità popolari tradizionali* (10 vols., 1885-91) and *Bibliografia delle tradizioni popolari d'Italia* (1894).

**PITTMAN, KEY.** Relected Democratic United States Senator from Nevada, Nov. 7, 1916.

**PITTSBURGH, UNIVERSITY OF.** A non-sectarian co-educational institution at Pittsburgh, Pa., which in 1908 changed to its present name from that of the Western University of Pennsylvania. In 1916 there were enrolled 4076 students. The faculty numbered 451. In productive funds the institution had \$561,679, and drew an income of \$27,388. There were 23,000 volumes in the library. Chancellor, Samuel Black McCormick.

**PLANT BREEDING.** See BOTANY; HORTICULTURE.

**PLANT DISEASES.** See BOTANY.

**PLANT QUARANTINES AND REGULATIONS.** See HORTICULTURE.

**PLATINUM.** Platinum was produced in California and Oregon in 1915. The total production was 741 troy ounces, having a value of \$23,500. Most of the crude platinum came from California, only one mine in Oregon affording a production in 1915.

The world's production of platinum in 1915 was 143,145 troy ounces, compared with 216,548 in 1914. By far the largest part, 124,000 ounces, came from Russia. The total imports of platinum and allied metals into the United States in 1915 were 68,778 troy ounces, valued at \$2,768,688, compared with 76,810 troy ounces, valued at \$3,248,858 in 1914.

In 1916 platinum was indeed a rare metal owing to demands by the jewelry trade where it was needed for setting and to its industrial uses. A maximum price of \$105 per troy ounce was reached in late November and the average price for the refined metal in New York in 1916 was \$83.40 as compared with \$47.13 in 1915, \$45.14 in 1914, \$44.88 in 1913, \$45.35 in 1912, and \$43.12 in 1911.

The following figures by the United States Geological Survey give the best estimates from information available at the end of 1916, but are to be considered as but approximate:

ESTIMATE OF WORLD'S PRODUCTION OF CRUDE PLATINUM

Country	1913	1914	1915	1916
Borneo and Sumatra	200	200	*	*
Canada	30	50	30	100
Colombia	12,000	15,000	17,500	19,000
New South Wales	778	1,275	1,248	756
Russia	300,000	250,000	241,200	124,000
United States	721	483	570	742
	313,729	267,008	260,548	143,896

\* No basis for estimate. † No figures from Tasmania available at time report goes to press.

Platinum valued at \$504,302 was invoiced at the American Consulate at Cartagena, Colombia, for the United States during 1915, compared with \$357,519 worth for 1914.

In Russia the demand for home use, especially for acid work, was large, and the price for crude metal, high. In January the Russian government prohibited all holders of platinum—banks, mining companies, individual miners, dealers, jewelers, etc.—from selling or alienating in any way the metal which they held. The entire stock of platinum in Russia was to be requisitioned by the government at a price not then announced. This order, naturally, stopped all business in Russia. Later, the government rejected a proposal that all metals must be delivered to government offices as produced. The platinum that had already been taken over was bought by the government at a fixed price, but the subsequent production and market were left free, and with a confused market after the metal was released for export, sales were resumed on a rather small scale.

The Russian government having agreed to pay for the platinum taken at the price of 67,305 rubles per pood, prices on private sales rose to a corresponding level. With the government announcing an increased price the large companies in Russia renewed the development work at their properties, and two dredges were ordered for the platinum mines in the North Ural. There was a revival of the industry throughout the country, and with the increased demand there followed an increase in prices, and from Ekaterinburg it was reported that production had been reduced, owing to mobilization among the miners, which also helped the advance.

Although Russian dredging was proceeding to its fullest extent, at the end of the third quarter of the year the demand was sufficient to cause a further price increase.

See CHEMISTRY, INDUSTRIAL.

**PLATYHELMINTHES.** See ZOOLOGY, *Platyhelminthes*.

PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA.

The association was organized in Washington, D. C., in 1907. Since then the movement for playgrounds and neighborhood recreation centres for young and old has spread rapidly, statistics showing that during 1916 at least 480 cities conducted playgrounds and recreation centres under leadership. The cities reporting on expenditures stated that they had expended \$4,234,718.45. Many cities which have not already established year-

round systems of recreation headed by recreation secretaries or superintendents of recreation are now working with the assistance of the field secretaries of the association to put their recreation work on a permanent basis which will correspond with the school system.

Through the employment department of the association many officials have been enabled to select workers of training and experience. Communities not only in all parts of the country but also in foreign lands have been aided through correspondence. As a part of its educational and propaganda work the association publishes a monthly magazine, *The Playground*, and many pamphlets on all phases of recreation work. The officers of the association, which has headquarters at 1 Madison Avenue, New York City, are: President, Joseph Lee; first vice-president, H. P. Davison; secretary, H. S. Braucher; and treasurer, Gustavus T. Kirby. Theodore Roosevelt is honorary president.

**PLEASANT, RUFFIN G.** Relected Democratic Governor of Louisiana, Nov. 7, 1916. See LOUISIANA.

**PLUMMER, MARY WRIGHT.** An American librarian, died at Dixon, Ill., on Sept. 21, 1916. She was born in Richmond, Ind., and was educated at Wellesley College and Columbia University, where she was a member of the first class to study library science at that institution. She was librarian of the Pratt Institute Free Library, Brooklyn (1896-1904), and also director of the Pratt Institute Library School (1896-1911), and from 1911 until her death she was principal of the Library School of the New York Public Library. In 1915-16 she was president of the American Library Association, and in 1906 president of the New York State Library Association. She was a delegate from the United States to the International Congress of Libraries at Paris in 1900. Her publications include: *Hints to Small Libraries* (4th ed., 1911); *Verses* (1896); *Contemporary Spain* (1899); *Roy and Ray in Mexico* (1907); *Roy and Ray in Canada* (1908); *Stories from the Chronicle of the Cid* (1910).

**PODBIELSKI, VIKTOR A. VON.** A German general and public official, died in Berlin Jan. 25, 1916. Born at Frankfort-on-the-Oder in 1844, the son of Gen. Theophil Podbielski, he had a military training, served in the wars of 1866 and 1870-71, and by 1891 had risen to the rank of major-general. After 1893, when he entered the Reichstag, most of his attention was given to political affairs. In 1897 he was appointed postmaster-general and from 1901 to 1906 was minister of state. He was also minister of agriculture from 1901 to 1906. As postmaster, he organized the German telephone system and helped to bring Germany and the United States into direct communication by cable.

**POETRY.** See LITERATURE, ENGLISH AND AMERICAN; also articles on French, German, Italian, Russian, Scandinavian, and Spanish Literatures.

**POHL, HUGO VON.** A German naval officer, died in Berlin Feb. 24, 1916. He was born at Breslau in 1855. A lieutenant at 21, he later was lieutenant-captain of the corvette *Carola*, and captain of the cruiser *Hansa*. In 1900 he was present at the bombardment of the Taku forts, China. By 1905 he had risen to commodore, by 1909 to vice-admiral, and subsequently was admiral and chief of the admiralty

staff from 1909 to 1915. In February of the latter year he succeeded Admiral von Ingenohl as commander of the German battle fleet, a post he resigned because of ill health only a few days before his death.

**POILU.** A nickname for the French common soldier, in general use during the War of the Nations.

**POINCARÉ, RAYMOND.** See FRANCE, *History*.

**POINDEXTER, MILES.** Relected Republican United States Senator from Washington, Nov. 7, 1916.

**POISONING, INDUSTRIAL.** See OCCUPATIONAL DISEASES.

**POISONING, RHUS.** See RHUS POISONING.

**POLAND.** A former European kingdom, partitioned (in 1772, 1793, and 1795) between Russia, Austria, and Prussia. At the period of its greatest extent, the kingdom embraced the country now included in Livonia, Courland, Russian Poland, West Russia, a part of Little Russia, the East Prussian district of Ermland, West Prussia, Posen, and Galicia.

The term Poland is now commonly used for Russian Poland, occupied by the Germans in 1915. (See RUSSIA; WAR OF THE NATIONS.)

This, the most westerly portion of the Russian Empire, consists of nine governments, viz.: Kalisz, Kielce, Lomza, Lublin, Piotrków, Plock, Radom, Suwalki, and Warsaw. The latest *Annuaire statistique de la Russie* gives the area of these nine governments as 99,691.1 square versta (43,945.5 square miles). The estimated population Jan. 1, 1914, was 12,247,600 (6,149,200 males, 6,098,400 females). The rural population was estimated at 9,226,300, and the urban at 3,021,300. The population of the country as constituted at the time of the Russian census (1897) was 71.8 per cent Polish, 13.5 Jewish, 6.7 Russian, 4.3 Germanic, 3.3 Lithuanian. The Lithuanians are almost wholly in Suwalki, where in 1897 they formed 52.3 per cent of the inhabitants. About three-fourths of the people are Roman Catholic. In 1897 persons able to read were 305 (342 males, 268 females) per thousand. The largest city of Poland is Warsaw; its estimated population Jan. 1, 1914, was 909,491. The second city is Lodz, with over 400,000 inhabitants.

**POLAR RESEARCH.** The polar explorations of 1916 are almost entirely continuations of enterprises antedating the European war. Four expeditions were still in the field—those of MacMillan, Rasmussen, Steffánsson, and the Shackelton relief party. It may be added that at the end of the year no tidings had come from the Brusiloff and Rusanoff expeditions in the Siberian Ocean, but Russian authorities were offering rewards for information as to the fate of their members. While it is not within the scope of this article to reopen discussions as to the facts concerning the attainment of the North Pole, yet the subject of Polar Research is involved in two searching analyses of the documents published relative thereto, which have passed into permanent official records. These analyses, made by Congressman H. T. Hegelsen, form parts of the *Congressional Record*; that relative to Rear Admiral Peary on August 3rd, and that as to Dr. Cook on Dec. 21, 1916.

**ANTARCTIC.** It is many years since any polar venture has been marked, without loss of life, by experiences as varied and dangerous as those

of the two Antarctic expeditions of Sir E. H. Shackleton. His plans included the establishment of a temporary camp on Luitpold Land, Weddell Sea, in about 78° south latitude. From this base he was to lead a party across the unknown areas of the glacier-covered continent of Antarctica, where he was to be met at Ross Bay, Victoria Land, by a ship from Australia. Sailing from South Georgia Dec. 8, 1914, in the *Endurance*, after a voyage through ice-floes for 1000 miles Shackleton sighted on Jan. 10, 1915, Coats Land, but was unable to reach it. Later an unknown land, some 200 miles in extent, named Caird Coast, was discovered, from which enormous glaciers were discharging into the ocean. In February, 1915, the *Endurance* was inextricably beset by heavy floebergs and could neither advance nor retreat. Thenceforth her course was with the drifting pack, which carried her southwest to 77° S., 35° W., her extreme southing, and then in zigzag fashion to the northwest. From July onward the ship was almost daily threatened with destruction, and was finally crushed and sunk by overwhelming floes in 69° 05' S., 51° 32' W., on Oct. 27, 1915, 346 miles from the nearest northern land. Alternate efforts to travel north by sledge or by boat were fruitless, and the shipwrecked men established quarters on the slowly drifting pack for nearly six months, supplementing their food by dogs and occasional seals. March 27, 1916, the peaks of Joinville Land were sighted, and on April 7 they were near Clarence Island, the easternmost point of the South Shetlands. Their great floeberg was now broken up by strong swells, and they were forced to enter a heavy sea in their tiny boats—having drifted 700 miles. After 10 days of arduous and dangerous ice-navigation they landed on Elephant Island, many of the men almost collapsed. Conditions were desperate, the island being glacier-capped, while the narrow beach was storm-swept and uninhabitable, so that they were obliged to excavate a cave in the glacier-cliff for shelter. Shackleton rose to the occasion. Leaving Wild in charge of 22 men, with food for five weeks, he dared the perils of an autumnal voyage of 750 miles to South Georgia for relief. With five volunteers Shackleton made the voyage in an open 22-foot boat, partially decked with box-lids, etc., in 16 days. On May 10th he landed on the uninhabited west coast of South Georgia, and crossing the unknown ice-covered mountains reached, 10 days later, the Norwegian whaling station. Three successive attempts to relieve the marooned men failed—through a Norwegian whaler, an Uruguayan trawler, and an English ship. Undismayed, Shackleton continued his efforts, and finally rescued the men, all well, from Elephant Island by the Chilean ship *Yelcho*, on Aug. 30, 1916.

Penguin, shell-fish, and seal had supplemented their food supplies and saved them from starvation.

Meanwhile, Shackleton's supporting ship, the *Aurora*, was sent in the Antarctic summer of 1914-15, under Capt. E. Mackintosh. She reached Ross Sea safely and her crew began their work of establishing food-depots on the Ross (Barrier) oceanic-glacier for Shackleton's coming. Finding no safe harbor the ship was moored and anchored to the ground-ice at Cape Evans where the shore-party worked. Moving floes and gales forced her off-shore several times. On

May 6, 1915, a terrific blizzard broke the moorings and drove the *Aurora* into the ice-fields where she was inextricably beset. Drifting north, after many weeks she escaped from the ice, and short of food and coal made her way to Australia. Captain Mackintosh and five men were left ashore in their temporary camp. There was no danger of starvation, as at or near Cape Evans were food supplies sufficient for them up to January, 1917, with sea-game plentiful. In December, 1916, Shackleton started from New Zealand with the relief-ship *Aurora*, commanded by Capt. John King Davis, an ice-master of exceptional skill and experience, to rescue Mackintosh and his party. Davis had been commander of the *Aurora* in five Antarctic voyages of Sir Douglas Mawson's Australasian Expedition (1911-14) and had made important discoveries.

ARCTIC. The Arctic expedition sent into Polar Canada under V. Stefánsson in 1913, by the Dominion of Canada, has finished its work in part. Stefánsson's researches contemplated separate parties, one for geographical exploration, led by himself, and the other, scientific, under Dr. Rudolph M. Anderson, who, since 1913, had been zoölogist of the Geological Survey of Canada. Anderson has finished his field work but Stefánsson is yet in the North. It will be recalled that the loss of the *Karluuk* in 1913 deranged all plans. After wintering (1913-14) at Collinson Point, near Camden Bay, Anderson proceeded in the schooner *Alaska* eastward, and established his headquarters on the south side of Dolphin Strait, where a house was built. For two years (1914-16) his party was occupied in thoroughly exploring adjacent regions. Chipman and O'Neill surveyed the Arctic coasts from Cape Barrow eastward to Stapyilton Bay. Cox extended this work to Rae River, which was explored about 75 miles from the mouth, and from the farthest point a traverse was carried across country for geological purposes. A geological reconnaissance was made of the whole Arctic coast from Bathurst Inlet to Barrow. The lower reaches of the Kogluktualuk River were explored, as were the 150 or more islands of the Chapman, Lewis, and Marcet groups. Meteorological observations were regularly made, and tidal readings when practicable. More than 1000 specimens of birds and mammals were brought back, as well as 30 tons of geological and other specimens. Jenness, the ethnologist, exhaustively studied the primitive Eskimos of Victoria Island, as to their domestic life, game, methods, language, customs, and amusements. The geological investigations promise to be of economic value. Coal beds several feet thick were found. The most important discoveries were large areas, near navigable waters, of country in which there were extensive deposits of low-grade copper ore. The deposits, which are easily workable, resemble the Lake Superior copper rock. Stefánsson has continued his geographical work with the pertinacity and resourcefulness characteristic of the man. As previously stated (YEAR BOOK, 1915), by a remarkable sledge journey northward over the ice of the Arctic Ocean he discovered new land in 78° N., 117° W., trending for 100 miles from southeast to northwest. Wintering on Banks Land, Stefánsson continued his original efforts to determine whether or not a large area of land exists between Alaska and the Pole, as forecast by Greely and Harris. The specific plans for 1916 looked to the exploration

of the unknown areas lying west, northwest, and northeast of the Parry Islands. Stefánsson assigned to himself a sledge journey across the sea-ice for 60 to 75 days from Cape Albert, expecting to reach 83° N., 145° W. Another party of six men and four sledges would attempt to reach 78° N., 117° W. It was hoped that one of Stefánsson's ships might reach Melville Island during the navigable season of 1916, so that it might form a winter base for 1916-17. The party expected to return south in the autumn of 1917.

Danish explorers continue their researches in continental Greenland. Its most notable representative at present is Knud Rasmussen, distinguished for service with Mylius-Erichsen (1902-04) and by his trans-Greenland journey of 1600 miles. His base of operations is Thule, a scientific station established by him in 1915, a short distance north of Cape York, which is permanently in charge of his subordinate, Freuchen.

Delayed in his northern voyage to Thule by unfavorable ice conditions in Baffin Bay, Rasmussen necessarily postponed to 1917 his project of crossing again the inland ice of Greenland in order to explore the unknown peninsula between Independence Fiord and Nordenskiöld Inlet. Instead he passed the late summer of 1916 in making a thorough exploration of the coast of Melville Bay between the districts of Upernivik and Cape York. He planned to determine its conditions as to archæology, botany, ethnography, cartography, and zoölogy.

Despite the energy and persistency of its members and of its supporters, the expedition headed by Donald B. MacMillan, has experienced successive disappointments and misfortunes. In 1914 it was unable to reach Bache Peninsula, Ellesmere Land, and had to establish its base at Etah, Greenland. The the mirage-luring Crocker Land, of Peary, 1906, disappeared when, by an arduous and dangerous journey, MacMillan and Green sledged across its alleged site. In 1915 Dr. E. O. Hovey's relief ship, the *Cluett*, broke down and, unable to reach Etah, was ice-bound in Parker Snow Bay. Green, Allen, and Tanquary returned by a sledge journey across Melville Bay to Upernivik. MacMillan and Ekblaw planned new scientific work while awaiting relief. In 1916 the Danish steamer *Danmark*, sent to the relief of Hovey and MacMillan, was evidently ice-bound, as on August 20th she was seen in Melville Bay, 76° N., 60° W., working northward through heavy ice. See also ALASKA.

**POLIOMYELITIS.** During 1916 a severe epidemic of poliomyelitis, commonly known as Infantile Spinal Paralysis, raged in New York City and State and in several neighboring States. Beginning in the early summer, there were, up to the middle of October, when the epidemic began to disappear, 9029 cases of poliomyelitis in New York City alone, under quarantine. Two hundred and fifty of these cases, however, were found not to be true cases of the disease. The total number of deaths was 2362, a mortality percentage of 26.44. Of the cases treated in hospitals 66 per cent showed evidence of paralysis; in 15 per cent paralysis had entirely disappeared; and in another 15 per cent there had not been any paralysis during the attack. In the State outside of New York City there were, up to September 14th, 2785 cases with 318 deaths. Connecticut had 677 cases (deaths not

reported); Massachusetts, 678 cases and 95 deaths; New Jersey 3495 cases, 775 deaths; and Pennsylvania 1278 cases, 313 deaths. In Wisconsin the State Board of Health reported 316 cases of poliomyelitis up to September 30th. The province of Ontario, Canada, was also visited by the epidemic and reported 49 cases with 5 deaths in September, 44 cases with 5 deaths in August, and 20 cases with 3 deaths in July. The New York State Health Department recorded 224 cases in 1914 with 68 deaths, while in 1915 there were 261 cases and 47 deaths.

Several laboratory workers have announced the discovery of what appeared to be the causative organism of this disease, but it cannot be authoritatively stated that the true germ has been found, nor do authorities agree as to the method of spread, mode of infection, and contagiousness of the virus. It has been shown, with a fair degree of accuracy, that the virus is contained in the lymphoid tissue in the pharynx, and emulsions of this tissue injected into monkeys will produce paralysis and other symptoms of the disease in these animals. Although ignorant of the method by which the disease is spread, the health authorities enforced strict quarantine as the best precaution available. This epidemic, as did previous epidemics, died out with the advent of cooler weather. Several types of the disease were recognized, the diagnosis in those cases showing no paralysis being largely made by an examination of the spinal fluid. Treatment was symptomatic and expectant, although some cases were treated by injection of serum drawn either from individuals who had recovered from the disease or from normal individuals. In New York City there were 420 cases treated with immune blood and 30 with normal blood serum. Many patients seemed to be favorably influenced, or their symptoms mitigated, by the serum injections, but no definite statement as to the value of treatment has been practicable.

A. Netter, of Paris, commends the treatment by serum and records 34 cases treated, of whom 8 were completely cured, 3 nearly cured, 9 materially improved, and 3 less markedly improved; while 8 cases died. He advocates injecting the serum into the spinal canal.

Some evidence has been adduced that insects and rats may carry the infection. In Massachusetts observations seem to show that the disease is endemic along the course of the rivers, most of which are polluted by sewers and infested with rats. Richardson believes that the rôle of cats, dogs, and other animals as carriers of infected fleas, merits consideration, the known facts with regard to the dissemination of poliomyelitis squaring with this hypothesis better than with any other theory.

**POLISH RELIEF.** See RELIEF FOR WAR VICTIMS, section so entitled.

**POLITICAL AND SOCIAL SCIENCE,** AMERICAN ACADEMY OF. In December, 1916, the membership of the academy was 6603. All the officers for 1915 were reelected in 1916, L. S. Rowe being president. It was announced that the 21st annual meeting would be held April 20-21, 1917. The following subjects were treated in the bimonthly *Annals* of the academy: "National Industries and Federal Government," (January); "Public Administration and Partisan Politics," (March); "Personnel and Employment Problems in Industrial Management"

(May); "Preparedness and America's International Programme" (July); "New Possibilities in Education" (September); "America's Changing Investment Market" (November). Of these issues C. H. Crennan, Meyer Bloomfield, Joseph H. Willits, Ambrose L. Subrie, and E. M. Patterson were editors. As a supplement, the 25th anniversary index of the *Annals* was published in March. As a supplement for May appeared "Steadying Employment" by Joseph H. Willits.

**POLITICAL ECONOMY.** The YEAR BOOK contains numerous articles treating matters of economic import. Under FINANCIAL REVIEW is given a general survey of business and financial conditions in the United States, Great Britain, France, Germany, Russia, Japan, and Canada. Under LABOR will be found references to subjects treating various aspects of industry; and likewise BANKS AND BANKING includes information regarding banking developments at home and abroad and gives references to other related articles. See also INSURANCE; OLD-AGE PENSIONS; PRICES; SOCIAL ECONOMICS; SOCIOLOGY; TARIFF; TAXATION; and TRUSTS.

THE AMERICAN ECONOMIC ASSOCIATION held its 29th annual meeting at Columbus, Ohio, December 27-30. Its opening sessions consisted of the following presidential addresses: Thomas N. Carver of this association, "The National Point of View in Economics"; George E. Vincent of the American Sociological Society, "Countryside and Nation"; Charles P. Neill of the American Statistical Association, "Opportunities for Practical Work by the Statistical Association"; Irving Fisher of the American Association for Labor Legislation, "The Need for Health Insurance." Several sessions were devoted to the consideration of land and agricultural problems, and included among others the following papers: "Landed Property as an Economic Concept and as a field of Research," by Richard T. Ely; "Two Dimensions of Economic Productivity, with Agricultural Illustrations," by Henry C. Taylor; "The Results of Some Rural Surveys in Iowa," by George H. von Tungeln; "Land Problems and Rural Welfare," by Paul L. Vogt; and "The Rural Credits Law," by C. W. Thompson. In conjunction with the American Statistical Association the significance of statistics regarding the concentration of wealth in the United States was discussed by Profs. Allyn A. Young, W. I. King, and Davis R. Dewey, and Dr. George P. Watkins. The European war was the occasion of a paper by Prof. O. M. W. Sprague of Harvard on "Loans and Taxes in War Finance"; and another by George E. Roberts of the National City Bank on "The Situation of the United States at the Close of the European War with Special Reference to the Gold Supply." Aspects of labor problems were considered in a paper on "Some Phases of the Immediate Wage Question" by J. E. Le Rossignol; and "Legislation vs. Collective Bargaining as a Method of Securing the Regulation of the Hours of Labor" by Prof. George G. Groat. At the special dinner brief addresses as follows were made: "The Place Which Accounting Should Occupy in Any Scheme of National Preparedness," by Edward M. Hurley; "The Price of Securities," by Roger W. Babson; "Immigration," by W. Jett Lauck; "Population," by James A. Field; "The Redistribution of the Labor Now Employed in Pro-

ducing War Supplies," by Mrs. Haviland H. Lund; "Agriculture," by E. Dana Durand; and "Debts and Taxes After the War," by T. S. Adams.

**Bibliography.** Below is given a classified list of some of the more important books published during the year. Additional bibliographies of interest here will be found under AGRICULTURAL CREDIT; ARBITRATION AND CONCILIATION, INDUSTRIAL; CHARITIES; CHILD LABOR; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; SOCIAL ECONOMICS; SOCIOLOGY; WOMEN IN INDUSTRY; and WORKMEN'S COMPENSATION.

*General Works:* Henry Clay, *Economics*; E. L. Bogart, *Business Economics*; J. K. Ingram, *History of Political Economy*; G. Juglar and C. W. Thom, *A Brief History of Panics and Their Periodical Occurrence in the United States*; E. S. Mead, *Economics*; Logan G. McPherson, *How the World Makes Its Living*; Edwin G. Nourse (Ed.), *Agricultural Economics*; Dennis H. Robertson, *A Study of Industrial Fluctuation*; J. A. Ryan, *Distributive Justice*; T. N. Carver, *Selected Readings in Rural Economics*.

*Economic History:* E. L. Bogart, *Readings in the Economic History of the United States*; F. C. Howe, *Why War?*; E. Huntington, *Civilization and Climate*; M. Millioud, *The Ruling Caste and Frenzied Trade in Germany*; J. H. Rose, *Nationality in Modern History*; A. H. Sanford, *The Story of Agriculture in the United States*; J. H. Jones, *The Economics of War and Conquest*; V. S. Clark, *History of Manufactures in the United States, 1607-1860*; H. Hauser, *Les Methodes Allemandes d'expansion Economique*; A. M. Wergelund, *History of the Working Class in France*; J. B. Williams, *A Guide to Some Aspects of English Social History, 1750-1850*.

*Money and Banking:* H. Parker Willis, *American Banking*; C. A. Phillips, *Readings in Money and Banking*; H. Withers, *International Finance*; William L. Raymond, *American and Foreign Investment Bonds*; Louis Heft,  *HOLDERS of Railroad Bonds and Notes: Their Rights and Remedies*; Harold G. Moulton, *Principles of Money and Banking*.

*Transportation and Commerce:* Harry G. Brown, *Transportation Rates and Their Regulation*; F. W. Doolittle, *Studies in the Cost of Urban Transportation Service*; M. Ferguson, *State Regulation of Railroads in the South*; Emory R. Johnson, T. W. Van Metre, G. G. Huebner, and D. S. Hanchett, *History of Domestic and Foreign Commerce of the United States*; Robert J. McFall, *Railway Monopoly and Rate Regulation*; L. D. H. Weld, *The Marketing of Farm Products*; Mark Wymond, *Railroad Valuation and Rates*; *Course in Foreign Trade*, a series of 6 vols., issued under the direction of E. E. Pratt, as follows: I. *Economics of World Trade*, by O. P. Austin; II. *The World's Markets. From the Point of View of American Exporters*, by Edward N. Vose; III. *Export Policies*, by E. E. Pratt, E. C. Porter, and P. B. Kennedy; IV. *Export Houses*, by John F. Fowler, C. A. Richards, and Henry A. Talbot; V. *Direct Exporting. Presenting the Problems of the Exporting Manufacturer*, by Walter F. Wyman; VI. *The Export Salesman*, by Paul R. Mahony; T. Farrow and W. W. Crotch, *The Coming Trade War*; E. R. Johnson and G. G.

Huebner, *Shipping in Its Relation to Our Foreign Trade*; J. Russell Smith, *Commerce and Industry*.

**Business Origin and Methods:** John R. Wildman, *Principles of Auditing*; H. F. Adams, *Advertising; Its Mental Laws*; J. M. Harlan and L. W. McCandless, *The Federal Trade Commission*; A. W. Shaw, *An Approach to Business Problems*; R. S. Butler, *Marketing Methods and Salesmanship*; N. A. Brisco, *Fundamentals of Salesmanship*; L. Galloway, *Organization and Management*; F. B. and L. M. Gilbreth, *Fatigue Study*; C. E. Knoeppel, *Industrial Preparedness*; J. Lahy, *Le systeme Taylor et la physiologie du travail professionnel*; J. E. Davies, *Trust Laws and Unfair Competition*; Hastings Lyon, *Corporation Finance*; W. Z. Ripley (Ed.), *Trusts, Pools, and Corporations*; H. L. Gantt, *Industrial Leadership*.

**Labor:** J. R. Commons and J. B. Andrews, *Principles of Labor Legislation*; Charles B. Barnes, *The Longshoremen*; Brassey, *Work and Wages*; G. G. Groat, *An Introduction to the Study of Organized Labor in America*; George Sorel, *Reflections on Violence*, tr. by T. E. Hulme; Annie M. MacLean, *Women Workers and Society*; George M. Janes, *The Control of Strikes in American Trade Unions*; M. Bloomfield and J. H. Willits (Eds.), *Mediation, Investigation, and Arbitration of Industrial Disputes*; W. J. Lauck and E. Sydenstricker, *Conditions of Labor in American Industries*; H. A. Mess, *Casual Labor at the Docks*; The Rand School of Social Science, *The American Labor Year Book, 1916*; Leo Wolman, *The Boycott in American Trade Unions*; W. S. Sanders, *Trade Unionism in Germany*.

**Taxation and Public Finance:** J. C. Stamp, *British Incomes and Property*; Fritz Mender, *Das moderne Zollschutzsystem*; C. Chu, *The Tariff Problem in China*; A. C. Pigou, *The Economy and Finance of the War*; W. Sanders, *The Practice and Law of Excess Profits Duty*; A. N. Young, *The Single Tax Movement in the United States*; E. F. Davies, *The Finances of Great Britain and Germany*; G. R. Salerno, *Scienza della Finanze* (Florence); L. Einandi, *Corso di Scienza della Finanze* (Turin); W. B. Munro, *Principles and Methods of Municipal Administration*.

**POLITICAL PARTIES IN THE UNITED STATES.** See UNITED STATES, *Presidential Campaign*; section *Politics* of the various State articles.

**POLO.** No international polo matches were played during 1916. The United States National Championships were contested at Narragansett Pier, R. I., the junior title being won by the Meadow Brook, 3rd team, comprising F. S. Von Stade, Raymond Belmont, Thomas Hitchcock, Jr., and Morgan Belmont. The contender for the junior honors was the Point Judith four consisting of Philip Stevenson, Rodman Wanamaker, P. S. P. Randolph, Jr., and A. C. Schwartz. The score was 11½ to 2¾.

Meadow Brook defeated Great Neck for the senior championship, the score being 9¾ to 7¾. The Meadow Brook players were: F. S. Von Stade, H. P. Whitney, D. Milburn, and C. C. Rumsey. The Great Neck team was made up of J. Watson Webb, Thomas Hitchcock, Jr., L. E. Stoddard, and Malcolm Stevenson.

In the final match for the inter-circuit championship played at Philadelphia, the Eastern

four—Thomas Hitchcock, Jr., J. Watson Webb, Malcolm Stevenson, and D. Milburn—defeated the Southeastern four—W. S. Stokes, E. L. Stokes, Thomas Stokes, and R. E. Strawbridge—by a score of 15 to 12½.

**POLYNEURITIS.** See VITAMINS.

**POMERENE, ATLEE.** Relected Democratic United States Senator from Ohio, Nov. 7, 1916.

**POMERENE BILL.** See RAILWAYS.

**POOL.** See BILLIARDS AND POOL.

**PORTER, SYDNEY.** See LITERATURE, ENGLISH AND AMERICAN, *Essays, etc.*, American.

**PORT IMPROVEMENT.** See DOCKS AND HARBORS.

**PORTMANTEAU THEATRE.** See DRAMA.

**PORTO RICO. AREA AND POPULATION.** The area of the island is 3435 square miles. The estimated population in 1916 was 1,216,083. The population in 1910 was 1,118,012.

**AGRICULTURE.** The activities of the Board of Commissioners of Agriculture for the betterment of agriculture in Porto Rico were continued during 1915-16. The work of the insular station was extended, and a number of bulletins were issued on important subjects. In addition to the acreage under cane, planting of various fruits and vegetables was made. The regulations regarding the inspection and fumigation of plants to prevent the entrance into Porto Rico of plant diseases and noxious insects were rigorously enforced. Efforts begun in 1915 to secure a market for Porto Rican coffee in the United States were continued, and some progress was made. The chief products of the island are sugar, coffee, tobacco, and fruits. Agriculture is the great basic industry of Porto Rico, and constitutes the source of livelihood of more than four-fifths of its people. The diversity and general upbuilding of agriculture is the fundamental economic task of both the people and the government of the island.

**COMMERCE.** The total value of exports from Porto Rico for the year ending June 30, 1916, was \$66,731,573, the highest total ever recorded, exceeding the figures of 1915 by \$17,374,666. The increase in sugar alone was \$18,530,691, increasing from \$27,278,754 in 1915 to \$45,809,545 in 1916, due to a large increase both in quantity produced and the price. The quantity of sugar exported during the year was 424,956 short tons. The increase in the total exports was more than \$1,000,000 less than the increase in sugar alone, showing that there was a considerable decrease of the total exports of articles other than sugar. Practically all the decrease was in four articles, coffee, pineapples, cigars, and tobacco, which together showed a combined decrease of \$3,236,826. On the other hand there were seven articles which showed an increase in export figures, amounting when combined, to almost \$2,000,000. The most notable of these are molasses, oranges, and straw hats, which show increases varying from 70 to more than 100 per cent over the figures of the preceding year. There was a great decline in the quantity of coffee produced, which fell from 51,125,630 pounds in 1915 to 32,144,283 pounds in 1916, a decrease of about 37 per cent.

The value of imports from the United States was \$38,951,156 in 1915, compared with \$33,884,296 in 1914. Imports from the United States gained in value \$4,962,684, and amounted to \$35,892,515. For the first time in the history of the island the total external trade ex-

ceeded \$100,000,000, reaching the large sum of \$105,682,729.

**EDUCATION.** There were in the island in 1916, 419,599 persons of legal school age. Of these 151,562 or 35.8 per cent were enrolled in the public schools. Of the entire school population 79 per cent live in rural communities and of these only 26 per cent were enrolled in the public schools. In the urban centres 72.5 per cent of the children of legal school age were enrolled. Teachers numbered 2488 of whom 2296 were Porto Ricans. The public schools were conducted in 1506 different school buildings. During the year 59 new sites for school buildings were acquired, and 83 new school buildings were completed or in process of construction. The total expenditures for educational purposes were \$1,840,016. Great efforts were made during the year by the commissioner of education to increase the general efficiency of the work in his department, especially throughout the rural districts. Some progress was made in the development of prevocational and industrial education, with promising results, considering the limited amount of sums available for the purpose. The legislature of 1916 provided for the establishment of 275 additional rural schools.

**HEALTH AND SANITATION.** The work of sanitary survey of watersheds was continued during the year. New water works systems were completed in a number of municipalities, and the construction or reconstruction of others is in progress. Attention and study also were given to the matter of filtration of water, and its sterilization. There was an epidemic of smallpox in May, June, and July of 1916. Notwithstanding this the mortality was not sufficient to affect the general mortality rate. The insular board of health prepared a number of rules and regulations relative to sanitation in dwellings and places of business. Studies of tropical medicine and hygiene were continued during the year, and much valuable work was accomplished.

**FINANCE.** For the fiscal year 1916-17, the general property tax on the island increased by one-fourth of 1 per cent, all the increase to go into the insular treasury. This will add about \$450,000 for the revenue for that year. The receipts for the fiscal year amounted to \$9,142,352. There was a balance at the beginning of the year of \$2,672,495. The total expenditures were \$5,776,924. The balance at the end of the year was \$6,037,923. Two issues of bonds, one of \$2,000,000, and the other of \$1,000,000, were authorized during the year. The first was for public improvements, and the second for the establishment of an agricultural bank.

**CHARITIES AND CORRECTIONS.** These include the Blind Asylum, the Girls' Charity School and the Boys' Charity School, and the Insane Asylum. Provision has been made for the erection of a new building for the insane asylum but this has been delayed. In the penal institutions there were committed during the year 5776 prisoners. The juvenile court act which took effect on July 1, 1915, is proving of great benefit to delinquent minors. In the reform school for boys agricultural training is carried on.

**LEGISLATION.** The second session of the eighth legislature convened on February 14th, and adjourned on April 13, 1916. During the session there were passed 80 laws and 23 joint resolutions, all of which were approved by the

government. Among the measures passed were those relating to revenue and taxation. Of special importance was the law for the relief of workmen injured in their trade or occupation. In addition to these there was passed an act for the standardization of government supplies and a centralization of purchases by the government. There were also passed several amendments to the school law, to the penal code, and to the license code. A bill providing for citizenship of the Porto Ricans was introduced into the 64th Congress. On May 23rd the House of Representatives struck from the bill an amendment designed to create woman suffrage in the island. The vote was 80 to 59. The bill was then passed virtually as it was introduced. A measure gives to the Porto Rican government all its internal revenue regardless whether the goods on which the revenue was paid are used in Porto Rico or the United States. Hitherto a revenue on goods used in the United States has gone to the Federal treasury. Additional qualifications were provided for applicants for citizenship under the measure. The employment of children under 14 years of age in injurious or dangerous occupations is prohibited. The measure went to the Senate, where no action was taken at the end of the year.

The Governor in 1916 was Arthur N. Yager.

**PORTUGAL.** A European republic (since 1910), occupying the western coast of the Iberian Peninsula. The capital is Lisbon.

**AREA AND POPULATION.** The area by districts and the results of the census of December, 1911, compared with that of 1900, with density per square kilometer in 1911, are shown in the following table:

	Sq km.	1900	1911	D.
Aveiro .....	2,758	303,169	386,243	116
Beja .....	10,255	183,612	192,499	19

Azores .....	2,388	256,691	242,565	101
Madeira .....	815	158,574	169,783	208
Republic ...	91,943	5,423,132	5,960,056	65

Of the total population in 1911, 2,823,691 were males and 3,131,365 females. Foreigners in the country numbered 41,197, of whom 20,517 were Spaniards and 12,143 Brazilians. The principal towns, with their population in 1911, were: Lisbon, 435,359; Oporto, 194,009; Setúbal, 30,346; Funchal (Madeira), 24,687; Braga, 24,647; Coimbra, 20,581; Evora, 17,911; Ponta Delgada (Azores), 16,179; Covilhão, 15,745; Faro, 12,680; Tavira, 11,665; Portalegre, 11,603; Aveiro, 11,523; Elvas, 10,645; Viana do Castelo, 10,486; Beja, 10,113; Angra do Heroísmo (Azores), 10,067; Silves, 9919; Santarém, 9897; Lagos, 8167; Castel Branco, 7798. Births

in 1913 numbered 199,765, deaths 124,748, marriages 39,950, emigrants 77,633 (chiefly to Brazil and the United States).

**PRODUCTION.** Agriculture engages three-fifths of the population. Crops and pasture occupy 26.2 per cent of the total area; vineyards, 3.5; orchards, 3.9; forest, 17.3; 43.1 per cent is barren or uncultivable. The production of wheat in 1914-15 was 6,367,968 bushels. Complete production figures are unavailable. In the highlands cereals, flax, hemp, and vines are grown; the products of the lowlands are rice, olives, almonds, figs, and citrous fruits. Live stock is raised. The mineral output is important. Output of sulphur in 1912, 339,096 metric tons; copper, 905; copper precipitate, 5582; cupreous pyrites, 8843; iron, 29,413; arsenic, 941; anthracite, 15,366; silver ore, 4646; uranium, 850; wolfram, 982. Salt, marble, gypsum, and lime are worked. The manufactured products are gloves, silks, woollens, linens, cottons, metal and metal wares, tobacco, cigars, etc. The value of the fisheries products in 1914 was £1,480,513 (sardines, £707,909).

**COMMERCE AND COMMUNICATIONS.** The special trade is shown in contos (1 conto = 1000 milreis) for three years: A = raw materials, B = foodstuffs, C = yarns and textiles, D = machinery, implements, etc., E = miscellaneous manufactures, F = live animals, G = tare, C and B = coin and bullion, and includes all precious metals.

	Imports			Exports

<b>Total.</b> . . . . .	<b>68,127</b>	<b>75,712</b>	<b>89,941</b>	<b>34,065</b>	<b>34,966</b>	<b>36,684</b>

The principal articles of export in 1913, with values in thousands of milreis, were wine, 12,163; cork, 4209; animals, 3418; fish, 3110; tropical fruits, 1111; timber, 1133; copper, 1185; olive oil, 519. The principal countries of origin and destination (values in thousands of milreis), were the United Kingdom with imports, 23,490, and exports, 7601; Germany, 15,840 and 3407; United States, 9892 and 1225; Belgium, 4049 and 1110; France, 7594 and 1334; Spain, 3845 and 5479; Portuguese colonies, 2847 and 4944; Brazil, 1651 and 6193; Netherlands, 1789 and 710; Italy, 1816 and 579; Norway, 2180 and 207. Vessels entered in the 1913 trade, 10,638 of 24,568,120 tons. Merchant marine (1911), 66 steamers, of 70,193 tons, and 259 sail, of 43,844.

Railways in operation Dec. 31, 1913, 1840 miles (711 state-owned). Telegraph lines (1912), 5945 miles; wires, 13,415. Post offices (1913), 4266.

**FINANCE.** The monetary unit is the escude, which has the same value as the milreis (\$1.08046), but is divided into 100 centavos, whereas the milreis represented 1000 reis. The centavo equals 10 reis. The table below gives revenue and expenditure for comparative years (budget estimates):

	1913-14	1914-15	1915-16
Revenue .....	75,894,000	83,390,965	78,043,630
Expenditure .....	74,915,000	79,669,140	88,645,951

A British authority states the debt June 30, 1915, as follows: £38,996,374 external, £134,183,128 internal.

**NAVY.** See NAVAL PROGRESS.

**GOVERNMENT.** The republic was proclaimed Oct. 5, 1910, and sanctioned by the national assembly Aug. 21, 1911. The constitution of Aug. 21, 1911, provides for a president (1915-19, Bernardino Machado), to be elected every four years by the congress. He is not eligible for reelection. He appoints his ministers, who are responsible to the parliament. This body is composed of a senate of 71 members elected for six years, and a chamber of deputies directly elected for three years.

**HISTORY**

**PORTUGAL'S ENTRY INTO THE WAR.** On the outbreak of the war Portugal made it known that she would be faithful to her treaty obligations to Great Britain and would aid the Allies whenever she was called upon to do so. The treaty with Great Britain bound her to supply the latter with 10,000 troops when the latter required them. Great Britain made no demand for them but early in 1916 urged the Portuguese government to requisition certain German ships interned in Portuguese waters. On February 24th the Portuguese government took possession of 36 Austrian and German merchantmen in the Tagus and the next day of 8 German steamships at St. Vincent, Cape Verde Islands, declaring, however, that it was not an act of war but a measure of public interest, and offering the payment of compensation. Germany immediately demanded their restoration and, upon Portugal's refusal, declared war (March 9th). The reasons given by Germany for this action were the repeated breaches of neutrality by Portugal, for example, free passage of British troops through Mozambique, collisions between Portuguese and German troops on the southwest African and Angola frontiers, unfair permission to British vessels to use Portuguese ports and to use Madeira as a naval base, insults to Germany by Portuguese deputies, etc. On March 10th the cabinet resigned to give place to a national defense government which was announced on March 15th. Antonio Almeida was Premier. Parliament had voted the government necessary powers for carrying on the war. In an interview published on April 11th, President Machado was recorded as saying that the government was doing all in its power to aid in the prosecution of the war, and that it had requisitioned the ships that were interned in its ports to be used for warlike or commercial purpose in accordance with the necessity of the Allies. He said that the war had led the government to determine to put an end forever to the policy of isolation which had hitherto been followed. The aloofness of Portugal in the past had allowed Germany to gain advantages at the expense of England. It was announced on April 18th that the government had decreed the expulsion of all Germans over military age, the internment of the others, and the sequestration of German

property. Great activity was reported during the summer in the Portuguese navy, a number of vessels being repaired and efforts being made to find crews for others. On April 11th the ministry resigned on account of differences over the question of amnesty for political offenders.

**INTERNAL CONDITIONS.** In January the total expenditures caused by the European war were placed at \$105,000,000. The budget on January 13th showed a deficit of \$3,000,000. In February there were several casualties in Lisbon occasioned by strikes and food riots. On December 13th there were disorders at several points throughout the country. The soldiers in the garrisons at Castelobranco and Abrantès mutinied and were promptly arrested. A still more serious movement appeared at Thomar, but after the intervention of the loyal troops, order was soon restored. Vigorous measures were taken at Lisbon to maintain order, and it was reported toward the end of the month that there was no further difficulty. Precise information on the subject could not be had, but according to the governmental authorities the movement was of no importance. The head of it was an ex-officer of the navy named Machado dos Santos, who had taken part in the overthrow of the monarchy, but who had continued to disturb the new government. He started out from Thomar with 300 soldiers in the direction of Abrantès, but was arrested. Many of his companions had already left him and the rest surrendered.

The Prime Minister made a report to Parliament on these events and said that the trouble was over. The causes of the uprising were in general the discontent among the Conservatives and Monarchists occasioned by Portugal's participation in the war. They had opposed this from the first, and arguments failing, had resorted to seditious means in which, according to their opponents, German money and aid had played a part. It was said that the Monarchists in Portugal, with few exceptions, sympathized with these movements. They were accused by the friends of the government of carrying on a campaign of false reports and trying to demoralize the *morale* of the troops. It was alleged that the well known Couceiro, who for several years past as the chief of the Royalist absentees had tried to invade the north of Portugal, was involved in this movement, despite the fact that the ex-King Manuel had formally commanded his loyal supporters not to embarrass the government in its policy of making war on the side of the Allies. They addressed circulars to their fellow Catholics everywhere, and in one of them, published in the *Seculo*, appealed to them on the ground of the danger to Portugal's relations with Spain and the damage and loss of life that would result to the country. See **WAR OF THE NATIONS.**

**PORTUGUESE EAST AFRICA** (MOZAMBIQUE). A Portuguese colony in Africa, covering 293,860 square miles and having about 3,120,000 inhabitants. Capital, Lourenço Marques.

**PORTUGUESE GUINEA.** A Portuguese West African colony, covering 13,490 square miles and having about 820,000 inhabitants.

**POTATOES.** Although data with reference to the world's potato production in 1916 were very incomplete, they indicated nevertheless that the yield was smaller than in 1915. The crop in Great Britain was reported below the average as a result mainly of disease attacks, and in France, which ranks high as a potato producing country, the total production was also under normal, due mainly to the inability of properly caring for the crop, as the area, 3,225,000 acres, was larger by several thousand acres than in 1915. The average yield in France, where only about 3 per cent of the acreage produces potatoes for industrial purposes, is about 130 bushels per acre. Germany, the leading potato producing country of the world, produces an average of approximately 220 bushels per acre, but a large percentage of the annual area, over 8,000,000 acres, produces tubers used in the industries, about 80 per cent of the entire output of over 100,000,000 gallons of alcohol being derived from potatoes. For Russia, which leads all countries in acreage, no recent data on production were available. The yield of Rumania was reported as almost one-fourth greater than in 1915 and about one-third greater than the average for the five years 1909-1913. The crop of Bermuda was normal and of good quality. Two crops are harvested there each year, one in April and May and the other from November to January. In 1916 the first shipment from the late crop to the United States sailed on November 25th, consisted of 371 barrels, and brought \$1781. About 8000 barrels of Bliss Triumph seed potatoes were imported by Bermuda from Long Island as compared with about 6000 barrels in 1915. Canada reported a lower production than in the preceding year as a result of unfavorable seasonal conditions, and an acreage reduction from 479,000 to 449,000 acres. In the Province of Ontario the average yield per acre was estimated at only 53 bushels as against 76 in 1915.

The production of the United States, as estimated by the Department of Agriculture, was 285,437,000 bushels, produced on 3,550,000 acres at the rate of 80.4 bushels per acre. The corresponding figures were respectively 359,721,000 bushels, 3,734,000 acres, and 96.3 bushels for 1915, and 360,772,000 bushels, 3,686,000 acres, and 97.9 bushels for the five years 1910-1914. The farm value on Dec. 1, 1916, was 146.1 cents per bushel and the total crop value on this basis \$417,063,000, both figures being the highest ever recorded. The value per acre on the basis of the December 1st price was \$117.48. The average farm value on Dec. 1, 1915, was 61.7 per bushel and for the five preceding years as of the same date, 59.2 cents. The leading States and their yields in 1916 were as follows: Maine, 25,000,000; New York, 22,400,000; Pennsylvania, 19,040,000; Minnesota, 16,800,000; Virginia, 16,250,000; Michigan, 15,360,000; Wisconsin, 13,630,000; California, 10,575,000, and New Jersey, 10,370,000 bushels. The highest average yield, 204 bushels per acre, was secured in Maine. It is estimated that for the five-year period 1910-1914, the annual supply of potatoes in the United States was about 363,300,000 bushels or over 3.5 bushels per capita. About 70 per cent of the crop in the United States is harvested in September and October and about 32

per cent of the crop is moved from the county in which it is produced. See **HORTICULTURE**.

**PRATT, SILAS GAMALIEL.** An American composer, died in Pittsburgh, Pa., Oct. 30, 1916. He was born in Addison, Vt., in 1846, and was educated in music under American teachers until he was 22 years old, when he went to Berlin to study the piano under Bendel and Kullak and composition under Kiel. Afterward he studied score reading with Dorn. He organized the Apollo Club of Chicago in 1872. Removing to New York in 1890, he became professor of the piano in the New York Metropolitan Conservatory, and in 1906 went to Pittsburgh, where he established the Pratt Institute of Music and Art. He arranged and conducted many musical festivals and often gave concerts of his own composition both in the United States and Europe. As a composer he favored the larger forms. His works include three operas, *Zenobia* (1882), *Lucille* (1887), and *The Triumph of Columbus* (1893); three symphonies; two symphonic poems, *Sandalphon* and *A Tragedy of the Deep* (in commemoration of the *Titanic* sinking); *A Centennial Overture*; a festival overture, *The Voyage of Columbus*; a suite for orchestra, *The Tempest*; songs and piano pieces.

**PRATT INSTITUTE.** A non-sectarian co-educational institution in Brooklyn, N. Y. There were 3341 students enrolled in all departments in the fall of 1916. The faculty numbered 203. In the library were 112,200 volumes. President, Charles Millard Pratt.

**PRESBYTERIAN CHURCH.** The total number of Presbyterian church members in the United States in 1916 was 2,708,968; the number of adherents was 5,000,000. There are four large and several smaller denominations under the Presbyterian system. The largest is the Presbyterian Church of the United States of America, known as the Northern Presbyterians, with 1,560,009 communicants (an increase of 64,852 over 1915), 9953 churches, and 9739 ministers. The Presbyterian Church of the United States, known as the Southern Presbyterians, in 1916 had 348,223 communicants, 3437 churches, and 1861 ministers. Other Presbyterian churches, which are treated under their own titles, are the Cumberland Presbyterian Church, the United Presbyterian Church, and Reformed Presbyterians (including several branches in the North and South). A very small body is the Associated Presbyterian denomination, numbering in 1916 500 communicants, 14 churches, and 9 ministers.

The Northern Presbyterian Church, officially known as the Presbyterian Church of the United

States of America, is divided into 40 synods, with 291 presbyteries. The Sunday school scholars in 1916 numbered 1,427,208, an increase of 40,094 over 1915. The total contributions for all purposes were \$28,122,426, an increase of \$337,390 over 1915. Of the total contributions in 1916 \$20,101,322 was for congregational purposes, \$2,000,614 for home missions, \$1,738,025 for foreign missions, and \$467,914 for colleges. The general assembly is the chief governing body of the church. The missionary work is carried on under the control of the board of foreign missions and the board of home missions. In 1916 there were 27 foreign missions, 162 stations, 1330 missionaries, 6097 native helpers, 914 fully organized churches, 148,688 communicants, 1857 schools, 74,763 pupils, 176,168 pupils in Sabbath schools, 172 hospitals and dispensaries, 991,416 patients treated annually. The number of pupils, schools, and hospital patients is given as fully as is compatible with different war conditions. The board of education controls the educational work of the denomination, and provides pastoral care and religious instruction for students in State universities and State colleges. The denomination has 12 theological seminaries, with 840 students in 1916, of whom 192 graduated, and 66 colleges and universities, with 26,268 students. Other important boards are the board of publication and Sunday school work, the board of church erection, and the board of ministerial relief and sustentation.

During the sessions of the general assembly of 1916, of which Rev. John Abner Marquis was moderator, some of the acts passed were these: Refusing to trustees of anti-saloon league election or approval by synods; reaffirming the doctrine of deliverance of 1910 as to the following points: inerrancy of the Scriptures, virgin birth of Jesus Christ, vicarious atonement of Jesus Christ, bodily resurrection of Jesus Christ and the actuality of His miracles; changing the name of the Presbyterian Brotherhood to Permanent Committee on Men's Work; urging public officials to enforce Sabbath law, especially against motion picture houses; approving bill for national prohibition; disapproving the use of tobacco by ministers and other office bearers. See also **RELIGIOUS DENOMINATIONS AND MOVEMENTS.**

**PRESIDENTIAL CAMPAIGN, UNITED STATES.** See **UNITED STATES, Presidential Campaign.**

**PRÉVOST, MARCEL.** See **FRENCH LITERATURE, Novels.**

**PRICES.** One of the most important economic changes of the year was the upward movement of prices in general and the very sharp rise in the prices of food products. These movements affected all parts of the world, and were everywhere followed by governmental and private efforts to combat them. Early in the year Germany carried one step farther her administrative measures for the regulation of food supplies, their distribution, and their prices. Towards the close of the year Great Britain also created a "food dictator." All other belligerent nations and neutral countries of Europe and South America attempted by changes in import and export regulations and by numerous measures of internal regulation to check the tendency toward higher prices of food products.

In the United States the question of high

food prices became a factor in the presidential campaign; the increased cost of living gave a stimulus to the formation of coöperative societies; and in the later months of the year there were extensive, though loosely organized, boycotts against eggs, poultry, and meat products. In New York a group of 300 women representing Socialist organizations marched to the City Hall to demand that the mayor use public authority in reducing food prices and perfecting food distribution. In December it was announced that a national conference of producers, farmers' organizations, and consumers' leagues had been called to meet in New York in April, 1917, to consider methods of eliminating middlemen's profits and bringing producer and consumer together. Public mass meetings were held in Faneuil Hall, Boston, and in numerous other cities. On the first day that Congress assembled, 11 bills and resolutions dealing with the high cost of living were introduced in the House. Various of these bills dealt with a proposed embargo on the exportation of farm products or manufactured food products. Others authorized a reduction of parcel post rates on food products; prohibited the shipment in interstate commerce of food products, except butter stored for more than 10 months, and required the branding of all cold storage articles with the date of their admission. A committee of the American Federation of Labor interviewed President Wilson, who promised to endeavor to secure speedy action from Congress. It was expected that the President would make this question the subject of a special address to Congress. Meanwhile Secretary of Commerce Redfield had begun the collection of data relating to the differences in prices paid to producers and those paid by consumers. Moreover, Attorney-General Gregory had ordered grand jury investigations in New York and Detroit with the prospect of similar investigations in other large cities. These investigations were under the direction of United States District Attorney George W. Anderson of Boston and were expected to relate particularly to combinations of dealers in food products. It was announced late in December that a result of these inquiries would be the indictment of large coal dealers on charges of extortion and retardation of shipment in order to create public alarm.

Throughout the year prices of eggs ranged materially higher than in preceding years. At New York City, for example, the wholesale prices of New York State fresh eggs on different dates were as follows: Aug. 15, 1914, 26 cents; Jan. 1, 1916, 36 cents; September 1st, 34 cents; October 1st, 38 cents; November 1st, 42 cents; December 1st, 45 cents; Jan. 1, 1917, 48 cents. Retail prices ranged materially higher, especially in the later months of the year when throughout the East they remained steadily in the region of 65 cents per dozen. This led to boycotting movements by housewives' leagues, but with slight effect on prices. Investigations disclosed the fact that the number of eggs in cold storage was markedly less than in previous years, due primarily to a great increase in exportation to Europe.

**AMERICAN INDEX.** While commodity prices had advanced before the close of 1915 so as to impress the average consumer that at least food prices were perceptibly increasing, nevertheless any advance from the beginning of the war to the close of 1915 was almost negligible in com-

parison with the unprecedented rapidity and amount of advance during 1916. The advance was most marked in food prices. Thus *The Economist* index number showing the changes in the average wholesale price of 25 food products so selected as to represent an average family budget, advanced from 148.939 on Dec. 11, 1915, to 208.038 on Dec. 9, 1916. This was an advance of 40 per cent in the general level of food prices for the year. *Bradstreet's* index number giving the aggregate prices per pound of 96 different articles, including all kinds of food products, 13 metals, 11 chemicals and drugs, 7 building materials, and numerous other articles, stood at \$9.0354 on Dec. 1, 1914. One year later it was \$10.6473. On the first day of each month in 1916 this index was as follows: January, \$10.9163; February, \$11.1415; March, \$11.3760; April, \$11.7598; May, \$11.7485; June, \$11.6887; July, \$11.5294; August, \$11.4414; September, \$11.7803; October, \$12.0399; November, \$12.7971; and December, \$13.6805. These figures should be compared with the following average indexes for certain preceding years: 1896, \$5.9124; 1900, \$7.8839; 1905, \$8.0987; 1906, 8.4176; 1907, \$8.9045; 1910, \$8.9881; and 1912, \$9.1867. During 1916 the only groups of articles showing a decline in prices were naval stores and chemicals and drugs. The advance in breadstuffs was 60 per cent; in fruits, 50 per cent; and striking advances were made in metals, oils, hides and leather, textiles, coal, and coke. This index on Nov. 1, 1916, was 116 per cent greater than the low level for the year 1896; it represented an advance in the general level of prices of 2 per cent since 1900, of 42 per cent since 1910, and of 23 per cent since Nov. 1, 1915.

**GREAT BRITAIN.** A departmental committee under the chairmanship of J. M. Robertson, M.P., was appointed by the Board of Trade to investigate the causes of price increases and to recommend steps for relieving the situation. A preliminary report of this committee reviewed the movement of prices, wages, and employment from 1914 to 1916 and drew the conclusion that on the whole "there is less total distress in the country than in an ordinary year of peace, the majority of the classes which chronically suffer from distress being in unusually regular employment" at advanced wages. On the other hand, it pointed out that certain classes of workers who usually are regularly employed, such as cotton operatives and salaried persons, were suffering much from higher price levels. After reviewing the supplies of meat, milk, and bacon, the committee recommended that there be increased construction of vessels, especially for refrigerated meat; that the congestion on docks and railways be relieved by increased labor forces; that the government further restrict the importation of less necessary commodities; that the government exercise increased control over slaughtering; that the prohibitions on the importation of live cattle from Canada be relaxed; that the government extend its services in the purchase of meat and the disposal of it to the civil population; that the consumption of meat by all not engaged in manual labor be restricted; that the government aid the establishment of refrigerating plants at South American ports; that numerous measures be taken to regulate the milk supply, including particular attention to the establishment of maternity centres, baby

clinics, and child nurseries; and that all civil authorities consider the possibility of increasing the wages of women and the lower paid employees.

The statistics of the *Labour Gazette* showed that during the year ending Sept. 30, 1916, retail food prices advanced 20 per cent, making a total advance from July, 1914, of 68 per cent. The advance in large towns was 71 per cent and in small towns and villages 66 per cent. From the beginning of the war the prices of bacon, flour, sugar, eggs, and various meat products had more than doubled. It was estimated that the cost of living, including food, rent, clothing, fuel, light, and miscellaneous items, had increased 50 per cent from July, 1914, to Oct. 1, 1916.

Near the end of November the British government entered upon a policy of rather extensive food control. This policy was adopted in view of the soaring prices and especially on account of the harvest shortage in Canada and the United States. The Board of Trade was given very wide powers for the accomplishment of the following objects: to prevent waste; to restrict the use of any article; to regulate the manufacture and production of articles; to direct their sale and distribution; to regulate market operations so as to prevent price inflations; to fix maximum prices; to require owners of supplies to place them at the disposal of the board; to make a careful census of all available supplies; and to enter premises where articles are kept, stored, manufactured, or produced. It was expected that numerous measures designed to restrict luxurious living would be adopted. The first orders limited the retail price of milk to 2d. per quart above the price in the corresponding month before the war, virtually fixing 6d. per quart as the maximum; and established standard percentages of flour that must be extracted from the various grades of wheat.

**STATE COMMISSIONS.** About the 1st of December Governor McCall of Massachusetts appointed the following to constitute a High Cost of Living Commission to investigate and make public its findings regarding higher prices: James J. Storrow, a prominent business man; Francis X. Tyrell, chairman of the former State Board of Economy and Efficiency; Prof. Melvin T. Copeland of Harvard University; and Robert Luce, and Edward F. McSweeney, both members of a former similar commission. On December 27th this Commission issued a published report dealing with the coal situation. It favored Federal regulation of the mining and transportation of anthracite coal and State regulation of its sale. It recommended that Federal authority should supervise the distribution of coal cars, and fix the maximum price at the mines; and that the anthracite coal business should be completely separated from railroad control. While the report exempted local dealers for the most part from any charge of extortion it recommended that the Legislature should give the Gas and Electric Light Commission authority to license coal and coke dealers; and favored a law compelling such dealers to sell coal in 25 pound lots at the ton rate, and to require gas companies to give preference to coke orders of 100 pounds or less.

In New York on December 31st was issued a joint report by a Market Commission appointed

by Governor Whitman, a Food and Market Committee appointed by Mayor Mitchel, and the Weeks Legislative Committee. This recommended the creation of State, city, interstate, and local commissioners of markets to check waste and excessive profits in food handling, cheapen transportation and marketing, and educate farmers in buying and consumers in selling. It strongly favored the formation of food producers into coöperative selling and distributing societies. This would, for example in the milk supply, eliminate the costs of getting business and the duplication of delivery routes. Among the causes of higher prices this report mentioned the war and the consequent increase in exports of food (\$172,000,000 in the first nine months of 1914 and \$337,000,000 in the same months of 1916); decreased production in some lines; ignorance and extravagance of housewives; and expensive methods of retail distribution. See **NEW YORK.**

**CENTRAL POWERS.** Reports regarding the level of prices and the condition of the food supply in Germany and Austria were very conflicting. While one report would seem to indicate that large portions of the population were on the verge of starvation others indicated that there was an adequate supply of fundamental foods at prices within public reach. Investigations made by university professors in Germany regarding the growth and weight of children were reported to indicate that although weights averaged slightly below normal there were no evidences of injury to growth. In both Germany and Austria centralized control of food supplies and their distribution was carried to the highest degree of completeness. In Austria-Hungary on December 23rd was promulgated a law prohibiting the importation of all articles of luxury, including fruits, wines, chocolate, silk, furs, toys, jewelry, musical instruments, and perfumery. One object of this law was to check the decline in exchange rates. Calculations based on the normal family food budget seemed to indicate that in Berlin prices were about 125 per cent higher than in July, 1914, while in Vienna they were 178 per cent higher. Hungarian papers asserted that food prices had more than doubled and that starvation was a real danger. It was known that in all of these countries there was an almost complete absence of fats and that some other foods had practically disappeared. See **AUSTRIA-HUNGARY and GERMANY, History.**

**OTHER COUNTRIES.** According to calculations reported in the *Monthly Review* of the Bureau of Labor Statistics in November the increase in prices in various countries up to certain months of 1916 was as follows, the general average of prices for 1913 being equal to 100: Australia, April, 143.6; Canada, August, 117.6; France, February, 132.3; Italy, May, 128.9; Netherlands, June, 147.4; New Zealand, July, 123; Norway, June, 172.8; and Sweden, June, 136.9.

**PRIMARY, DIRECT.** See **ELECTORAL REFORM.**

**PRINCE EDWARD ISLAND.** One of the Maritime Provinces of Canada, the smallest in the Dominion. The island lies east of New Brunswick and north of Nova Scotia. Area, 2184 square miles. The capital is Charlottetown. Between 1901 and 1911 the population decreased 9.23 per cent, or from 103,259 to 93,728. In 1911 Charlottetown had 11,198 inhabitants; Summerside, 2678; Souris, 1089. Of the

population 10 years of age and over in 1911, 36,832 (50.02 per cent) were males, and 36,796 (49.98) females; of these, 27,956 males and 3950 females were reported as employed in gainful occupations. Of the males employed, 68.4 per cent were in agriculture (the highest percentage in the Dominion), 6.5 in manufacturing, and 6.2 in building trades; of the females, 39.5 per cent were in personal and domestic service, 18.9 in manufacturing, 16.6 professional, 14.7 in agriculture, and 8.6 in trade and merchandising.

The provincial government is administered by a lieutenant-governor, appointed for five years by the Governor-General of the Dominion; he acts through an executive council, or responsible ministry. The Legislative Assembly is a single chamber of 30 members, elected for four years, half of them by real-property holders and half by manhood suffrage. In the 12th Parliament, which convened in 1911, the province was represented by four Senators and four members of the House of Commons; the representation in the Commons on the basis of the 1911 census is three. The Lieutenant-Governor in 1916 was Augustine Colin Macdonald, appointed June 2, 1915, in succession to Benjamin Rogers.

**PRINCETON UNIVERSITY.** A non-sectarian institution for the education of men, founded in 1746. In the fall of 1916 the total enrollment of students was 1555 and the faculty numbered 199. The following are the more important additions made to the faculty during the year: Dr. Charles Carroll Marden, Emory L. Ford professor of Spanish; Capt. Stewart Heintzelman, U. S. A., detailed by the War Department as professor of military science and tactics; Dr. John Bauer, assistant professor, preceptor in economics and social institutions; Dr. Henry B. Dewing, assistant professor, preceptor in classics; Dr. Horace Craig Longwell, assistant professor, preceptor in philosophy; and Dr. Norman Brown Tooker, assistant professor of hygiene and physical education. The university library contains 383,700 volumes. It was expected that the new dining halls, erected at a cost of \$500,000 (one-half of which amount was given by Mrs. Russell Sage and the other half by alumni and others), would be entirely completed during the academic year 1916-17. At the end of 1916 portions of the halls were already in use. During the year William W. Lawrence left his estate of \$1,000,000 to the university; Emory L. Ford, of the class of 1896, gave \$100,000 to endow a professorship in Spanish; and Henry C. Frick presented to the university a fine pipe organ which was erected in the Procter Dining Hall of the Graduate College. Mr. Frick also gave \$100,000 to endow the organ, together with a chair in the history and theory of music. Mrs. Marie A. Fisk bequeathed about \$115,000 for dormitory construction purposes, and Edward Plaut established the Albert Plaut Memorial Library of Chemistry. Plans were made for a new Athletic Field, to be called Poe Field. The president of the university is John Grier Hibben.

**PROSTITUTION.** The active campaign against prostitution which has been carried on during recent years in the United States continued in all parts of the country during 1916. This movement has taken on the broad character of a public health or social hygiene movement and consequently has enlisted the active support not merely of moralists but of medical associations and numerous societies for social and moral prophylaxis. In New York City the most active work is done by the Bureau of Social Hygiene (q.v.). In the country at large the most important organization is the American Social Hygiene Association which publishes a monthly *Bulletin* and a quarterly, *Social Hygiene*, of which the second volume appeared in 1916. Its branches in many of the leading States are active centres of local agitation. Those in Connecticut, Illinois, Massachusetts, New York, and Oregon have been notably effective. In consequence of the enactment in 1912 of the Mann White Slave Act forbidding any transportation of women for immoral purposes from one State to another there have been enacted similar laws by State Legislatures applying to similar transportation within their own boundaries. But the most important laws of the States have been the injunction and abatement laws which in various ways provide for the punishment of owners of property used in connection with social vice. Such laws are now in operation in at least 23 States.

**SOCIAL HYGIENE.** The annual meeting of the American Social Hygiene Association was held at St. Louis November 19th to 21st. It gave chief attention to the development of means for the exchange of ideas and experience among social workers and endeavored to forward the movement for social hygiene legislation in Missouri. The papers dealt with the progress of social hygiene and its relation to public health and vice repression; to the growth of public opinion with reference to the importance of venereal infection; to the medical aspects of social hygiene, in which special emphasis was given to the need of free and convenient facilities for diagnosis and treatment of infected persons; to education of people in all ages, in which it was emphasized that the home is the natural agency for such instruction; and to the repression of commercialized vice, particular attention being given to organized study and the perfection and enforcement of injunction and abatement laws. Abram W. Harris was chosen president for 1917. This association, together with its numerous State branches, has given especial attention to the cultivation of an informed public opinion regarding all phases of abnormal sex tendencies. Its publications in particular have devoted great attention to the education of youth in home and school. It was the medium through which the Metropolitan Life Insurance Company awarded a prize of \$1000 to Donald B. and Eunice B. Armstrong for the best statement of methods of instructing boys and girls from 12 to 16 in sex problems, published in *Social Hygiene*, July, 1916. In addition the American Association has

issued some 85 pamphlets dealing with nearly every question connected with the entire field of prostitution, venereal diseases, and sex education.

**VARIOUS CAMPAIGNS AND RESULTS.** The most successful of all of the State societies has been the Oregon Society, which has succeeded in arousing the united support of public opinion and newspapers in the suppression of quack advertisements and the conduct of a vigorous campaign of publicity. The Missouri Society, formed in November, had been preceded by numerous active local societies and began the prosecution of an active campaign for an injunction and abatement law and for the creation of public opinion. The Connecticut Society issued during the year a pamphlet entitled *For Parents* in English and the following foreign languages: Polish, Slavic, Hungarian, Italian, French, and Greek. The New York Society conducted a "Health Exhibit for Men" at Coney Island during the summer. In Delaware the State Society carried out an educational campaign in cooperation with women's clubs and school authorities. In Buffalo an active agitation was carried out by the Federation of Churches. At Kansas City the local Society for the Suppression of Commercialized Vice, formed in 1913, secured the creation of a "vice squad" in the police force; conducted numerous public meetings; and took advantage of the Billy Sunday campaign to enforce its ideas.

The Cleveland segregated district was closed early in 1915. The Lakeside Dispensaries situated near the old segregated district reported that eight months previous to this closing there were 112 listed cases of infection for venereal diseases, of which 42 per cent were contracted in the segregated district, whereas in eight months after closing there were only 18 listed and 35 unlisted cases. At Syracuse, where the segregated district was closed in 1913, there had been made three inquiries into the prevalence of venereal diseases. These showed that since 1910 up to the close of 1915 there had been a reduction of 27.7 per cent in the prevalence of gonorrhoea and of 45.4 per cent in syphilis. The reduction in the latter was attributed primarily to closing the segregated district, while the reduction of the former was due to better control of the liquor trade and disorderly hotels.

The report of the Baltimore Vice Commission published late in 1915 startled the country. On the basis of it the Society for the Suppression of Vice in Baltimore City prosecuted a most vigorous and effective agitation. It reported the following "Points Gained": all public houses closed; inmates offered an opportunity to enter an honest life; closing of assignation houses; lessened street walking; practical elimination of the white-slave traffic; reduction in social diseases; an improved morale of the police force. At Chicago the abolition of the segregated district necessitated the continuance of a fight against prostitution under numerous evasive forms. The Committee of Fifteen, however, kept up its investigations throughout the city in an effort to ferret out places being used for vice purposes. The enactment of an injunction and abatement law effective July, 1915, enabled it to force property owners to evict tenants without active prosecution in most cases. It was vigorously opposed by the Chicago Hotel Keepers' Protective Association. The committee

found, however, that convictions for pandering became more and more difficult with the increase of evasiveness of methods. It charged the police with "inefficiency and positive corruption." The Chicago Board of Education cooperated with the committee in investigating the character of houses near public schools. In Wisconsin the Psychiatric Institute at Mendota, a State research institution, authorized to make Wassermann and cerebrospinal fluid examinations free of charge, actively stimulated a great increase of such examinations throughout the State. Its record showed that out of 2500 cases of insanity in two State hospitals 13 per cent gave positive Wassermann reactions upon admission: of 600 cases of feeble-minded, 20 per cent; of 900 convicts in the State prison, 11 per cent. The Detroit Board of Health in its bulletin for March presented the results of extensive examinations of prostitutes and the following conclusions: most cases of venereal disease are due to illicit sexual intercourse; inmates of known houses of prostitution are only a partial factor in such contagion; repeated illicit intercourse will result in gonorrhoea or syphilitic infection in 94 per cent of cases.

**ABROAD.** War conditions raised tremendous problems of social hygiene in all belligerent nations. The military authorities of Germany, France, and Great Britain were especially active in carrying out every known device for prophylaxis and in the systematic examination and treatment of all known cases. Even in Holland, where the mobilization of considerable bodies of troops had been found necessary, the spread of prostitution and infection made regulation a primal necessity. In Germany clinics for diagnosis and advice were opened in Bremen and Berlin. In Great Britain the report of the Royal Commission on Venereal Diseases, published in 1915, contained an investigation covering the entire country. It recommended the establishment of free laboratory diagnosis and adequate skilled free treatment of all infected persons; and that the Local Government Board be authorized to meet 75 per cent of the expense from Imperial funds. It laid great stress upon the relation of alcohol to venereal infection. In New South Wales a committee modeled after the British Commission was authorized in July, 1915. Its first report showed the lack of statistics; the inadequacy of medical examination of prostitutes; the necessity of free public laboratory diagnosis for syphilis; the need for special instruction of nurses and the public; the desirability of protecting marriage by a special certificate; the necessity of requiring public reports of all cases of infection; and otherwise treated nearly every phase of the entire problem.

**ILLINOIS.** The Illinois Senate Vice Committee, created in April, 1913, and headed by Lieutenant-Governor O'Hara, issued a report of nearly 1000 pages in January. Among its conclusions were the following: poverty, directly and indirectly, is the principal cause of prostitution; thousands of girls enter prostitution because of inability to keep body and soul together on the low wages they receive; the low wages of fathers force many girls into industry, with consequent insufficient schooling, separation from home and adequate protection, thus becoming recruits for the system of prostitution; unregulated conditions of domestic labor result

in many servants entering commercialized vice; the system of segregation is a complete failure because it increases immorality and spreads degeneracy; many women desiring to supplement allowances of husband or parent are entering the so-called "call girl" system which has rapidly spread in recent years; the sale of intoxicants together with public dancing is a strong contributory cause; the highest standards of morals exist among girls in high schools and colleges; the proper treatment of women of the underworld would restore a large proportion to decency. See SOCIAL HYGIENE, BUREAU OF.

**Bibliography.** In addition to the publications above mentioned and numerous articles in public health reports, bulletins of the National Conference of Charities and Corrections, and numerous journals, the following publications were issued: Maurice A. Bigelow, *Sex Education*; Maude E. Miner, *Slavery of Prostitution*; W. Grant Hague, *The Eugenic Marriage* (4 vols.); The Oregon Social Hygiene Society, *Five Years' Work in Oregon*; Ernest R. Groves, *Moral Sanitation*; *Reports* by vice commissions in Bridgeport, Conn., and Paducah, Ky.; J. G. Fertig, *Commercialized Prostitution in St. Louis*.

**PROTEINS.** See ANAPHYLAXIS.

#### PROTESTANT EPISCOPAL CHURCH.

The total number of communicants in this denomination in the United States in 1916 was 1,066,970, an increase of 26,074 over 1915. The total number of communicants in the world was 1,086,089, an increase of 27,285 over 1915. In the Sunday schools in the United States were enrolled 53,389 teachers and 473,030 scholars. The total number in the world was 54,369 and 495,750 respectively. The total number of the clergy in the United States was 5598. The total number in the world was 5874. There were, in the United States in 1916, 433 candidates for orders and 444 in the world. The total contributions of the denomination for all purposes in 1916 amounted to \$20,124,013. There were, in 1916, 91 dioceses in the Protestant Episcopal Church in the United States, and 12 dioceses in foreign countries. The missions of the denomination are under the control of the Domestic and Foreign Missionary Society. The amount received for missionary purposes in 1916, including the emergency fund, was \$1,248,654.

During 1916 the Church lost by death three of its bishops: Bishop Brewer of Montana; Bishop Ferguson, missionary bishop of Liberia, west Africa; and Bishop Peterkin, of West Virginia. The bishops elected during 1916 were: Benjamin Brewster, bishop of Maine; Hugh Latimer Burleson, missionary bishop of South Dakota; Irving P. Johnson, bishop coadjutor of Colorado; James Wise, bishop coadjutor of Kansas; Frank Hale Touret, missionary bishop of Western Colorado; William F. Faber, coadjutor bishop of Montana, succeeding Bishop Brewer as bishop of Montana; Bishop W. L. Gravatt, coadjutor, succeeding Bishop Peterkin of West Virginia as bishop. The resignations of Bishop Osborne of Springfield, Ill., and Bishop Johnston of West Texas were accepted.

The General Convention of the Protestant Episcopal Church was held at St. Louis, Oct. 12-27, 1916. The attendance was large and well maintained, and the discussions marked by intellectual strength and catholicity of spirit. It was feared at first that the dispute over the Panama Conference, which brought out strong

differences between the High Church (or American Catholic) element and their opponents, might find its way into the Convention and produce strife; but this was happily averted. Opportunity was given for the expression of opposing views similar to those which had previously been expressed, but no crisis was precipitated, and such were the good temper and judgment displayed that the Panama question may be said to have faded from public view. The missionary work was vigorously emphasized. The Board of Missions made great progress during the year in vivifying the methods and spirit of a broad, national policy, and its efforts were approved with enthusiasm by the Convention. The work of Prayer Book revision was taken up with resolute deliberation, and a new Hymnal was adopted. The spirit of the Convention was that of consecration and efficiency, although in some respects the decisions were apparently conservative. Women were refused admission as delegates to the General Convention. The attempt to secure proportional representation of dioceses in the General Convention was defeated. Amendments to the canon on marriage and divorce, refusing re-marriage to all divorced persons, were lost. The Panama Canal Zone was created a missionary district. Endorsement was given to Armenian relief, to the Actors' Church Alliance, to temperance legislation and personal abstinence, to the censorship of moving pictures, and to the consolidation of the activities of the Board of Religious Education. Suffragan bishops were refused a vote in the House of Bishops. A board of 18 trustees for the pension fund was given full power to administer the same when effective. New commissions were appointed on home and family life, to promote peace and international friendship, and on parochial missions. A resolution was passed permitting Jewish communicants to observe racial and national festivals. A commission was appointed to visit Liberia, Central French Africa, and the Sudan; it was composed of Bishop Francis of Indianapolis, Rev. Harvey Officer, and Dr. James H. Dillard. Bishop Gailor was elected chairman of the House of Bishops. The next General Convention will be held at Detroit in 1919. See OLD-AGE PENSIONS.

**PSYCHICAL RESEARCH.** Mrs. H. Sidgwick (*Proc. S. P. R.*, 28) discusses the psychology of Mrs. Piper's trance-phenomena on the basis of all published records and of the unpublished accounts left by the late R. Hodgson. She thinks it probable that Mrs. Piper's trance is a state of self-induced hypnosis, in which the medium personates various characters. The hypnotic state brings with it an enhancement of the mental powers, in certain directions, above the normal level; in particular it enables the medium to receive telepathic communications. H. Bruce publishes a revised edition of his *Riddle*

of *Personality* (1908). In *Patience Worth* C. S. Yost reports automatic communications obtained by means of the ouija-board. The writing is done by a Mrs. Curran, a woman of education, but without special knowledge of English history or literature. She does not fall into a trance, and there is no hint of fraud or mystery in her performances. The communications, given in the name of "Patience Worth," a young English-woman of some three centuries ago, are characterized by words of Anglo-Saxon and Norman origin; they consist of conversations, epigrams, short poems, a long medieval drama, a long tale of a farm-lass "Telka," etc.; and the editor finds in them a high literary quality. Sir Oliver Lodge (*Raymond, or Life and Death*) prints a selection of letters which show the personality of his dead son, offers samples of evidence he has obtained for the survival of memory and affection after death, and enters at some length into the general logic of the hypothesis of continued personal existence. The most impressive evidential incident is the discovery of a group-photograph, taken in Flanders and wholly unknown to the family, whose details (including Raymond's place and attitude) were correctly described by two "sensitives."

The same writer (*Nineteenth Cent.*, 79) quotes Ovid's tale of Ceyx and Alcyone to prove the poet's familiarity with veridical death-wraiths and the acceptance, in the ancient world, of a mode of thought-transmission akin to what we now term telepathy. L. J. Martin (*Ps. Rev.*, 23) investigates a case of reputed prophecy of the California earthquake of 1906. The "prophecy" was based partly on scientific inference, partly on a process of constructive imagination whose motives are made clear; there was no premonition.

**PSYCHOLOGICAL ASSOCIATION, AMERICAN.** The 25th annual meeting was held at Columbia University, December 27th-30th, under the presidency of Prof. R. Dodge (Wesleyan). The 25th anniversary of the founding of the association was celebrated by a banquet on the evening of December 28th; Prof. M. W. Calkins (Wellesley), Pres. G. Stanley Hall (Clark), Prof. G. T. Ladd (Yale), and Pres. E. C. Sanford (Clark College) were the principal speakers.

**PSYCHOLOGY.** The influence of the war was still severely felt. Practically no books or periodicals were received from Germany; the Italian *Psiche* and two at least of the better known French periodicals seem to have suspended publication. In America, on the other hand, a new bi-monthly, *The Journal of Experimental Psychology*, appeared under the editorship of Professor Watson (Johns Hopkins).

Prof. O. Külpe (q.v.) of Munich, known by his contributions to psychology and theory of knowledge, the founder of the "Würzburg school" of experimental psychology, died at the age of 53. Prof. H. Münsterberg (q.v.) of Harvard, a distinguished psychologist and metaphysician, widely known in recent years by his studies in applied psychology, died suddenly at the same age. The science has also suffered by the death of E. Mach (q.v.), formerly professor of the history and theory of inductive science at Vienna; J. Royce (q.v.), professor of philosophy at Harvard; G. Ballet (q.v.), author of *Le langage intérieur*; N. Oppenheim, writer on the hygiene and development of the child;

A. Charpentier, authority upon psychological optics; and T. A. Ribot (q.v.).

**GENERAL BOOKS AND TREATISES.** W. B. Pillsbury's *Fundamentals of Psychology* is a textbook in general psychology written from the standpoint of an inclusive behaviorism. H. S. Langfeld and F. H. Allport published an *Elementary Laboratory Course in Psychology* which outlines 30 illustrative experiments.

The year showed a renewal of interest in motor theories of consciousness, and a decrease of interest in behavioristic theory. H. C. McComas (*Ps. Rev.*, 23) argues against the motor theories of Dewey, Münsterberg, and Judd on the logical ground that they ascribe inferentially to a whole class what we know to belong only to a part, and on the factual grounds that they overlook the extreme complexity of the human nervous system and assign to the motor areas an unwarranted importance for consciousness. C. Rahn (*Ps. Rev. Mon. Suppl.*, 21, 4) agrees with Stumpf and Titchener in rejecting the principle of dynamogenesis. Consciousness he believes to occur, not in connection with movement, but at the point of inhibition of overt behavior. M. F. Washburn, on the other hand, attempts in *Movement and Mental Imagery* not only to find middle ground between opposing motor theories but also to sketch a new hypothesis that shall answer for the higher processes at large. Consciousness depends upon a certain ratio between excitation and inhibition of the motor response to a stimulus. It may appear when the initiation of a motor response is too slight to arouse actual movement; at this level there is, however, no association, since association of ideas is conditioned upon association of movements. If the response involves, simultaneously, both consciousness and association, we have attention. If it is adequately initiated and entirely unopposed, so that there is no delay, we have habitual action without consciousness. "Tentative" movements, so slight as almost to escape introspection, furnish the unanalyzed residual contents of "imageless" processes. The "image" occurs when a sensory excitation is debarred from its usual motor outlet and passes through other sensory centres on its way to an unaccustomed path of motor discharge. All this is confessedly hypothesis; but the author is able by means of it to attack some of the most difficult problems of human and animal psychology, and thus to make a notable advance upon current motor theory. E. S. Abbot (*Ps. Rev.*, 23), urging the need of a functional psychology of the entire organism, recommends the adoption of a biological point of view in psychology and psychiatry. J. B. Watson (*J. Ph. Ps. Sci. Meth.*, 13) would substitute the concepts of behavior for those of mental disease, and (*Ps. Rev.*, 23) would replace the method of introspection in human psychology by that of the conditioned reflex. A. Myerson (*Coll. Contrib. State Board of Insanity*, etc., Boston, Mass.) gives a general account of this type of reflex and of the theories which Pawlow has based upon his study of it; and K. S. Lashley (*Ps. Rev.*, 23) discusses the human salivary reflex and its possible uses in psychological investigation.

**SENSATION.** General. C. Rahn (*Ps. Rev. Mon. Suppl.*, 21, 4), writing upon "Sensation and its Physiological Conditions," finds a growing tendency to include central nerve-processes among the direct conditions of sensation. J. N.

Curtis (*Am. J. Ps.*, 27) undertakes an experimental study of "Duration and the Temporal Judgment." Duration may be either static length or moving progression. A sensation, taken as it immediately comes under an existential determination, merely "goes on"; duration is here attributive. When, however, the determination is to compare or to estimate, the durative experience becomes a perceptual length, realized as a whole when the progressive movement is completed.

**SMELL AND TASTE.** The outstanding work of the year is that of H. Henning (*Zts. f. Ps.*, 73, 74). Experimental psychology has been content, in general, to accept Zwaardemaker's revision of the old Linnæan classification of odorous qualities, and the same investigator's results in the matter of olfactory mixtures and compensations. Henning, after trial of over 400 stimuli, proposes a new classification. There are six fundamental qualities: fruity (lemon), putrid (H<sub>2</sub>S), flowery (violet), resinous (frankincense), scorched (tar), and spicy (nutmeg); these examples are typical only). The whole body of olfactory qualities, fundamental and intermediate, may be arranged on the surface of a triangular prism. At the six angles stand the pure fundamental odors (not yet definitely determined); along the edges, diagonals, and other cross-lines of the surface lie the qualities which "resemble" two or more of the fundamental qualities. These intermediate qualities are all psychologically simple; their relation to the fundamentals is analogous to that of a tone to the limiting tones of the octave within which it is placed. The basis of classification is introspective, though Henning hints also at a chemical correlation; likeness of inter-molecular combination appears to parallel likeness of olfactory quality. In the matter of mixture, Henning denies outright the analogy of odor and color: the olfactory experiences which result from dual stimulation resemble rather the tonal fusions, and like these evince degrees of fusion, ranging from the "combinational odor" to less unitary forms. In general, any olfactory quality may fuse with any other; but the nature of the fusion depends upon the nearness or remoteness of its components in the olfactory series. The various fusions may be represented, geometrically, on lines connecting the components and drawn across the interior of the prism.

The treatment of taste is no less radical. Henning recognizes the four fundamental qualities of sweet, sour, bitter, and salt, but insists that they are connected by series of simple intermediate qualities, whose relation to the pure qualities is akin to that of the intermediate colors to the pure R, Y, G, B of the color-square. The whole system of taste qualities may be arranged on the boundary-lines of a tetrahedron, with the pure fundamentals at the four angles. The mixture of gustatory stimuli gives fusions which in every case are readily analyzable; they may be represented on lines drawn through the body of the taste-figure.

This reformed psychology of taste and smell will not and should not command immediate assent; Henning's observations, especially those of olfactory mixture, must be repeated and varied. There can, however, be no doubt that the new classifications mark a definite advance in sense-psychology. Order has been brought, if not into chaos, at any rate into a very poorly

ordered field; and whether the arrangement be final or whether it prove to need modification, it affords a positive point of departure and point of attack.

**VISION.** E. M. Alapach (*Am. J. Ps.*, 27) brings experimental evidence of the psychological simplicity of the intermediate hues of the color-square and of green. J. Ward (*Brit. J. Ps.*, 8) and E. B. Titchener (*J. Ph. Ps. Sci. Meth.*, 13) continue the discussion of the sensory character of black. C. A. Hegner (*Zts. f. Sinnesphys.*, 49) reports on congenital differences in the color-vision of the two eyes; anomalous vision or partial color-blindness in the one eye may consist with normal vision in the other. R. Strohal (*ib.*) describes experiments in support of Hering's theory of antagonistic visual processes, and J. von Kries (*ib.*) and K. L. Schäfer (*Arch. f. d. ges. Phys.*, 160) offer additional proof of von Kries's dual theory of vision.

P. F. Swindle (*Am. J. Ps.*, 27) describes a positive after-image of long duration, obtained with dark adaptation and intermittent stimulation. What seems to be the same phenomenon has been made the subject of systematic investigation by G. H. Miles (*Brit. J. Ps.*, 8), who distinguishes it from the after-image proper, and explains it on the basis of "changes in the intensity of light received on the total retina, and altered conductivity of that portion of the visual tract which was originally excited."

**AUDITION.** G. J. Rich, in a pioneer study of tonal volume, finds (*J. Exp. Ps.*, 1) an approximate constancy of the relative difference-limen, which differs from that of pitch both in magnitude and in course. J. Peterson (*Ps. R.*, 23) decides that binaural beats are neither true beats nor referable to bone-conduction: they are rather periodically perceived changes in the localization of tones. New proof of the objective nature of difference-tones is furnished by J. Wittmann (*Arch. f. d. ges. Ps.*, 34); the use of phonoscope and fluctuating flame enables him to secure a visual representation of these combinational tones, and to show that they take their origin either in the membrane of the capsule or in the flame itself. He finds, further, that if the relevant partials are eliminated by interference the difference-tones disappear.

**CUTANEOUS AND ORGANIC SENSATION.** It is still an unsettled question whether and how far our sensations of pain evince qualitative differentiation. E. Becher (who succeeds Külpe at Munich) has explored the surface of the body (skin and mucous membrane) by means of mechanical, thermal, and chemical stimuli, and concludes that superficial pain may be reduced, in general, to two qualities: a bright and not necessarily unpleasant pain, which derives from the skin proper, and a dull pain which is seated in the subcutaneous tissues. There are, however, three local areas—the external auditory meatus, the dentin of the teeth, and the *glans penis*—which appear to mediate bright pains of specific quality (*Arch. f. d. ges. Ps.*, 34).

Head's theory of protopathic and epicritic sensibility has been attacked from two quarters. H. Carr (*Ps. Rev.*, 23) criticises the theory on grounds both of logic and of observation; and E. G. Boring (*Quart. J. Exp. Phys.*, 10) has repeated Head's experiment under improved conditions, and reports his own observations of the return of cutaneous sensitivity after section of

a sensory nerve. Boring finds that the results which Head's technique threw into high relief lose their special importance in the light of a more refined method, and take their place in a total body of fact which shows no such line of cleavage as Head has described. He himself outlines a theory of multiple innervation of the sensory "spots"; the nerve-supply is so distributed that, under varying conditions, summation or inhibition of excitations may occur in varying degree. An hypothesis of this sort is adequate to the data of observation, and avoids the duplication of sensibilities which Head had been led to assume.

In *The Control of Hunger in Health and Disease* A. J. Carlson demonstrates that the gastric *mucosa* is insensitive to touch and pain; finds (in agreement with Boring: *YEAR BOOK*, 1915) that the thermal sensations of stomach and œsophagus are introspectively separable as regards localization and pattern; and establishes a correlation between hunger and contraction of the walls of the stomach. In psychological analysis, hunger is (as Boring had also discovered) simply a complex of pressure and pain. Carlson further maintains that hunger is experimentally distinguishable from appetite; appetite may, indeed, appear in the absence of hunger, and may be aroused by weak chemical stimuli which inhibit the hunger-contractions.

FEELING. W. S. Foster and K. Roese (*Am. J. Ps.*, 27) attack the tridimensional theory of feeling on its own ground. They put their observers under the conditions which Wundt describes as typical for the various primary feelings, and make the feelings which these conditions induce the standard of reference in detailed experimental work. The theory does not stand the test; strain, relaxation, excitement, depression prove all alike to be composed in good part of kinæsthetic sensations. E. Becher (*Zts. f. Ps.*, 74) classifies pleasantness and unpleasantness as form-qualities or founded contents.

ATTENTION. The complication-experiment continues to furnish problems. Dunlap declared, some years ago, that the temporal displacement depends rather upon eye-movement than upon accommodation of attention. C. S. Yoakum (*J. Exp. Ps.*, 1) confirms this result, in so far that fixation must be under exact control; he adds, however, that the positive after-image is a further factor of prime importance. This image, in its turn, is a function of the general attitude of the observer; and in fact the nature of judgment seems in all cases to be conditioned upon the observer's disposition toward the experimental situation. K. M. Dallenbach has applied his method for the measurement of attention to the field of cutaneous sensation (*Am. J. Ps.*, 27); the results bear out those obtained for sight and hearing. H. Woodrow (*J. Exp. Ps.*, 1), working by objective methods, finds (in agreement with introspective report) that visual outline is a determinant of attention; adds modality to the list of known determinants (touch is more compelling than sound, and sound than light); and offers evidence in support of the view that every individual has a special "power or faculty" of attention, which characterizes his mental constitution.

IMAGE. H. E. Burt (*Am. J. Ps.*, 27) studies the conditions of arousal of the primary visual memory-image. Favorable conditions are complexity of contour, size, time of exposure, in-

terest excited by the object, and motor reinforcement (tracing of the object); unfavorable are motor and mental distractions (adding of figures). The one common factor in all these cases appears to be attention: the greater complexity, the longer exposure, make for more vivid experience and therefore for more durable impression. H. Clark (*ib.*) classifies images under three headings as (1) those that are familiar and have a particular reference, (2) the unfamiliar, and (3) those that have a general reference. Eye-movements, to which the author devotes particular attention, condition changes in the clearness of the image, are more likely to occur in secondary than in primary attention; and, in so far as they are characteristic, are transferred to image from perception. H. S. Langfeld (*Ps. Rev.*, 23), discussing the function of the image, concludes that it serves as a cue to the touching-off of an organic response which, in turn, is the meaning of the situation.

PERCEPTION. O. Leeser (*Zts. f. Ps.*, 74) reports experiments on the comparison of lines and surfaces. The average variable error in the estimation of extents conforms approximately to Weber's law. The estimation of quadrilateral surfaces is not rendered more accurate if judgment is based on estimation of length of side or of diagonal. R. Peter (*Arch. f. d. ges. Ps.*, 34) investigates the relation of primary and secondary factors in the perception of depth. In monocular vision, with all secondary criteria save magnitude of visual angle eliminated, the object seen under the larger angle is judged to be nearer. G. E. Müller (*Zts. f. Sinnesphys.*, 49) seeks to explain the change of apparent direction of a vertical line (band of light in a dark room) with change of the position of the head. Perception proves to be conditioned upon three groups or systems of factors: the position of the head, the position of the eyes, and the carriage of the trunk. By reference to these three systems, together with associative factors, Müller is able to account for the typical differences in observed result. J. Peterson (*J. Ph. Ps. Sci. Meth.*, 13) refers certain experiences of loss of orientation to conflict of motor attitudes. O. Sterzinger (*Arch. f. d. ges. Ps.*, 35) compares the rhythmical and the affective impressions made by (successive) musical intervals. Every interval has its intrinsic rhythmical form; the higher tone (all other things equal) carries the accent. The rhythmical form depends upon the time elapsing between the tones; the neutral or indifferent time is about half a second; shorter times favor an iambic, longer times a trochaic or spondaic rhythm. The intervals fall into a series as regards definiteness of rhythm, the average order from best to worst being: fourth, sixth, fifth, third or seventh, second; the octave varies greatly in position with the different observers. The average order of affective impression (best to worst) is: fourth, third, sixth, fifth, and octave, second, seventh. The course of the two curves is strikingly similar.

F. C. Bartlett (*Brit. J. Ps.*, 8), who works with mutilated forms and blots of ink, infers from his results that the essential factor in an act of perception is the "effort after meaning." The sense-data offer themselves as familiar; and the subsequent effort to make this familiarity definite arouses the associative and apperceptive processes which are characteristic of the act of

perceiving. H. J. Watt (*ib.*), in a theoretical paper, develops the thesis that stereoscopy is a purely visual integrative process. In a third installment of his contributions to the psychology of form and movement, K. Koffka (*Zts. f. Ps.*, 73) presents a general criticism of the work, experimental and theoretical, of V. Benussi, who since the death of Witasek has become the standard-bearer of the Austrian school. Koffka believes that analysis into sensory components destroys the characteristic *quale* of perception; the immediate problem is to describe perception in terms of its own positive attributes.

**MEMORY AND RECOGNITION.** H. C. Warren (*Ps. Rev.*, 23) publishes the first part of an historical study of association, covering the systems from Plato to Hume. F. P. Boswell and W. S. Foster (*Am. J. Ps.*, 27) show that, in the case of learning a vocabulary, the intention permanently to retain increases the amount recalled. G. C. and C. E. Myers (*ib.*) sought to recall, under a persistent determination, stanzas of poetry, names of classmates, etc., that had long been "forgotten." All sorts of casual experiences served to revive the proper associations, and in the end a surprisingly large amount of material was reproduced. Diurnal variations in memory and association are noted by A. I. Gates (*Univ. of California Publ. in Ps.*, 1). M. H. and E. K. Strong (*ib.*) conclude from a study of reaction-times that recognition depends upon the rearousal of identical associations, and is to be understood as an awareness of the ease or difficulty of nervous (associational) discharge. L. V. Viqueira (*Zts. f. Ps.*, 73) finds that the recognition of a meaningless syllable is favored if it occupies its original position within some visual pattern.

On the side of theory, E. Jones (*Brit. J. Ps.*, 8) continues the discussion of the relation of depression to memory. R. Müller-Freienfels (*Arch. f. d. ges. Ps.*, 34) distinguishes three types of memory, which represent as many genetic stages: orienting memory, which expresses itself in attitudes (such as familiarity) and feelings (such as the vague feeling of change); reproductive memory; and productive memory, which freely combines the materials furnished by the lower type. E. Becher (*ib.*, 35), arguing that physiological hypotheses have broken down, outlines a "psychistic" theory of memory in terms of psychical residua (actuated by neural excitation) and mental association. S. I. Franz (*J. Exp. Ps.*, 1), taking as text the fluctuations shown by aphasics in the relearning of the names of objects, warns against the prevailing tendency to regard cerebral activity as exclusively mechanical.

**EMOTION.** In *Man: an Adaptive Mechanism* G. W. Crile (see YEAR BOOK, 1915) returns to the subject of the emotions, which he regards as modes of biological adaptation by means of the distance-receptors. Every emotion is a form of muscular activation, phylogenetically determined; appropriate stimulation of the distance-receptors "drives" certain organs (notably thyroid, liver, adrenals), with consequent exhaustion of the brain-cells. We are plainly on the disputed ground of the James-Lange theory, which J. R. Angell (*Ps. Rev.*, 23) regards as not materially affected by the work of Sherrington and Cannon.

**ABSTRACTION.** *Purpose.* S. C. Fisher (*Ps. Rev. Mon. Suppl.*, 21) has published a careful

and detailed study of *The Process of Generalizing Abstraction; and Its Product, the General Concept*. Four groups of meaningless forms were made the basis of the experiments, and the observers were required to frame a definition of every group-form. "The essence of the process of generalizing abstraction consists in a specific and characteristic mode of behavior in consciousness of a succession of imaginal or sensory contents, i.e. in their changing relative locality, and in their temporal aspects"; "this behavior of the contents of consciousness is immediately experienced as such." "The essence of the concept, as it occurred to consciousness under the conditions of our experiment, consisted in the fact that certain essential features, in varying structural form, entered consciousness in a specific manner when the situation demanded them. This 'specific manner' of entrance, or this 'behavior' in consciousness of the concretely or verbally imaged essential features, constituted fundamentally the experience of generality."

H. C. Warren's "Study of Purpose" (*J. Ph. Ps. Sci. Meth.*, 13) is concerned analytically with purposive consciousness and genetically with purposive activity. The discriminable factors in consciousness of purpose are forethought, assent, a feeling of potency, the self-notion, and the sense of fitness. Objectively, the whole sequence of events in growth and behavior appears capable of explanation in mechanistic terms.

**SOCIAL PSYCHOLOGY.** Wundt's *Elemente der Völkerpsychologie* has been translated by E. L. Schaub under the title *Elements of Folk Psychology*. H. K. Haberlin (*Ps. Rev.*, 23) subjects Wundt's doctrine to a trenchant criticism. Wundt defines the social mind as an over-individual synthesis, and as possessed of actuality, although in his psychological system actuality is immediacy of experience, and must therefore be individual. Furthermore, Wundt holds that the attributes of the social mind are to be determined by analysis of its products, while such analysis in Wundt's own hands shows that "the laws of folk-psychology which are supposed to characterize the attributes of the folk-soul, are . . . but applications of individual psychology." Haberlin believes that Wundt is led into these difficulties partly by the false analogy of the individual as synthesis of psychical elements and the group as synthesis of individuals, partly by a mistaken view of the relation between psychology and history. M. Bentley (*Ps. Rev. Mon. Suppl.*, 21) lays out a programme for constructive work in this branch of psychology. Social psychology rests upon mental "interaction," the nature of which must be empirically determined. The sources of enquiry are the human group, the individual regarded as member of a group, and the products of the group. The characteristics of two types of group, the congregate (individuals in physical proximity) and the assemblage (individuals subject to common social influences, but not physically conjoined), are worked out in some detail. Sample studies of the crowd and the audience are given by H. Clark and C. H. Woolbert (*ib.*).

G. O. Ferguson (*Arch. of Ps.*, no. 36) writes upon the psychology of the negro; and S. S. George (*Am. J. Ps.*, 27) corrects a current error with regard to the gesture of affirmation among the Arabs. E. B. Titchener (*Proc. Am. Ph. Soc.*, 55), relying on experiments of his

own, argues that the tests of color vision and tactile discrimination employed by Rivers and McDougall in Torres Straits were inadequate to their purpose. C. Read discusses the psychology of animism and the relation of animism and magic (*Brit. J. Ps.*, 8). A. J. Todd (*Am. J. Ps.*, 27) brings evidence to show that the primitive notion of the self is not individual but social. W. Trotter, in *Instincts of the Herd in Peace and War*, speculates upon the psychological aspects, the biological significance, and the sociological applications of the gregarious instinct, and explains certain racial differences, as displayed in the present war, in terms of aggressive, defensive, and socialized gregariousness. G. le Bon's *Psychology of the Great War* (translated by E. Andrews) is rather a discussion of the war by a psychologist than a positive contribution to social psychology.

**PSYCHOTHERAPY.** The year brought several translations of Freudian works: S. Freud, *Wit and Its Relation to the Unconscious* (A. A. Brill); *Leonardo da Vinci* (A. A. Brill); O. Rank and H. Sachs, *The Significance of Psychoanalysis for the Mental Sciences* (C. R. Payne); C. G. Jung, *Psychology of the Unconscious* (B. M. Hinkle). W. A. White's *Mechanisms of Character Formation* is an introduction to the theory and practice of psychoanalysis. The various psychoanalytical studies of genius have been brought together by L. Dooley (*Am. J. Ps.*, 27). The same author employed the method of word-association combined with introspection for the detection of Freudian complexes in the normal subject (*ib.*).

**MENTAL TESTS.** Present interest appears to centre in methodology rather than in result. Among the important books and articles of the year are: L. M. Terman, *The Measurement of Intelligence*; C. D. Mead, *The Relation of General Intelligence to Certain Mental and Physical Traits*; J. V. Haberman, "The Intelligence Examination and Evaluation" (*Ps. Rev.*, 23); T. H. Haines, "Relative Values of Point-scale and Year-scale Measurements of 1000 Minor Delinquents" (*J. Ev. Ps.*, 1); A. S. Otis, "Some Logical Aspects of the Binet Scale" (*Ps. Rev.*, 23). A. I. Gates's investigation of diurnal variations in efficiency (*Univ. of California Publ. in Ps.*, 2) shows the use of mental tests in the direct service of education.

E. Claparède's *Psychologie de l'enfant* has appeared in a fifth edition. New versions (E. S. Kite) have been published of two works by A. Binet and T. Simon, *The Development of Intelligence in Children* and *The Intelligence of the Feeble-Minded*.

**PURDUE UNIVERSITY.** A co-educational State institution at Lafayette, Ind., founded in 1869. In the fall of 1916 the total enrollment was 2178. There were 214 members in the fac-

ulty. Moses Fell Dunn of Bedford, Ind., left to the university a legacy of \$100,000. The productive funds of the institution amount to \$340,000 and for the year 1915-16 the total income was \$929,983. The library contains 55,000 volumes. President, Winthrop Ellsworth Stone.

**QUEBEC.** The largest province of the Dominion of Canada, extending from Ontario, the United States, and New Brunswick northward to Hudson Strait. The city of Quebec is the capital. Area, 706,834 square miles, of which 15,969 water. This area includes that portion of the Northwest Territories annexed to Quebec in 1912. Previously the area of the province was 351,873 square miles; between 1901 and 1911 the population of this area increased 21.49 per cent, or from 1,648,898 to 2,003,232. In 1911 Montreal, by far the largest city of Canada, had 470,480 inhabitants; Quebec, 78,710; Maisonneuve, 18,684; Hull, 18,222; Sherbrooke, 16,405; Westmount, 14,579; Three Rivers, 13,691; Verdun, 11,629; Lachine, 10,699; St. Hyacinthe, 9797; Sorel, 8420. Of the population 10 years of age and over in 1911, males numbered 737,401 (50.67 per cent) and females, 717,930 (49.33); of these, 552,140 males and 101,101 females were reported as employed in gainful occupations. Of the males employed, 36.5 per cent were in agriculture, 19.6 in manufacturing, 12.3 in building trades, and 11.2 in trade and merchandizing; of the females, 37.1 per cent were in domestic and personal service, 33.5 in manufacturing, 15.2 professional, and 9 in trade and merchandizing.

The provincial government is administered by a lieutenant-governor, appointed by the Governor-General of the Dominion; he acts through an executive council, or responsible ministry. The legislative power is exercised by two chambers, the Legislative Council and the Legislative Assembly. Members of the former, 24 in number, are appointed for life; members of the latter, numbering 81, are elected for five years. In the 12th Parliament, which convened in 1911, Quebec was represented by 24 Senators and 65 members of the House of Commons. The latter number remains constant, and the representation of the other provinces is proportionate, on the basis of population as ascertained at the regular decennial census. The Lieutenant-Governor in 1916 was P. E. Leblanc, appointed Feb. 10, 1915, in succession to Sir Francois Langelier.

**QUEBEC BRIDGE ACCIDENT.** See BRIDGES.

**QUEENSLAND.** The northeastern state of the Commonwealth of Australia, lying north of New South Wales and east of the Northern Territory and South Australia. The estimated area is 670,500 square miles, which is about 22.5 per cent of the area of the Commonwealth. The population according to the 1911 census was 605,813 (329,506 males, 276,307 females), exclusive of full-blooded aboriginals. The increase per cent in the decade 1901-11 was 21.62, in

1891-1901, 26.52, in 1881-91, 84.39. Estimated population, June 30, 1915, 689,678. The capital is Brisbane; its population at the 1911 census was 39,917; including suburbs, 139,480; estimate in 1914, 154,011.

The Chillagoe Railway, 103 miles long, was bought by the Government of Queensland for \$2,187,000. It has three branches, two of which belong to the State, which was forced to depend on the privately owned Chillagoe Railway to connect with the general government system. The third branch, the Mt. Mulligan line, was also owned by the Chillagoe Company.

The executive authority rests with a governor, who is appointed by the crown and is assisted by a responsible ministry. The Parliament consists of the Legislative Council and the Legislative Assembly. The Council consists of members nominated by the crown for life; their number is 36, but may be increased indefinitely. The Assembly consists of 72 members elected for three years by universal suffrage. The Governor in 1916 (from 1914) was Major Sir Hamilton John Goold-Adams, G.C.M.G.; Premier and Attorney-General, T. J. Ryan. See AUSTRALIA.

**QUICKSILVER (MERCURY).** The demand for quicksilver in 1915 was stimulated owing to the large consumption of the metal in the manufacture of war supplies, and the generally prevailing high prices resulted from the great demand. There were in 1915 39 producers of quicksilver in the United States. Of these 32 were in California, 4 in Nevada, and 1 each in Arizona, Oregon, and Texas. The total output in 1915 was 31,033 flasks of 75 pounds each, compared with 16,548 flasks in 1914. The production in California increased 26 per cent in quantity and 112 per cent in value in 1915. The exports of quicksilver in 1915 amounted to 33,725 flasks, valued at \$225,509. The imports amounted to 421,884 pounds, valued at \$282,752.

The domestic output of quicksilver in 1916, according to preliminary estimates made by the United States Geological Survey, amounted to 29,942 flasks, of 75 pounds each, valued at about \$3,643,800. This was the largest output since 1905. The States producing in order of rank are California, Texas, Nevada, Oregon, Washington, and Arizona, all of which increased their output except Nevada. The output for California in 1916 was 20,550 flasks valued at \$2,587,245, compared with 14,283 flasks, valued at \$1,174,881 in 1915. The combined output of Texas and Nevada was 7975 flasks, valued at \$1,004,052.

The price paid for quicksilver in 1916 was the highest in the history of the industry. The average domestic price for January was \$222 a flask. This increased to nearly \$400 a flask, but fell considerably, and the average price prevailing from July to December was about \$75 a flask.

**RABIES.** According to a bulletin of the Department of Health, city of New York, during the seven years preceding 1916 an average of more than 4500 persons have been bitten by dogs of that city as reported to the Department of Health. During the past year a report has been secured on each case, where practicable, of the circumstances under which the bites were received. Of over 3000 dog-bites reported since Sept. 1, 1914, at which time a special muzzling ordinance became effective, over one-tenth of the cases were attacked by dogs while leashed; an-

other 10 per cent of bites were inflicted by dogs supposed to be effectively muzzled. In over 200 cases the dogs were both leashed and muzzled. In other words, nearly 1000 persons were bitten in New York City under conditions in which attacks are supposed to be impossible, because of leashing, or muzzling, or both. These figures apparently show that many muzzles fail of their purpose, and do not prevent the infliction of bites by the animals so restrained.

There was an epidemic of hydrophobia in California, 33 cases being reported. Twelve of the victims were bitten in the face, one was bitten through the tongue, and the others on various parts of the body. The earliest deaths occurred 16 days after the bite was received, both patients having been bitten on the face.

In the neighborhood of Paris there was a notable increase in the number of cases of this disease during 1916, seventeen cases being reported between March and July. This situation is attributed to the evacuation of houses in the military zone and the consequent increase of the number of homeless dogs. Measures looking to the destruction of unmuzzled dogs, and those without an owner, and the quarantining of suspected animals have been taken by the prefect of police.

D. L. Harris, professor of hygiene at the St. Louis University School of Medicine, published the results of an investigation of the treatment of rabies with a desiccated virus, comparing its effectiveness with the Pasteur method. The latter method begins with the injection of 1 cm. of spinal cord dried for 14 days, followed, day by day, for 18 to 21 days, with cord extract of increasing infectivity, the two-day cord being the most infective which he felt could be used without infecting the patient. The effect of these injections is that in the course of three weeks immune bodies appear in the blood; and those patients survive in whom the incubation period of the infection is longer than the time required for the establishment of an active immunity. This required time is from 15 to 20 days after the completion of the treatment. The success of the treatment depends, therefore, on the fortunate circumstance that in man the incubation period of rabies is seldom less than three or four weeks and is usually about seven weeks. Pasteur regards as complete failures only those patients who develop hydrophobia later than 15 days after the completion of the treatment.

Pasteur's scheme requires the daily inoculation of one or more rabbits and the removal of the cords. It is therefore expensive and demands facilities which are to be found only in well-equipped laboratories. Modifications of the method have had for their object the establishment of an immunity which would appear earlier and be greater than that afforded by the Pasteur treatment. Such modifications have been tried by Hogyes, Ferran, Proescher, Calmette, Fermi, Marie, and Cummings. The modification which Harris describes is founded on Shackell's very original investigations on the effect of desiccation *in vacuo* at a low temperature. This method has for its object the preservation of fixed virus, in order that it may be prepared in quantity and be always available for treatment. By using both brain and cord, enough material is obtained for 30 complete treatments with the virus from a single rabbit;

and since the material can be stored until needed, there is no waste, and no unnecessary work is required of the laboratory staff during periods when patients are lacking or very few in number. Furthermore, with this product, treatment may be administered in less than half the number of days required by the original method.

The preparation of the material is as follows: Brain and cord, stripped of pia and blood vessels, are ground in a mortar into a homogeneous, thick, paste-like mass; carbon dioxide snow, collected from a tank into a sterile cloth, is added to the paste until freezing is complete and until further grinding reduces the mass to a fine powder. This powder is transferred quickly to a cold beaker and placed in a Schibler's jar which has been submerged in a mixture of salt and ice ( $-18^{\circ}\text{C}.$ ). In the upper part of the jar is a beaker of concentrated sulphuric acid. A vacuum of less than 2 mm. is produced and the powdered brain is kept at  $-18^{\circ}\text{C}.$  in the salt and ice until desiccation is complete. A single brain and cord will be completely dehydrated in from 36 to 48 hours. If the brain and cord have been thoroughly ground, completely frozen, and absolutely dried at a temperature not above  $-18^{\circ}\text{C}.$ , the resulting powder will be almost as infective as the fresh untreated brain and cord. When kept *in vacuo* at  $0^{\circ}\text{C}.$  there is no appreciable loss in infectivity for several months. When kept in an ice box ( $8^{\circ}$  to  $10^{\circ}\text{C}.$ ) for 500 days this powder is five times as infective as an equal quantity by weight of Pasteur's cord that has dried five days. The value of this method is shown by the record of 1159 cases treated with but two deaths, in both of which the disease developed before the possibility of antibody formation.

Harris points out that the average time required for the complete administration of the treatment is less than one-half that demanded by the Pasteur method. The 936 patients treated by Couret and by himself averaged less than 10 days per patient, a saving of more than 9000 days of treatment over what would have been required had the Pasteur scheme been followed. This is a matter of great importance to those who are obliged to travel from home to the city for treatment. As a concrete instance, the State board of health of Indiana has a fund for caring for indigent patients while they are receiving antirabic treatment. In one year the amount spent by the State for board was \$900 less than it would have been had these patients received the usual Pasteur treatment.

The latest report of the Pasteur Institute (Paris) records 654 persons treated during the year 1915, with a single death. Among nearly 6000 persons treated in the past 10 years at the parent Pasteur Institute there have been only 11 fatalities. See also VETERINARY MEDICINE.

**RABINOWITZ, SOLOMON.** See ALEICHEM, SCHOLEM.

**RACING.** Thoroughbred racing had a banner year in 1916. Larger stakes were offered than in previous seasons and larger crowds patronized the sport. The greatest attendance of the year was that at the running of the Suburban Handicap at Belmont Park on Memorial Day when 40,000 persons gathered at the track.

August Belmont headed the list of winning owners with a total of \$69,450, the earnings of *Hourless* and *Friar Rock* contributing chiefly to

this amount. R. T. Wilson's horses brought him \$66,738, *Campfire*, the biggest winner of the year, accounting for \$48,868.

Other owners who reaped large harvests were: James Butler, \$59,565; H. P. Whitney, \$36,815; Emil Herz, \$35,355; H. G. Bedwell, \$24,825; J. O. Talbott, \$20,954; H. C. Hallenbeck, \$20,980; Marrone Stable, \$18,565; L. Wood, \$17,368; Andrew Miller, \$15,990; Brighton Stable, \$15,320.

*Campfire* and *Friar Rock* stand out as the best horses of the year, the former winning six races out of nine starts and the latter earning the distinction of being the first three-year-old to win both the Brooklyn Handicap and the Suburban Handicap.

The winners of the more important stakes in 1916 were: Metropolitan Handicap, H. C. Hallenbeck's *The Finn*; Futurity, R. T. Wilson's *Campfire*; Brooklyn Handicap, August Belmont's *Friar Rock*; Carter Handicap, E. B. Cassatt's *Trial by Jury*; Suburban Handicap, August Belmont's *Friar Rock*; Saratoga Handicap, August Belmont's *Stromboli*.

The leading jockeys of the year were F. Robinson and Johnny McTaggart, who together captured 297 first places.

Racing in Europe again suffered severely as a result of the war. In England the principal event was the running of the New Derby Stakes at Newmarket which were won by E. Hulton's *Fifinella*. The winning English owner was H. Ellis with a total of \$14,675. Richard Croker's horses took down \$12,125 in purses.

Trotting and pacing in the United States proved popular, more than 1000 races being held throughout the country. Thomas W. Murphy led the list of winning drivers with \$81,910. Walter R. Cox was a close second, his total being \$73,330. *Mabel Trask* carried off the palm among the trotters, her earnings amounting to \$33,320. Of the pacers, the best showing was made by *Miss Harris M.* with \$9527. Three trotting records were established. *Lee Azworthy* (stallion) covered a mile at Syracuse, N. Y., in 2 minutes, and at Lexington, Ky., in 1:59½; and the *Real Lady* (two-year-old) went a mile at Lexington, Ky., in 2:04¼.

#### RACQUETS AND COURT TENNIS.

Clarence C. Pell won permanent possession of the Gold Racquet trophy by defeating Joshua Crane in the final round of the tournament held at Tuxedo Park, N. Y., 15-8, 15-1, 15-3. The national amateur racquets singles title, however, went to S. G. Mortimer, who defeated Pell in the final round of the tourney held at Boston, by a score of 15-12, 15-2, 15-12. The doubles title was won by Lawrence Waterbury and J. C. Waterbury, who triumphed over G. H. Brooke and J. C. Wear at 15-10, 8-15, 15-4, 15-5, 15-11.

Jay Gould once more successfully defended his title in court tennis by coming out victorious over Joshua Crane in the final round of the tournament held at New York City. The score was 6-2, 6-3. In the court tennis doubles Jay Gould and W. H. T. Huhn captured the championship by defeating Charles E. Sands and Payne Whitney. The score was 6-4, 6-1, 6-1.

Walter Kinsella retained his professional laurels as a result of his victory over Cecil Fairs of London, England, the score being 6-4, 6-4, 6-0.

The amateur squash championship was won by S. W. Pearson, who defeated C. R. Drewry

15-9, 15-3, 15-10. The national title went to Jack Soutar after a hard battle with William Ganley. The score was 14-17, 14-15, 18-15, 15-12, 15-10. Walter Kinsella was the winner of the professional championship. He defeated S. J. Feron in the series held in New York City by a score of 15-7, 15-6, 15-7, 15-9, 15-3, 15-4.

**RADCLIFFE COLLEGE.** A non-sectarian institution for the education of women at Cambridge, Mass. It is affiliated with Harvard University and was founded in 1879. In the fall of 1916 there were 126 graduate students, 481 regular students, and 65 special students. The faculty numbered 140. The largest bequest received by the college during the year was \$32,000 from the estate of Helen Collamore. Later \$20,000 will be available from a trust fund created by Miss Collamore. Construction was begun of a wall to surround the college grounds and of gates, the first part of the work being provided for by gifts of relatives and friends of Mrs. Agassiz and Miss Irwin. The college is residuary legatee (to the amount of about \$250,000) of Abigail W. Howe, who died in 1916. The productive funds of the college amount to \$1,045,000, from which it drew an income in 1916 of \$62,000. The library contains 38,000 volumes. President, Le Baron Russell Briggs.

**RADIATION.** See PHYSICS.

**RADIOACTIVITY.** See PHYSICS.

**RADIO-TELEGRAPHY.** See WIRELESS TELEGRAPHY AND TELEPHONY.

**RADIUM.** Studies in the activity of this element show that there are three types of radiations given off by radium: (1) The Alpha rays, which are chemically most active, but have slight power of penetration, are almost completely absorbed by the containers in which radium salts are commonly held, and therefore do not affect external objects. (2) The Beta rays, which are chemically less active and less absorbable. (3) The Gamma rays, which are similar to the hard Roentgen rays, being probably even more penetrating than the latter. The beta rays can be separated from the gamma rays in a magnetic field, since the former are thereby deflected.

In general, slight exposure to radium emanations stimulates vital processes, whereas intense exposure inhibits or retards them. The retardation may be cumulative and persistent through several generations of cells. Many investigators have been studying the biological effects of radium rays on living matter, but arriving at diverse conclusions. Schwarz believes that radium decomposes the lecithin in the cells. Hertwig and his pupils conclude that directly and chiefly radium affects the chromatin of the cells. Packard suggests that the lytic enzymes in the cells, rather than the synthesizing enzymes, are stimulated, and that by activating autolytic enzymes which effect degeneration of the complex proteins radium acts indirectly on the chromatin and the protoplasm. Recently Packard has set forth the results of a study of the effects of beta and gamma rays on protozoa and on the egg cells of sea urchins and other low forms of life. He observed that not only do cells differ from each other in their susceptibility, but that each cell seems to vary in this respect during different phases of its own activity. Some protozoa are entirely un-

affected by long and vigorous radiation, while others are killed by comparatively short exposure. In some cells the chromatin is chiefly affected, in others the protoplasm. Packard believes that those cells which are injured contain substances which absorb the rays, while those which are unaffected allow the rays to pass through unchanged. The factor which still remains to be discovered is the material which determines the power of absorption. It thus appears, from a medical point of view, that until more is known about the influences which determine absorption and penetration of the various radiations, it will be impossible to predict the effect of a given exposure to radiation, and treatment, therefore, must remain more or less empirical.

**RAILWAY ACCIDENTS.** While the conditions of railway operation in the United States were far more active in 1916 than in previous years, yet a reasonably good record for safety was maintained and a spirit of increased caution was prevalent. Many of the more flagrant conditions leading to accidents had been improved or at least appreciated, and there was a keen realization of the various defects of equipment and operation for which some solution must be sought. Thus in several instances, explained and unexplained, the human element figured, and the chances for man failure leading to serious accidents were realized as often more than a possibility that threatened. It was urged that relief should be sought with practical automatic train stops or other devices which for long lines had not been developed to the point where they could be generally adopted. Defects in rails and roadbed also were realized as likely to escape careful inspection and to develop possible failures that might be disastrous in their consequences, especially where heavy loads were the common rule and high speeds were maintained. With what results these efforts have been attended may be appreciated from the accompanying statistics of the Interstate Commerce Commission.

A serious source of fatalities and injuries continued to be the large number of trespassers who invaded the right of way and employed it as a walk. It has been difficult for the railways to secure the cooperation of local authorities in dealing with this nuisance which annually is responsible for the deaths of many children, not to mention adults.

While there were perhaps the usual number of collisions and derailments in 1916, there were not so many accidents that stood out in their frightful mortality as in other years.

The series of unfortunate accidents on the New York, New Haven, and Hartford continued and was marked by a rear-end collision of west-bound passenger trains two miles east of Milford, Conn., on the morning of February 22nd, about 11.21 o'clock. Six passengers and four trainmen were killed and some 276 employees and passengers were injured. A local passenger train No. 5 had left New Haven, about seven miles east of the point of collision, ran into express passenger No. 79, which had preceded it by two minutes and had been stopped by a defective air brake hose. The flagman, running back to signal No. 5, was run over by its engine, presumably while he was stooping to fasten a torpedo to the rail, while both engineer and fireman of the local were killed.

The engine of No. 5 and the rear car of No. 79, a new steel coach, were thrown to the left and into a freight train moving in the same direction on the adjacent track, and the wreckage of both passenger trains and of a part of the freight was scattered across the four main tracks. The boiler of the locomotive of No. 5 exploded and was thrown over the freight train to a point 50 feet out in a field. Eastbound passenger train No. 10, running at high speed, came on almost at the same moment that the collision occurred and was stopped but a short distance away from the obstruction on its track.

The most serious accident of the year occurred on the New York Central Lines West, near Amherst, Ohio, at about 3.18 A. M., on March 29th, in which two eastbound passenger trains met in a rear-end collision, and a westbound passenger train on the adjacent track ran into the wreckage. Twenty-seven persons were killed and 47 were injured. The two eastbound trains were the first and second sections of No. 86, the Chicago-Pittsburgh-Baltimore Limited, which left Toledo, 81 miles from the scene of the accident, at 1.43 A. M., and 1.56 A. M., respectively. Train No. 25, the Twentieth Century Limited, westbound, left Cleveland, 32 miles east of Amherst at 2.34 A. M. All of these trains were a little behind time, and were being run somewhat faster than the scheduled rate, but well within the speed limit of 70 miles per hour. There was a heavy fog at Amherst at the time of the accident, extending 15 or 20 miles west, but this did not interfere, however, with the operation of the first section of No. 86, whose engineer received a caution indication at the distant signal west of the Amherst interlocking plant. He came to a stop about 200 feet west of the home signal and then, starting to proceed, his train was struck at the rear by train second No. 86, whose engineer was certain he had received a signal for a clear track. The two rear cars of the first section, a coach and a club car were derailed and thrown across the westbound track, where they were run into in less than a minute later by the Twentieth Century Limited. The casualties chiefly were among the passengers riding in the coach and two men, a Pullman porter and a New York Central employee off duty, in the club car.

As this accident was in a way typical of what might readily occur at any time on a high-grade American railway, interest attaches to the following paragraphs from the report of the Interstate Commerce Commission on this accident, as a commentary on current practice:

"During foggy or stormy weather, when signal indications can be seen but a short distance, positive and definite instructions should be given prohibiting the running of trains at high speed. Accidents such as this may be expected to occur unless those in charge of the operation of this property at once take steps to see to it, by such check, observations, and other means as may be found necessary, that speed is materially reduced in foggy weather."

The extent of the hazard is then indicated as follows:

"This accident again directs attention to the fact that competent and experienced enginemen are not infallible, and that even a modern and complete block-signal system does not afford absolute protection against disastrous collisions.

... When trains are operated at high speed while the weather is so thick and foggy that signals can be seen a distance of only a few feet, no system of roadside signals can provide that measure of protection to which the traveling public is entitled. The number of serious collisions which have occurred within the past five years, due to enginemen failing to observe and obey roadside signal indications, demonstrates how imperative is the need of some device that will supplement the human element and assume control of the train in case the engineman fails properly to control his train."

Another serious rear-end collision of passenger trains occurred on the New York, New Haven, and Hartford. This was at Bradford, R. I., about 7.30 P. M., April 17th, and one passenger car, occupied by about 35 passengers, was crushed and immediately afterward took fire. Four passengers and one employee riding as a passenger were killed and about 30 passengers were injured. Two or more of the passengers lost their lives in the flames, which spread so rapidly that rescue was impossible.

Bradford, where this accident occurred, is on the main line, between Providence and New London, 23 miles east of New London. Local passenger train No. 633, behind time, was entering the side track at Bradford when it was run into at the rear by a following express passenger train, No. 25, which, notwithstanding the application of the emergency brake, struck the waiting train at a speed, said to have been, at the moment of collision, about 15 miles an hour. As train No. 633 consisted of three wooden cars, when the rear car was crushed, fire at once started in the wreck, and was rapidly spread by gas from a ruptured gas tank. The flames were soon beyond control, and all of the cars of train 633, together with the station buildings, were destroyed.

In 1916 the Pennsylvania Railroad system, which carried in its trains more people than in any previous year of its history, maintained its good record of not losing the life of a single passenger in a train accident of any kind.

During 1916 there were transported safely, on the lines east and west of Pittsburgh, 196,294,146 passengers, and at the same time the heaviest freight traffic ever handled by the Pennsylvania Railroad system was moved over its lines. The entire Pennsylvania Railroad system, taking into account every affiliated company either east or west of Pittsburgh, at the end of 1916 had to its credit three full calendar years in which no passenger had been killed as a result of a train accident on any portion of the lines. During this period 553,890,063 passengers—equal to 5½ times the population of the United States—were safely transported a total distance of approximately 15,000,000,000 miles. Upward of 9,000,000 trains, carrying both passengers and freight, were operated by day and night, over 12,000 miles of railroad line and 27,000 miles of track, while these passengers were being taken on their journeys without loss of life. On the lines of the Pennsylvania Railroad, east of Pittsburgh, no passenger's life was lost in a train accident during any of the preceding four calendar years, and in that period 616,626,957 people traveled safely over these lines alone.

**BLOCK SIGNALS.** While the block signal system, as may be seen from our annual rec-

ord, is not of itself able to prevent accidents, yet it does increase safety and accordingly it is of interest to learn that the mileage of railroads in the United States operated under the block system, on Dec. 31, 1916, was 99,885 miles, an increase of 2076 miles over the total reported at the end of 1915. In *automatic* mileage, which is the more significant figure in any consideration of increased safety at the end of 1915, the total was 32,978 miles for 1916, or 1818 miles above 1915. In manual signaling, the increases were largely offset by discontinuances, and corrections of errors and also by sections where the manual was superseded by the automatic.

The detailed comparison of the totals as compiled by the *Railway Age Gazette* for five years was as follows:

MILES OF ROAD IN THE UNITED STATES WORKED BY THE BLOCK SYSTEM

	—Automatic—		—Manual—		—Total—	
	In-crease over Jan. 1 prev. year	Jan. 1	In-crease over Jan. 1 prev. year	Jan. 1	In-crease over Jan. 1 prev. year	Jan. 1
1917	32,978	1,818	66,907	258	99,885	2,076
1916	31,160	1,471	66,649	8,206	97,809	9,677
1915	29,689	3,566	58,448	Decrease	88,132	943
1914	26,128	8,827	61,062	5,127	87,185	8,954
1913	22,296	1,961	55,935	Decrease	78,231	1,821

The Panama Railroad was operated throughout by the block system, nearly all automatic.

In Canada the block system was operated on 8526 miles of road, of which 617 miles were automatic, as shown in the following table:

LINES IN CANADA WORKED BY THE BLOCK SYSTEM

	Miles of Road		
	Automatic	Manual	Total
Canadian Government (Inter-colonial)	43	....	43
Canadian Government (Trans-continental)	..	6*	6
Canadian Pacific (Eastern)	222	4,535†	4,757
Canadian Pacific (Western)	36	18	54
Grand Trunk	5	3,850	3,855
Grand Trunk Pacific	4	....	4
Michigan Central	245	....	245
Toronto, Hamilton & Buffalo	62	....	62
	617	7,909	8,526

\* Electric train staff.

† Includes 113 miles electric train staff.

**GRADE CROSSING ACCIDENTS.** In 1916 serious accidents at grade crossings continued and there were many examples of gross carelessness on the part of motorists as well as inadequately protected crossings. These the railways were endeavoring to eliminate and coöperation with State or local authorities was being arranged to that end. But attempts were being made to improve conditions at once and the special committee on the prevention of accidents at grade crossing, of the American Railway Association, J. A. McCrea (Long Island), chairman, presented at the autumn meeting a report recounting its conferences with the committee of the National Association of Railroad Commissioners, and with representatives of the American Automobile Association. A committee of railroad lawyers was appointed to draft laws to be presented to different legislatures, and presented

three tentative drafts of bills. The first was substantially like that of the law in force in New Hampshire. It required cities and towns to maintain a cautionary signal at highway crossings, 300 feet or more from the tracks, with a penalty of \$1 a day for neglect. The committee recommended that the colors of such a sign should be white face with black letters, which was thought better, considering all hours of the day and night, than the white letters and blue background in use in New Hampshire. The second draft was similar to the first but included a section requiring the person controlling the movements of any self-propelled vehicle on passing the caution sign, to reduce speed to 10 miles an hour, with a penalty of \$10 for violation. The third draft went farther and required such vehicles to be brought to a full stop before crossing the tracks.

Several railroads had already carried out the recommendations previously published by the committees, and the railroad commission of California had made the caution approach sign, as recommended, the standard for the State of California. The committee urged all railroads to adopt at once the use of disks in place of flags at crossings, the painting of gates black and white, and the use of red lights at night.

These matters were further discussed by a committee of the National Association of Railroad Commissioners which reported, at the annual meeting of that body, the recommendations of a joint committee which included also the committee on the prevention of accidents at grade crossings. This report contained the following:

(1) That every grade crossing should be protected by an approach warning sign to be placed in the highway at a distance not less than 300 feet on each side of the railroad tracks, the sign to be a circular disk not less than 24 inches in diameter, painted white with a black border and black cross lines with the letters "R. R." in the upper quarters of the circle. Where it is deemed necessary this approach warning sign should be properly lighted at night.

(2) That the railroad companies maintain within the limits of their rights of way proper cautionary signs such as are now in use or authorized by law, and where deemed necessary this approach warning sign should be properly lighted at night.

(3) That all lights displayed at night towards the highway at grade crossings shall be red.

(4) That all crossing flagmen use during the day a uniform disk 16 inches in diameter, painted white with a black border, and the word, "Stop" painted thereon in black letters about five inches high, instead of the vari-colored flags, which are now in use.

(5) The uniform painting of all crossing gates with alternate diagonal stripes of black and white.

(6) That the railroad companies wherever practicable be required to maintain their property at grade crossings free of obstruction to vision, also that the highway approaches to crossings shall be so graded that the free passage of vehicles shall not be impeded.

(7) That the National Association of Railway Commissioners, the American Railway Association, and the American Automobile Association consider the advisability of agreeing upon what-

ever legislation may be necessary in the several States to make thoroughly effective the precaution of grade crossings; and that it is advisable that a uniform law requiring vehicles approaching such a crossing to reduce speed to a safe limit at the warning approach sign.

**GREAT BRITAIN.** In 1916 the railways of Great Britain, after the bad record of 1915, returned to their more normal and safe operation. Only four passengers were killed in train accidents during the year, a record distinctly comparable with that of 1901 and 1908, when none were killed, and in 1909 when one was killed. In this connection British railways pointed to this record with justifiable pride, as notwithstanding a curtailment of passenger and other trains, there was considerable extra traffic on the railways, and heavier duties and the longer hours, as a rule, were placed upon a much reduced staff, from which many of the best men had joined the colors.

One passenger, riding in a horse-car attached to an otherwise empty passenger train, was killed in a collision at Bletchley on August 11th, and one was killed in a collision at Warminster on September 2nd. A slight collision occurred at Lincoln on October 2nd, and a passenger, who did not complain at the time, died subsequently. The fourth fatality was suffered by a postal clerk who was killed in a serious collision at Wigan on December 19th. As regards the number killed in any accident the worst record of 1916 was at Kiltimagh on December 19th, when five ballastmen, riding in a car, were killed in a collision.

**ITALY.** In Italy in connection with the heavy and unusual traffic due to the war there was at first evidence of demoralization and from the end of 1915 through the first half of 1916, railway accidents were more frequent and serious than those in France and England combined. Exclusive of minor accidents involving merely damage to freight trains, but no unusual loss of life, there were three serious accidents during the nine-week period beginning December 27th and ending March 4th, resulting in fatalities to 52 persons and 169 being more or less injured. These and other accidents were explained on the general basis of lack of preparedness to adapt the various lines to military conditions and operations. For a long time Italian lines were quite unable to handle the immense freight and passenger traffic necessarily developed by the war.

In a serious accident that occurred at the end of the year 1915 near Bologna, a passenger train carrying both civilians and soldiers ran full speed into the rear of a freight train, with the result that the freight was derailed and 17 persons killed and 60 injured. This accident was due to fog, no signal lights on the freight train, and no warning to the engineer of the passenger train that a freight train was ahead. Then between Padua and the way station of Vigodarzere there occurred an accident in which two passenger trains collided, killing six passengers and injuring some dozen others.

The most serious of all the accidents took place February 26th, at 1.30 A. M., near the town of Cortona, to the south of Florence. A military troop train going at full speed was thrown down a 15-foot embankment, killing 19 soldiers and injuring 79 others. The loss of life and the great number of injured were largely due to the

use of wooden cars, several of which were at once broken and splintered.

On the night of March 4th, 13 miles from Ancona, on the Adriatic Sea, a military train, which had just left Caetellammare, collided with a fast train from Ancona, and 10 passengers were killed and 30 injured. It is but fair to state, however, that later in the year conditions improved and the Italian railway service was beginning to handle its troop trains as well as work its entire service with safety and dispatch.

**RAILWAYS.** On July 20, 1916, President Wilson signed a bill providing for a joint congressional committee to make a general investigation of railway transportation in the United States. The possible scope of the investigation was so broad as to include almost every conceivable aspect of the economics of railway operation and regulation, including government ownership. In May the Canadian government undertook the investigation of the whole Canadian railway situation, including the question of government ownership. The results of these two investigations may have a most important bearing on the future development of railway transportation in North America.

The Railway Executives' Advisory Committee, of which Frank Trumbull was chairman, was largely instrumental in getting the United States Congressional investigation started, and in the hearings which were begun November 23rd, before the joint committee of Congress, counsel for this committee set forth the legislative programme of railway executives. As briefly summarized by Mr. Trumbull in an address at Evansville, Ind., on December 15th, the programme advocated by the railways was as follows:

1. Exclusive Federal regulation, in behalf of all the States, so that regulation may be unified and symmetrical, and, therefore, more efficient.

2. Regional commissions, in order that regulation may be kept close to the people. This is further desirable because rate-making is largely done regionally, and commerce is not restricted to State lines.

3. Exclusive Federal supervision of future issuance of securities of railway companies. The railroads do not object to this supervision, but do object to its being done as at present by 19 or 20 different States, no two of which are alike in their methods.

4. In order that security issues may be intelligently supervised, Federal incorporation of interstate carriers would logically deserve consideration.

5. Division of functions of the Interstate Commerce Commission so that the same men will not be acting as prosecutors, judges, and jury.

6. Amelioration of the injustice to investors under which increases in rates can be suspended for 10 months instead of for, say, 60 days. This limitation on profits by the Federal and State governments differentiates railroad securities from other industries and necessarily puts a limitation on wage adjustments, which other industries do not feel.

7. Power in the Interstate Commerce Commission to prescribe minimum as well as maximum rates.

William J. Bryan and others appeared before the Congressional committee offering testimony

opposing an extension of Federal regulation to the curtailment of State regulation. Sovereign State rights and the paramount needs of local interests in railway service and rates, were the principal reasons given by Mr. Bryan. The hearings were being continued into 1917.

As administered up to and including 1916, railway regulation in America was not satisfactory to the railway managers, the general public, or to investors in railway securities. In 1916 the earnings of the railways were the largest in their history, nevertheless railway credit during the whole year was low compared to industrial credit. Railway facilities at the end of 1916 were obviously inadequate, but there was little new mileage of railways being built, and new equipment was being bought only because the need for it is so pressing as to be imperative.

The early part of 1915 was a period of very meagre railway earnings, only alleviated by drastic economies both in upkeep of the properties and in cost of handling the business offered. There was hardly any sign of the impending change until October, 1915. Then traffic came with a rush, and every single month from that time to the end of the year had been for that particular month in the year a record breaker in point of gross earnings. Until during the period under review, average gross earnings per mile for the railways as a whole in a single month of \$1150 were good, and there apparently was only one month, October, 1912, when average earnings per mile had exceeded \$1300.

Complete earnings figures for the calendar year 1916 as the YEAR BOOK went to press were available for only the nine months from January to September, inclusive. The largest earnings in the year are usually made in October and November, and this, when the complete figures are available, probably will be shown to have been true of 1916, but average total earnings per mile per month for the nine months, January to September, inclusive, were, for 1916, \$1279; and in three of these months, May, June, and July, more than \$1300 was earned, while in August and September all previous records were broken, with total earnings averaging \$1418 and \$1409 per mile.

**RAILWAY EARNINGS.** Nineteen hundred and sixteen was a record-breaker in the matter of railway earnings. Whether considered from the point of view of the fiscal year ended June 30th, or of the calendar year, both the gross and the net revenues of the steam railways of the United States were the largest in their history. For the fiscal year 1916 the gross revenues of steam roads having annual operating revenues above \$1,000,000 amounted to \$3,396,808,234. This was greater by half a billion dollars, or \$508,000,000, than their revenues during the lean year of 1915. Compared with 1913, the last record or peak, the revenues of 1916 showed an increase of more than a quarter billion dollars, or \$261,000,000. Similarly, the net revenues of the million-dollar railways in 1916 were the greatest in history, amounting to \$1,176,804,001. This was an increase of nearly a third of a billion, or \$319,000,000 over 1915, and an increase of \$233,000,000 over the previous record year of 1913. The million-dollar roads operate over 90 per cent of the total railway mileage, and earn over 95 per cent of the

total railway revenues; their returns are therefore fully representative of railway operations as a whole.

**OPERATING EXPENSES** in 1916 were also on the increase. They amounted to \$2,220,004,233, which represented the greatest annual expenditures in the history of American railways, although only slightly greater than their expenses in 1914, which was the next largest year in the matter of expenses. The increase over 1915 was \$189,000,000. That the railways were able in 1916 to keep their expenditures down to within \$1,000,000 of those for 1914, although they were doing considerably more business, speaks well for the economy and efficiency with which the railway managers were handling their properties in 1916. In fact, when reduced to a per mile basis, the operating expenses in 1916 were actually less than in 1914. A large part of the economy, however, was exercised in the maintenance of way account. Maintenance of way expenses in 1916 were cut by \$14,000,000, traffic and transportation expenses by \$9,000,000, and general expenses by \$4,000,000. There was an increase of \$26,000,000 in maintenance of equipment.

While the business done by the railways in 1916, as measured in ton-miles and passenger-miles, was greater than ever before, the increase was most marked in the matter of freight. Ton-miles increased about 25 per cent over 1915, and passenger-miles about 6 per cent; freight traffic was appreciably greater in 1916 than in 1913, while passenger traffic was about the same as in the heavy years of 1913 and 1914.

**FREIGHT CONGESTION.** On the lines terminating at New York and on the New England lines, the congestion of freight traffic became serious. Through selfishness or panic, many manufacturers ordered more fuel and raw materials than they had storage room for and held the railway cars for long periods. Lack of ships at New York was an important factor in the congestion, but New England lines were more congested even than the Eastern trunk lines. At one time there were 57,000 freight cars on the New York, New Haven, and Hartford Railway and its subsidiary, the Central New England. This was at least 12,000 cars more than could be handled satisfactorily. Embargoes were placed against freight entering New England, but these embargoes were not in time to prevent severe congestion.

There was shortage of freight cars at first in the West and in the later months of the year over the entire country. The restricted purchases of cars and locomotives in 1914 and 1915 was also a factor in the situation. There was also a large amount of delayed maintenance work to be done both in repairs to equipment and renewal of rails, ties, bridges, etc. This meant that the railways had to come into the market for new equipment, steel, and other materials and for labor at a time when the prices of materials and labor were mounting rapidly.

**RAILWAY EQUIPMENT.** In the 12 months of 1916 the railways, private car lines, and other users of cars and locomotives in the United States and Canada placed orders for 2891 locomotives, 165,324 freight cars, and 2540 passenger cars. (Figures compiled by the *Railway Age Gazette*.) In the same period orders were received from foreign countries by builders in

the United States and Canada for 2983 locomotives and 34,214 freight cars, making totals respectively of 4974 locomotives and 199,538 cars. In view of the exceptionally high prices at which all this equipment was sold this means that 1916 was undoubtedly the busiest year in the history of the car and locomotive business. Consider domestic orders alone: about 2900 locomotives at \$30,000 each which, if anything, is rather low, \$87,000,000; about 165,000 freight cars at \$1500 each, \$247,500,000, and 2500 passenger cars at \$18,000 each, \$45,000,000, making a very conservative figure of \$379,500,000. It is not so easy to estimate the total for foreign orders, but the value was at least \$170,500,000, making a total for both foreign and domestic car and locomotive business of \$550,000,000, or well over \$10,000,000 a week. The prices of freight and passenger cars actually advanced from 75 to 80 per cent over what they were a year previously; they were almost three times what they were two years before at the end of the year.

**NEW RAILWAY MILEAGE.** During 1916, 1,098.41 miles of new lines were built in the United States. New second track amounted to 312.31 miles, with additional third, fourth, and other main tracks to the extent of 31.06 miles. While the total mileage of new lines was considerably more than that of 1915, it was still less than for any other year since 1864. In Canada the mileage of new lines built was 290.04 with 7.09 miles of additional second track. This compares with 718 for 1915 and a maximum of 3013 which was reached in 1913.

An addition of 50 miles of completed line was reported for the government railway of the United States in Alaska (q.v.), which, with the total of 34 miles reported last year, gives a total completed length of this road of 84 miles.

\* For years prior to 1911 the figures for persons killed and injured are restricted to passengers and to employees on duty. Returns for electric railroads are included in the same years.

As might be expected, the largest mileage of new lines built in 1916 was in the Western and Southern States, for it was in these sections that there was the greatest need for additional railways. There were still considerable areas in these parts of the country without adequate mileage, and their development would be possible only as business conditions justify the roads in committing themselves to such work. The fact that no new mileage was reported as

having been built in 1916 in 14 States is not necessarily an indication that they now have adequate transportation facilities, but is in many cases a reflection of the recent uncertainty which had attended railway investment.

The cessation of railway construction work was particularly marked during 1916 and the years immediately before in those Middle Western States which had been most active in the passage of two-cent fare laws and other legis-

lation tending to restrict railway earnings or to increase their costs of operation. It was significant that no new lines had been built in Iowa, Missouri, Nebraska, and South Dakota in 1916, while in Oklahoma and Texas only 23 and 11 miles respectively had been built.

ered, making a total of 95,000 miles out of the 260,000 miles of railway in the United States. The director of the department of valuation estimates that at the same rate of progress the field work on all lines would be completed by Jan. 1, 1920. This field work formed the basis

The mileage of second and other multiple main tracks completed was considerably less than that of 1915. At first glance this seemed to be inconsistent with existing conditions, for the railways were handling the heaviest business in their history, and in many instances were suffering from a lack of facilities. It should be remembered, however, that the increase in business was so recent that the managements had not had time since it had come to build additional main tracks. Among the projects which had been held up for some time, but which were being carried to completion, were the construction of the last gaps in the second tracks of the Erie and the Baltimore and Ohio, between Chicago and the Atlantic seaboard.

**VALUATION OF EXISTING RAILWAYS.** The Interstate Commerce Commission department of valuation continued during the year its vast work of making a physical valuation of the railways of the United States. This work was begun in 1914 and on Jan. 1, 1916, about 45,000 miles of line had been covered by the roadway and track parties. By the end of December about 50,000 miles additional had been cov-

ered, making a total of 95,000 miles out of the 260,000 miles of railway in the United States. The director of the department of valuation estimates that at the same rate of progress the field work on all lines would be completed by Jan. 1, 1920. This field work formed the basis of the so-called tentative valuations. Apparently under the law the valuation should be based on (1) the estimated cost of reproduction new—that is the cost at the time of building a new railroad exactly like the one in existence; (2) the cost of reproduction new less depreciation; and (3) a record of the amount that it actually cost to build the railway. In the tentative valuations only the first two bases were used because of the difficulty of obtaining the data for the third basis. Late in 1916 the first of the tentative valuations were served on the Atlanta, Birmingham, and Atlantic, the Texas Midland, the New Orleans, Texas, and Mexico, and the Kansas City Southern, while others were understood to be practically completed on the properties of the Elgin, Joliet, and Eastern, the Los Angeles and Salt Lake, and one or two other lines. The appearance of these reports gave the railways their first opportunity to ascertain the attitude which the government would take on many of the important questions. When the work was first undertaken they organized in order to extend the fullest coöperation to the Federal employees with the expectation that the aim of the government

would be to ascertain the fair value of the property. With the appearance of these reports there was marked disappointment on the part of the railway men, for they felt that the department of valuation was endeavoring to establish the lowest possible valuations and to force the roads to fight before the Interstate Commerce Commission or in the courts to establish the real value of their properties.

**RAILROAD RECEIVERSHIPS.** Two important roads were taken out of the hands of receivers in 1916 and two important roads went into receivership. Singular as it may appear at first glance, neither the character of the reorganizations under which the St. Louis and San Francisco and the Western Pacific were taken out of the hands of receivers, nor the causes which led to the receiverships of the Boston and Maine and the Texas and Pacific reflected conditions of railroad earnings or of railroad credit in the calendar year 1916. More significant really was the comparatively large number of small roads sold under foreclosure. The number of these sales showed that the security holders and creditors of these roads were willing to accept conditions as they found them without hope of material improvement in the near future. The plan under which the St. Louis and San Francisco was reorganized was dated Nov. 1, 1915, and the fact that it was not actually put into effect and the road taken over by the new company until the latter part of 1916 was because of technical opposition on the part of the Missouri railroad commission. The plan, therefore, was the expression of opinion of the bankers and large holders of securities as to what future conditions would be based on their outlook of 1915 and not on the outlook of 1916. The St. Louis and San Francisco, by the successful application of sound principles of railroading, had already laid the basis for a sound reorganization of its finances before the wave of industrial activity and large railroad earnings came. The Western Pacific's reorganization plan was dated Dec. 15, 1915, and represented a drastic sacrifice on the part of security holders recognizing that it would take considerable time to build up substantial net earnings and that in the meantime fixed charges must be very low. The fixed charges are at the rate of \$1000 per mile for the new company. The receivership of the Boston and Maine was due to the inability to harmonize conflicting interests of security holders of the parent company and leased line companies, and conflicting State regulation in regard to a general plan for a sound reorganization of the property without receivership. The Texas and Pacific receivership was also due to the failure of conflicting interests identified with the financing of the property to get together. It was thought that the success of the reorganization plans which had not gone as far as foreclosure sales would reflect more truly the state of railroad credit in 1916 than did the receiverships and foreclosures taking place in that year. The total mileage of roads put in the hands of receivers during 1916 was 4439 and at the end of the year there were 34,559 miles of railway in receivers' hands. The total mileage of railways sold under foreclosure in 1916 was 8355.

**INCREASED DIVIDENDS.** It has been the practice in the management of many railroads in the United States to cut dividends in hard

times and to restore them, or increase them, or pay an extra dividend in years of exceptional prosperity. The alternative to this would be to set up a specific "dividend fund" to which especially large appropriations could be made in prosperous years and on which the management could draw in hard times. The second method may be preferable, but the first is the one which has appealed to American financiers and investors. The speculative element in it is an attraction. It is to be expected, therefore, that so long as present methods prevail in a year of greatly increased gross and net earnings the dividend changes that will occur will be changes to a higher rate or extra dividends. If dividends are to be reduced in bad years, and at the same time railroad credit is to be maintained, and any future financing is to be done by the sale of stock, roads which are ably and conservatively managed, like the Louisville and Nashville, the Buffalo, Rochester, and Pittsburgh, the Norfolk and Western, the Chicago, Milwaukee, and St. Paul, and the Union Pacific must be expected to distribute to the owners some share of the increase in profits in an unusually prosperous year.

All of these roads did raise dividends, but as a matter of fact, only in the case of the Union Pacific and Norfolk and Western was there an extra distribution made representing extraordinarily large net earnings. The Louisville and Nashville, St. Paul, etc., simply resumed in 1916 rates of dividend which they had to cut in the hard times of 1914 and 1915. In almost every case of dividend changes on the larger roads the increases for 1916 were sound and conservative. The only one that compared in the slightest degree with the extraordinary profits being reaped by industrial and manufacturing companies was the Pittsburgh and Lake Erie's extra dividend of 20 per cent.

The more important dividend changes in the *rate declared* in 1916 as compared with 1915, were as follows: Atlantic Coast Line 5 to 7; Buffalo, Rochester, and Pittsburgh, 4 to 6; Chesapeake and Ohio, nothing to 4; Chicago and Milwaukee, 5 to 4; Cleveland, Cincinnati, Chicago, and St. Louis, nothing to 5; Illinois Central, 5 to 6; Louisville and Nashville, 5 to 7; Nashville, Chattanooga, and St. Louis, 5 to 7; Norfolk and Western, 6 to 7, and an extra dividend of 1 per cent; Pittsburgh and Lake Erie, an extra dividend of 20 per cent; Union Pacific, an extra dividend of 2 per cent.

**ADAMSON LAW.** On Saturday, September 2nd, both Houses of Congress passed a bill, which had been drawn up by Roger Adamson, which provided for an 8-hour basis of pay for railroad trainmen engaged in interstate commerce. On Sunday the President signed the bill, and signed it again on Monday so as to make sure of the signature being legal. This bill, which became a law with the President's signature, provided "that beginning Jan. 1, 1917, 8 hours shall, in contracts for labor and service, be deemed a day's work and the measure or standard of a day's work for the purpose of reckoning the compensation for services of all employees who are now or may hereafter be employed by any common carrier, by a railroad, except railroads independently owned and operated not exceeding 100 miles in length, electric street railroads and electric interurban railroads . . ."

Railway engineers, firemen, conductors, and

trainmen had been paid on a day basis. A day's work consisted either of 100 miles' run or 10 hours' work. Thus, the trainmen of a passenger train which ran 100 miles in two hours and a half were paid for a full day's work and were paid overtime for any additional distance they might run. On the other hand, the crew of a local freight train, which made only 85 miles in 10 hours were paid for a day's work on the basis of the 10 hours worked.

The Adamson law was passed by Congress at the request or insistence of President Wilson to avert a strike of the four great brotherhoods of railroad trainmen—the Brotherhood of Locomotive Engineers, the Order of Railway Conductors, the Brotherhood of Locomotive Firemen and Enginemen, and the Brotherhood of Railroad Trainmen. The strike was called for September 4th because the railroad managers had refused to change the contracts with the train employees so as to read 8 hours instead of 10 hours. The brotherhoods had refused absolutely to let this question go to arbitration. When the Adamson law was passed the brotherhood chiefs called off the strike, believing that the law gave them what they had demanded from the railroad managers, namely, that they should be paid for a day's work either when they had run 100 miles or had worked 8 hours, and should be paid overtime for any mileage over 100 miles or any time over 8 hours.

As a matter of fact, a law which would have provided specifically that 8 instead of 10 hours should be substituted in all existing contracts specifying hours as a basis of pay would, it was thought by many lawyers and legislators, have been unconstitutional. The law that was passed was so general in its terms that neither railroad employees nor railroad managers were able to agree on its meaning. The railroad managers insisted that the law provided for an 8-hour basic day and that therefore the mileage basis must be abandoned. This would mean that all men in passenger service would have to work from two to four times as long as they do now to earn a day's pay, and it would increase the number of hours which trainmen in fast freight service would have to work to earn a day's pay. It would increase the wages—not shorten the hours—of men in slow freight service, because they would begin to get paid overtime at the expiration of 8 hours instead of 10 hours; but with divisional terminals 100 miles apart or thereabouts as they are now, the length of run would have to be the same and therefore the number of hours worked, 10, 11, or whatever it might be, would be the same. The trainmen, of course, insisted that the mileage basis should be retained and the contracts simply changed by the substitution of 8 for 10 in specifying the number of hours.

The law was not expected to be put into effect on January 1st pending a test of its constitutionality in the United States Supreme Court. See ARBITRATION AND CONCILIATION, INDUSTRIAL.

**POMERENE BILL.** On August 29th the so-called Pomerene bill was signed by the President and became a law. This law embodied a carefully prepared codification of all the existing Federal laws on the subject of bills of lading and puts in statute form numerous common law principles; but most important of all it made the railroad company responsible for the acts of agents in signing bills of lading. Heretofore if the agent

signed a bill of lading for goods which were never delivered to the railroad the railroad company was not responsible for this unauthorized act of its agent. The discussion of this subject between bankers and railroad men had gone on for years. The movement of the cotton crop of the United States is largely financed on the basis of bills of lading issued by the railroad company for the bales of cotton received from the planters. Money is advanced by the local banks to the planter on the security of the bill of lading for the cotton which the planter has delivered to the railroad. The local banks send these bills of lading to the New York banks, and where the cotton is for shipment abroad, the bills of lading may be used as the basis of loans between foreign bankers and New York bankers. Heretofore if through fraud or for any other reason the bill of lading had been issued against cotton which had not been delivered to the railroad, the railroad could not be held responsible, the theory being that the company was not responsible for an unauthorized act of its agent, the agent being authorized to sign a bill of lading only upon receipt of the goods covered thereby.

There was one other piece of legislation which should be mentioned. The law which had provided that the actual value of baggage must be declared at the time of checking, and making the railroad company responsible for the full value, if it were lost or damaged, and also making the traveler liable to fine or imprisonment if he declared a false value, was repealed and railroad companies are now liable only to the amount of \$100 or \$200, as the case may be, as provided for in the baggage check.

**THE CANADIAN SITUATION.** The peculiar railway situation in Canada at the end of 1916 was comprehensively summed up in the *Railway Age Gazette* (New York):

"The Canadian House of Commons passed on the same day a bill which provides for lending the Canadian Northern \$15,000,000 to tide it over for a year and a bill appropriating \$150,000 for the expenses of a commission to make a thorough investigation of the whole railroad situation. Canada is face to face with a crisis in her relations with the Canadian Northern and the Grand Trunk Pacific. There are three alternatives which are being seriously discussed: The government can continue to lend money to these railroads until such time as they can begin to earn their fixed charges; or the government can refuse to continue lending money, with the result that default will occur and receivership for both the Canadian Northern and Grand Trunk Pacific apparently inevitably take place; or, lastly, the government can take over the two roads and add the 3550 miles of the Grand Trunk Pacific (including the National Transcontinental) and the 4966 miles of the Canadian Northern to the 1889 miles of railroad now operated by the Canadian government.

"All of the stock of the Grand Trunk Pacific is held by the Grand Trunk. Part—about 75 per cent—of the cost of building the Western division of the Grand Trunk Pacific was raised by the issue of bonds bearing the guarantee of the Dominion government and the remainder by bonds guaranteed by the Grand Trunk, and by bonds guaranteed by one or other of the provinces. The government itself built the Eastern division of the Grand Trunk Pacific (National

Transcontinental) and the portion of this which is now being operated, is being operated by the Intercolonial. The Canadian Northern stock is owned 40 per cent by the Canadian government and 60 per cent by Mackenzie, Mann & Co. The Canadian government guarantees \$45,000,000 of the company's debenture bonds and has made both cash and land grant subsidies to it. Some of the provinces have guaranteed certain issues of bonds.

"The securities of both the Grand Trunk Pacific and the Canadian Northern are very largely held in England. The Grand Trunk would probably be glad rather than sorry to give gratis its stock of the Grand Trunk Pacific to the government if it were thereby relieved of its guarantee of Grand Trunk Pacific bonds. For the government to get hold of the 60 per cent of the Canadian Northern stock held by Mackenzie, Mann & Co., however, would be a very different undertaking. It is hardly conceivable that Sir William Mackenzie would relinquish control of this stock without a bitter fight, and he has the reputation of being a very good fighter.

"Most thoughtful and patriotic Canadians agree that default on either Grand Trunk Pacific or Canadian Northern bonds, with resulting receivership, would be a blow to Canada's credit which should not be even considered. In the debates which took place in the House of Commons there were members who urged that if one-seventh of the railroad mileage of the United States was in the hands of receivers it would be no unbearable calamity if the two Canadian roads which could not earn their fixed charges went into receivers' hands. But this urging was half-hearted and, when it came to a vote, they followed the lead of those who held that receivership must be averted at any cost."

**RAILWAYS, ELEVATED.** See RAPID TRANSIT.

**RAINFALL.** See METEOROLOGY.

**RAMSAY, SIR WILLIAM.** A British chemist, died at Hazlemere, Buckinghamshire, July 23, 1916. He was born in Glasgow Oct. 2, 1852, the son of a civil engineer. After graduating from Glasgow University, he studied at Tübingen, returning to his alma mater in 1874 as a tutor. From 1880 to 1887 he served as professor of chemistry at University College, Bristol, of which institution he was also principal for six years; but his main work was done at University College, London, where he held a chair till his retirement in 1913. Professor Ramsay was best known for his success in transmutation of metals. In 1907 he announced that through the use of radium he had produced a copper compound from sodium, lithium, and potassium. With Lord Rayleigh, he discovered argon, a new constituent of the atmosphere. For their achievement the two scientists were awarded the 1904 Nobel prize in physics. Other of Professor Ramsay's discoveries included the atmospheric gases neon, krypton, and xenon, and helium, a constituent of certain minerals. His writings, concerned with his researches, were published as papers in learned journals. The value of his work was recognized by his election to honorary membership in many of the great royal academies of Europe, and to other learned societies, by various foreign orders, including

the Legion of Honor (officer), by honorary degrees, and by knighthood (K.C.B., 1902). He lectured in the United States at Johns Hopkins University and before Lowell Institute, Boston, and in Italy before the Chemical Institute of Rome, when King Victor Emmanuel heard him discuss the subject of transmutation. Professor Ramsay was doubtful whether his discoveries would lead to the conversion into gold of one of the baser metals, the great aim of the alchemists, and he stated that the cost would be prohibitive; but he opened up a new field of research in his science.

**RAMSEY, JOSEPH.** An American railroad builder and official, died at East Orange, N. J., July 7, 1916. Born at Pittsburgh, Pa., and educated at the Western University of Pennsylvania (now University of Pittsburgh), he identified himself early with the construction of railroads, making a reputation in 1873-79 as chief engineer and superintendent of the Beh's Gap Railroad in Pennsylvania. This road, in eight miles, climbs 1200 feet, makes curves of 28 degrees, and has a large amount of trestle work. Afterward, till 1890, he was connected with various railways as engineer, and in the year named became assistant to the president of the Cleveland, Cincinnati, Chicago, and St. Louis. Thereafter his duties were largely executive, as president of the Peoria and Pekin Union Railway, vice-president of the Cincinnati, Wabash, and Michigan, general manager of the C. C. C. and St. L., etc. In later life he was mainly identified with the Wabash, as vice-president and general manager (1891-1901) and as president (1901-05). During that period and afterward, however, he was at the head of other roads of less importance, at the time of his death being president of the Lorain, Ashland, and Southern.

**RANGER, HENRY WARD.** An American landscape painter, died in New York City Nov. 7, 1916. He was born at Syracuse, N. Y., in January, 1858, and was educated at Syracuse University. He studied art independently, and by travels in France, England, and Holland assimilated various styles of landscape painting. His work, at first often lacking in truth to nature, improved steadily in technical skill, breadth, and feeling until finally he became known as the dean of American landscape painters and as a leader of the Tonal School. His favorite subjects were the hillsides and woods of New England. His best known paintings are "Spring Woods" and "High Bridge" in the Metropolitan Museum, New York; "Sheep Pasture," Pennsylvania Academy; "Top of the Hill," Corcoran Gallery, Washington; "Bradbury's Mill Pond, No. 2," and three other landscapes in the National Gallery, Washington. Several of his landscapes are to be found in European galleries. He received gold medals at Charleston in 1902, at Philadelphia in 1907, and in 1906 was elected National Academician.

**RANKIN, JEANNETTE.** The first woman member of Congress, was elected in November, 1916, representative at large on the Republican ticket for Montana to the 65th Congress. She was born in 1882 on a ranch near Missoula, Mont., graduated at the University of Montana, studied singing in Seattle, and afterward took a course in the School of Philanthropy in New York City. She early became interested in the woman suffrage movement and in prohibition and is an effective campaign speaker. After

leaving the School of Philanthropy, she went to the Pacific coast and prepared herself for systematic work in the woman suffrage cause, studying in the University of Washington at Seattle. She toured that State, speaking in the mining and lumber camps, and appearing also before the Legislature when the suffrage amendment was submitted to the State. She was elected president of the suffrage organization in Montana. She is deeply interested in social welfare work and the care of children. Her election was in part attributed to the woman suffrage vote.

**RANOUS, DOBA KNOWLTON.** An American editor and author, died in New York City Jan. 19, 1916. She was born in Ashfield, Mass., in 1859, her maiden name being Thompson, and at 20 joined the famous Daly's Theatre company in New York. Two years later she was married to William V. Ranous, and retired from the stage. After her husband's death, she turned to editorial work for a firm that published text-books, and later edited, and in large part translated, sets of books issued in sumptuous editions. These included the works of Maupassant, Daudet, Flaubert, and Disraeli. In collaboration with Rossiter Johnson she edited *The Literature of Italy* (16 vols., 1906), herself translating several volumes. Mrs. Ranous's work as a translator showed not only understanding of the original, but ability to render it into idiomatic and graceful English. She served on the staffs of the *Century Magazine* and the *Century Dictionary*, published anonymously *The Diary of a Daly Débutante* (1910), and had read the proofs of *Good English in Good Form* (1916), before her death.

**RANUZZI DE BIANCHI, VITTORIO AMEDEO, CARDINAL.** See ROMAN CATHOLIC CHURCH.

**RAPID TRANSIT.** NEW YORK. On Dec. 31, 1916, construction contracts, under the Dual System plans, had been awarded for 81 out of the 87 sections into which the work was divided, and including lines which lie in four of the five boroughs of the city. Progress had been made so that several new lines probably could be opened in 1917, including the Lexington Avenue and the Seventh Avenue lines. Contracts to be let included two sections of the Nassau Street link, connecting the Chambers Street terminal of the Brooklyn Rapid Transit system with the Whitehall Street tunnel, and the section of the Steinway tube at 42nd Street, from Park to Seventh avenues.

The diagonal station at 42nd Street and Park Avenue where the Lexington line joins the older subway was well enough along to warrant the hope that the line on Lexington Avenue might be open for operation in the autumn of 1917 and it was hoped that by that time the lines on Jerome Avenue and White Plains Road could be opened. On the Seventh Avenue line many of the sections were finished.

The Astoria extension in Queens, connecting with the Steinway tunnel and the Second Avenue elevated line, was nearing completion. The Broadway subway in Manhattan, much of which was finished, might be opened between the Battery and 14th Street in 1917, but it was thought more probable that the partial service would extend south only to Canal Street, where there was to be a crosstown connection with the bridges. The new Jamaica Avenue elevated extension of the Broadway line from Crescent Street, Cypress Hills, Long Island, was so far

advanced that within a few months it could be operated as far as Walnut Street. The New Utrecht Avenue line was put in operation in the summer of 1916 for practically its whole length, and was to be connected to the new terminal at Coney Island before the rush of summer traffic began.

The total estimated cost of construction of city owned lines included in the Public Service Commission's plans was approximately \$252,000,000. Of this sum the city was to provide about \$180,000,000, the Interborough Rapid Transit Company \$58,000,000, and the New York Municipal Railway Corporation (Brooklyn Rapid Transit Company) \$14,000,000. The total amount of work on the new lines completed, under construction, and under contract on Dec. 31, 1916, aggregated \$196,279,000, while in addition, about \$15,000,000 had been spent for real estate, and the two corporations that were to operate the system had expended or let contracts for about \$35,000,000 worth of work in connection with the lines which they own, besides about \$20,000,000 for equipment.

One event of the year was the resignation of the chief engineer of the Public Service Commission in charge of the subway construction, Alfred Craven, who had been connected with the work since 1900. Mr. Craven was retained, however, as consulting engineer and D. L. Turner, formerly deputy engineer of subway construction, was made acting chief engineer.

**BOSTON'S SUBWAY EXTENDED.** Direct rapid transit from the South Union Station, Boston, to Harvard Square, Cambridge, Mass., was made possible towards the end of the year by the equipment and operation by the Boston Elevated Railway Company of the portion of the Dorchester tunnel in Summer Street between the South Station and Washington Street. The Dorchester tunnel, which is an extension or continuation of the Cambridge subway, begins at "Park Street Under" station beneath Boston Common and continues easterly under Winter Street and Summer Street to and through Dewey Square, where a notable station known as "South Station Under" was built, capable of accommodating the large crowds that inevitably would concentrate at this terminal, requiring unusual equipment in the way of entrance and exit openings and escalators. From Dewey Square the Dorchester tunnel turns in a southerly direction, running through a part of South Boston to Andrew Square. This tunnel, from the Cambridge subway at Tremont Street to and including the Washington Station near Washington Street, was opened to travel on April 4, 1915. The part recently put in service in 1916 adjoins this section and extends to the new station in Dewey Square.

**CHICAGO'S RAPID TRANSIT SCHEME.** The commission consisting of William Barclay Parsons, Robert Ridgway, and Bion J. Arnold, appointed to consider and recommend a plan for rapid transit for the city of Chicago, submitted its report to the city council on Dec. 21, 1916. The commission has laid out a nine-year programme calling for an expenditure of \$100,000,000 for construction and equipment. The proposed plan involves the construction of a double-track rapid transit subway six miles in length and a five-mile subway for street surface cars, to relieve congestion in the business district. The first named subway would be built

in State Street from 18th Street to Chicago Avenue and would connect with the Northwestern and South Side elevated lines. The subway for surface cars would be a loop under Jackson and Washington streets and Michigan Boulevard. These two subways only represented a beginning and would be extended. Extensions to the elevated railway lines of the city would be made, aggregating 65 miles of single track. The elevated lines would be converted into structures capable of furnishing high speed express service in place of the local service they were accommodating. The network of street railways would be increased by 150 miles of new line, and 111 miles of old lines would be reconstructed. Eventually, the rapid transit subway would have a total trackage of 58 miles.

The commission recommends that a single corporation be organized under municipal control to operate all the passenger transportation of the city—surface, elevated, and subway—and give universal transfers. The present elevated railway system would be extended by the construction of additional lines, and the building of new lines so as to give three through north-and-south routes, located on Market and 5th streets and Wabash Avenue. There would be one four-track line through the business district and two double-track lines in the western part of the city. On the elevated loop the grades would be separated at the intersection of the east-and-west and north-and-south lines to increase the safety of operation and avoid delays. The present elevated loop would be extended so as to cover the entire central business district.

Other subways were to be built for the two east-and-west elevated lines, with a connecting terminal loop and were to be at a different level from the north-and-south subways.

At a later date an extension was to be added to form an independent north-and-south subway line from 63rd Street to Belmont Avenue.

The ultimate plan involves the expenditure of \$260,000,000 and provides for 58.1 miles of subway of which 53 miles would be for rapid transit. This amount would be distributed over some 40 or 50 years and from the profits the invested capital of the corporation would be paid back.

Under the financial plan proposed by the commission it was hoped that by 1937 there would be amortized actually or in effect nearly \$120,000,000, or 30 per cent of the then total capital investment. The continuation of this forecast indicated that by about 1947 not only would all of the additional capital to be furnished by the corporation be paid off, but the operation of the amortization fund and the city's traction fund would probably begin to reduce the original 1916 valuation of the combined properties. Possibly by the year 1960 the whole of the corporation's then investment would be retired and Chicago would then become the actual owner in fee of a combined system of subway, surface, and elevated railroads, to lease or operate as it pleased, which would be maintained at full efficiency and have cost at least \$490,000,000.

**SEATLESS CARS.** In some of the London rapid transit lines during the periods of congested traffic it was found impossible to increase either the number of trains or the length of trains and station platforms. The cars operated by the District Railway accommodated 48 passengers seated with almost as many more standing, to

the discomfort of themselves and those sitting. Accordingly it was proposed during the year to remove all seats, supply posts and rails and straps and increase the number of doors. In this way it was believed that for short runs the number of passengers could be nearly doubled without any greater discomfort.

**RASMUSSEN, KNUD.** See POLAR RESEARCH, Arctic.

**RASPUTIN, GREGORY.** A Russian monk, murdered in Petrograd on the night of Dec. 31, 1916. He was born about 1873 in Siberia and in 1905 first became known in Petrograd while promoting the revival of the cult of an ascetic sect of flagellators. At one of the meetings in behalf of this revival, which was under the patronage of members of the nobility, he attracted the attention of Emperor Nicholas II and soon became a visitor at his palace at Tsarskoe-Selo. He is said to have interested the Emperor both by his mysticism and by his practical aid in making the Russian peasant turn from vodka to work and domestic duties. Reports of his political intrigues and of a private life inconsistent with the monkish profession soon made him an object of dislike and suspicion among the Russian upper classes and also among those who were struggling in behalf of constitutional government. Plots were made to assassinate him and in July, 1914, he was stabbed by a woman at Tyumen, Siberia, and his recovery was due to the skill of the court physician sent by the Empress. After the outbreak of the European war his name became widely known as a trusted adviser of the Emperor, and he was believed to have a dominating influence at court. About 1906 he had become an associate of one Manasevick-Manuilov and befriended the latter in his intrigues. When, chiefly through Rasputin's influence, the reactionary Stürmer became premier, Manuilov became his private secretary and acted as an intermediary between Stürmer and Rasputin. The two came to be considered as "dark forces," pro-German in sympathy, hindering popular efforts in the war against the Central Powers, and cooperating to frustrate all attempts toward constitutional government. The arrest of Manuilov for bribery was to be followed by a trial on Dec. 28, 1916, in which sensational disclosures were expected, among others certain negotiations between Stürmer and the German government. The trial, when about to begin, was suddenly stopped by an order from the Emperor. This was believed to be due wholly to Rasputin's influence. He was enticed to a house by certain influential persons and was murdered, his body being thrown into the River Neva, where it was found next day.

**RAT-BITE FEVER.** This disease has long been recognized in Japan as a definite pathological entity. Investigators attached to the Imperial Japanese Institute for Infectious Diseases have identified a spirochete as the probable cause of this disease. The spirochete was isolated from the blood of two well-defined cases. The organism is described as larger than the *Spirochaeta pallida*, but smaller than the *Spirochaeta* of Dutton and Obermeyer. One of the patients recovered under treatment with mercury, the other under salvarsan. Rat-bite fever resembles in its characteristics the disease due to the spirochetes mentioned and like them responds to mercury and salvarsan.

F. G. Blake, of the Peter Bent Brigham Hospital in Boston, has described a fatal case of rat-bite fever from the blood of which during life he isolated a streptothrix in pure culture which was apparently identical with the *Streptothrix muris rattii* described by Schottmüller in 1914. Blake not only isolated the organism, but observed the development of a powerful agglutinin in the patient's serum for the streptothrix, and necropsy revealed an ulcerative endocarditis, produced by a streptothrix. The streptothrix is described as a branching filamentous organism, varying in length and having a tendency to break up into forms resembling bacilli and cocci. The filaments themselves may be either straight or curved, and take up readily the ordinary bacterial stains.

Wilder Tileston of New Haven also reported two cases in 1916, one a typical the other an abortive case, both of which recovered under salvarsan, and showed the presence of streptothrix in the blood.

**RATES, RAILWAY.** See RAILWAYS.

**RAYMOND, BRADFORD PAUL.** An American educator, died at Middletown, Conn., Feb. 27, 1916. Born at Stamford, Conn., in 1846, and educated at Hamline University, Lawrence University (A.B., 1870), and Boston University (B.D., 1873), he held Methodist charges in New

England for a decade, also studying for a year in Germany during this period. In 1883 he became president of Lawrence University, and in 1889 president of Wesleyan University, at Middletown, Conn. This latter office he held till 1908, subsequently serving as professor of ethics and biblical literature. Northwestern and Yale gave him the honorary degree of D.D. and Lawrence that of LL.D. While he was a student at Hamline University the institution would have had to close before the end of the year because of financial troubles had Dr. Raymond not hired the buildings and conducted it himself. He published *Christianity and the Christ*.

**RECALL.** See ELECTORAL REFORM.

**RECEIVERSHIPS.** See RAILWAYS.

**RECLAMATION.** No new reclamation projects were actually taken up within the fiscal year 1916. The irrigated acreage remained, therefore, about the same as in the previous year or about 860,000 acres. There were 20,000 irrigated farms, on which crops valued at \$19,000,000 were raised. The great Arrowrock dam on the Boise project in Idaho was completed during the year. This furnishes storage on the Boise River to the amount of 250,000 feet. There is sufficient water supply for 20 to 30 additional acres of land. Arrangements were made on the Lawton branch in Oklahoma. There has been

a Data are for calendar year (irrigation season) except on Salt River project, Ariz., data are corresponding "Agricultural year," October, 1914, to September, 1915.

b Area Reclamation Service was prepared to supply water.

c Irrigated crops. Excludes small areas on few projects cropped by dry farming.

d Includes 4239 acres, total area of towns contracting for water; farm area irrigated, 175,111 acres.

e Estimated. Crop reports covered 164 irrigated farms with 665 acres cropped, of which 2422 acres were not irrigated. Total crop value for 6665 acres, \$115,120, or \$17.29 per acre.

f \$22.60, excluding native pasture and other fields not in full production.

g Exclusive of Sunnyside and Snipes Mountain irrigation districts for which construction was largely completed during the year and small amounts of water delivered.

h Nampa-Meridian and Pioneer Irrigation districts; New York Canal Co. lands.

i Under private canals supplied Gunnison water.

j North Platte Canal and Colonization Co. lands. In addition stored water was delivered to a number of private canals under the terms of the Warren Act.

k Government furnished stored water to supplement insufficient normal flow rights of Lake Shore and Spanish Fork units and Clinton district.

difficulty in securing sufficient compact areas to permit economical irrigation, owing to the unwillingness of some of the land owners to subdivide and sell their holdings. The accompanying table gives a list of the projects and the crop results in 1915.

See IRRIGATION.

**RED CROSS, AMERICAN NATIONAL.** The report of Mr. Eliot Wadsworth, acting chairman of the central committee of the American Red Cross, for the year 1916 was presented at the annual meeting in Washington, December 13th. It demonstrates that in this, the twelfth year of the organization, its activities were extended further than in any previous period. Beginning on Dec. 8, 1915, the work was divided between the Department of Civilian Relief, with Mr. Ernest P. Bicknell as director general, and the Department of Military Relief, Col. Jefferson R. Kean, Medical Corps, U. S. A., director general. Especially important was the part that the latter department took in the movement for preparedness in the United States (see below). During the year the Red Cross saw an extraordinary increase in membership from 22,500 on Dec. 1, 1915, to 286,400 on Dec. 1, 1916. Campaigns for new members were carried on in the larger cities and 100,000 new members were added in greater New York alone. The number of chapters increased from 145 to 250.

The treasurer, the Hon. John Skelton Williams, reported total cash receipts for the 11 months ending Nov. 30, 1916, of \$1,544,245.43, an increase over 1915 of \$786,081.66, and total cash disbursements of \$1,352,099.46, an increase over 1915 of \$485,150.19. Of the receipts, 30 per cent were devoted to the European War Relief Fund and 16 per cent to the Preparedness Fund. It was reported that the circulation of the monthly magazine which is the official organ of the American Red Cross had increased in 1916 from 25,000 to 230,000. During the year a new building, to be occupied by the society, was under construction and it was expected that it would be completed early in 1917. At the annual meeting all the officers for 1916 were re-elected as follows: President, Woodrow Wilson; vice-president, Robert W. De Forest; secretary, Charles L. Magee; treasurer, John Skelton Williams; and chairman of the central committee, William H. Taft.

**DEPARTMENT OF CIVILIAN RELIEF.** *European War Relief.* As in 1915, a large part of the activity of the Red Cross was devoted to European war relief, to some slight extent military, but chiefly civilian. For this purpose there was received (January 1st-December 1st) \$706,234.79 and \$681,396.27 was paid out. Each month \$1000 was sent to the American War Relief Clearing House in Paris. In addition, great quantities of supplies were received and shipped. The total value of all shipments in 1916 was \$558,560.25 as against \$786,488.26 in 1915. This falling off was ascribed to the fact that since January, 1916, the general policy of the Allied governments prevented the shipment of supplies to the Central Powers unless they were to be used by American Red Cross hospital units. Arrangements were made to establish two such units in Austria-Hungary, but no agreement was reached with the German government. It was believed by the American Red Cross that the status of all neutral Red Cross societies during the present war and in the future would be

largely affected by the reestablishment of a channel for sending relief supplies to the Central Powers.

Mr. Bicknell, director general of the Department of Civilian Relief, in reporting on the aid rendered to civilian noncombatants in the war-stricken countries, emphasized the difficulties that had to be met where the wishes, regulations, and restrictions of belligerent governments had to be constantly consulted. The work of the Red Cross Commission in Serbia was stopped by the invasion of the Teutonic Allies in December, 1915. The members of the commission separated and found other fields of service, along the Albanian coast, in the Island of Corfu, and in Greece. Mr. Edward Stuart, chairman of the commission, after permission to enter southern Serbia had been refused, went to Vienna and arranged with the government to provide relief for the destitute population of northern Serbia. Accordingly, food supplies were purchased in Rumania and sent down the Danube to Belgrade, but upon the declaration of war by Rumania this avenue was cut off. However, 300 tons of supplies (food and clothing), in storage at Marseilles, France, were transported across France, Switzerland, and Austria to Belgrade and distributed. Altogether, 318 carloads were distributed during the summer and autumn. Before the end of the year, the Austrian government had asked the commission to withdraw from Serbia.

The Red Cross found it impossible to undertake any comprehensive relief organization in Poland. All attempts to obtain the consent of the Allied governments and the governments of the Central Powers for such relief failed. Through various channels—local committees, etc.—money contributions for Polish aid were made by the Red Cross to the amount of \$58,938.05. Funds collected by various Lithuanian agencies on Lithuanian day (November 1st) were turned over to the Red Cross. It was expected that the total would be not less than \$150,000. The sum of \$60,000 was sent to Constantinople for relief in that city and other communities under Turkish rule. Great difficulty was found in forwarding supplies or money for Armenian relief, but Red Cross committees in Persia and Egypt cared for a number of Armenian refugees. The acute distress in Syria was relieved only after a direct request by President Wilson had induced the Turkish government to permit importation and distribution of supplies to the starving inhabitants. In the United States October 21st and 22nd were fixed by the President as Armenian and Syrian days and a large sum of money was realized. Space for 2000 tons of relief supplies was granted by the Navy Department in the collier *Cesar*, which was to carry coal to an American warship in the Mediterranean. By this "Christmas ship" the Red Cross sent hospital and medical supplies valued at \$22,000.

*Other Civilian Relief.* The Department of Civilian Relief also has under its charge the relief of communities overwhelmed by disaster, a Town and Country Nursing Service, and the Red Cross Christmas seals. No spectacular disasters drew heavily upon the resources of the organization during the year, but in various countries and States of the United States by fire, flood, cyclone, tornado, or famine many thousands of persons were placed in need of re-

lief. The contingent relief fund expended for such sufferers amounted to \$11,257.31. A special service performed in 1916 was the relief of families of national guardsmen called to the Mexican border. Eventually an appropriation by Congress was made available for this purpose, but before that a total of at least \$100,000 had been donated by the Red Cross. The Town and Country Nursing Service, of which Miss Fannie F. Clement is superintendent, reached by correspondence 163 communities, an increase of 84 over 1915. On December 1st, 66 Red Cross nurses were at work in 21 States, 22 more than in the preceding year. They recorded 10,286 cases and 112,836 visits. During the year 17 nurses entered on special courses in preparation for Town and Country Nursing work.

The activity of this service has proven itself increasingly beneficial to small towns and rural communities where expert nurses are seldom found. It was reported that the sale of the Red Cross Christmas Seals, the proceeds of which support a large share of the anti-tuberculosis work of the country, yielded \$750,000 in 1915, as compared with \$4500 in 1907, when the seals first appeared. The total receipts from this source have amounted to \$3,200,000.

**DEPARTMENT OF MILITARY RELIEF.** This important department of Red Cross work was created by the revised by-laws adopted Dec. 8, 1915. In the words of the director-general of the department, Colonel Kean, "The object of its creation was to furnish the machinery by which the American National Red Cross could carry out the purposes of its charter so far as concerned the furnishing of volunteer aid to the sick and wounded of armies in war and as a medium of communication between the people of the United States and their army and navy. It includes the Bureau of Medical Service, the Bureau of Nursing Service, and the Bureau of Supplies. It has supervision of all the work of the chapters relating to the various branches of military relief work, such as European war relief, assistance to our own soldiers, instruction in first-aid and home care of the sick, etc. It deals directly with the military units, such as base hospitals, ambulance companies, hospital units, surgical sections, supply depots, and naval and emergency detachments of nurses which are organized with the approval of the medical department of the army and navy to reënforce these services in case of war. It administers also all agencies of assistance to the sick and wounded soldiers of foreign countries and to prisoners of war."

Deploing the inefficient and spasmodic form of Red Cross work represented by volunteer aid as given in the earlier years of the organization's history, Colonel Kean remarks in his report that plans for relief in times of emergency are still in a chaotic condition in the United States. "We are confronted," he says, "with the absurd spectacle of 130 different organizations advancing their claims to be the accepted agencies of the American people for the purpose of European military civilian relief, while several associations have assigned to themselves work with reference to our own military services, which is, by the proclamation of the President of the United States, authorized only for the American Red Cross or through its agency. The conception of profitable Red Cross assistance, which is now accepted in European countries, and in

Japan, is that in which it comes, in time of war, entirely under the control of the Military Medical Service . . . (which is) not only desirable but absolutely necessary under the conditions of modern warfare."

**Base Hospitals.** Colonel Kean reviewed the history of efforts to create Red Cross units which should be of service if the United States were engaged in war. It is only since December, 1915, that it has been possible, through the development of the Department of Military Relief, to give substance to earlier plans. In discussing the military service for the rescue of the wounded of armies in the field Colonel Kean described three zones—the Zone of the Front, that of the Base, and that of the Home Country and stated that of this structure the Base Hospital was the central span and the most important contribution which the Red Cross could make for the safety and comfort of the wounded. He stated that, although immediately and urgently needed as soon as war was declared, the difficulties of securing personnel and equipment for so complex an organization had hitherto prevented providing for it in time of peace. During 1916, however, important progress was made in the organization of Red Cross units from the staffs of physicians and nurses in civil hospitals. Medical equipment for each hospital costing \$25,000 is provided by the Red Cross, and committees of women contribute various supplies valued at \$8000. Although the Field Service regulations of the United States army require that every division of troops should have at least one base hospital of 500 beds, at the beginning of 1916 no base hospital was in existence in this country. During the year, however, 21 base hospitals were created for the army and four others authorized. Three were created for the navy, in Brooklyn, Philadelphia, and Los Angeles. The storage of equipment for such hospitals presented a difficult problem, 1900 cubic feet being required for each lot of supplies. The New York units, and possibly others, were authorized to use the buildings at the un-garrisoned post of Fort Schuyler on Long Island Sound.

A significant demonstration of what had been accomplished was given in October when Base Hospital No. 4, at Lakeside Hospital, Cleveland, Ohio (of which Dr. George W. Crile is director), was mobilized in Fairmount Park, Philadelphia, at the time when the Clinical Congress of Surgeons, the American College of Surgeons, and the National Committee on Red Cross Medical Service were all holding meetings. The camp, which covered more than 11 acres and tentage for which was loaned by the government, was erected by a detachment of the United States Medical Department under Maj. Harold W. Jones. Colonel Kean says: "The mobilization of this hospital marks an epoch in Red Cross development as concerns its obligations to assist the medical service of the armed forces in time of war." The cost of the mobilization was \$5035.75. In response to numerous requests from doctors and nurses the Red Cross secured permission from the War Department to authorize smaller units, half the size of the Base Hospitals, to be known as Hospital Units, and still smaller groups called Surgical Sections. A Sanitary Training Detachment will utilize the services of men trained in first aid. Aside from these activities the department contributed its

share toward relief abroad by sending supplies, chiefly medical. It was found that the Teutonic prisoners in Siberia were in greater need than others and most of the shipments were made to them.

Since June 1, 1916, there has been a National Committee on Red Cross Medical Service composed of 47 distinguished American physicians and surgeons. Another committee, appointed by the presidents of the five great medical associations of the United States, met under the chairmanship of Dr. William J. Mayo in Washington on April 26th and offered their services, and those of 70,000 medical men represented by them, to the President for the benefit of the army and navy. It was decided that this committee (the Advisory Committee of Civilian Physicians and Surgeons on Medical Service) should be an interlocking one with the National Committee on Red Cross Medical Service.

**THREE BUREAUS.** Detailed reports were submitted by Maj. Robert U. Patterson, Medical Corps, U. S. A., director of the Bureau of Medical Service, and by Surgeon Theodore W. Richards, U. S. N., director of the Bureau of Supplies. Miss Jane A. Delano reported as chairman of the National Committee on Red Cross Nursing Service, which met in New Orleans in May and in Washington in December. In the latter month there were 44 State committees and 71 local committees with a total enrollment of over 7600 Red Cross nurses. Of these 1600 enrolled during 1916, interest having been increased by the development of units of nurses for service in the event of war. A Bureau of Nursing Service under the supervision of the Department of Military Relief was created, with Miss Clara D. Noyes as director. The surgeon-general of the navy assigned Miss Katrina Hertzner, a member of the Navy Nurse Corps, to assist in enrolling nurses for service. See **RELIEF FOR WAR VICTIMS; UNITED STATES AND THE WAR; WAR OF THE NATIONS.**

**REDESDALE, ALGERNON BERTRAM FREEMAN MITFORD,** first Baron. A British diplomat, public official, and author, died in London Aug. 17, 1916. He was born in 1837, studied at Eton and at Christ Church, Oxford, and from 1858 was for some years in the Foreign Office and diplomatic service, stationed at Petrograd, Peking, and Tokyo. From 1874 to 1886 he held the post of secretary to the Office of Works. In 1892-95 he served as a member of Parliament. He was appointed to the Royal Commission on Civil Services and interested himself in art and educational institutions. In 1902 he was made a baron, taking an old title that had lapsed early in the nineteenth century, and in 1905 received the G.C.V.O. Lord Redesdale was called upon in 1906 to accompany Prince Arthur's mission to Japan. Among his books are: *Tales of Old Japan* (1871), which has been translated into Polish and German; *The Bamboo Garden* (he grew 40 species near his country home) (1896); *The Attaché at Peking* (1900); *The Garter Mission to Japan* (1906); *A Tragedy in Stone* (1912); *Memoirs* (1916), containing much interesting discussion of European affairs.

**REDON, ODILON.** A French painter, etcher, and lithographer, died in 1916. He was born at Bordeaux in 1840 and passed his youth in a remote part of La Gironde, where the romantic scenery and surroundings left their impress upon his character and art. Owing to ill health, his

education began late. He studied painting under Gérôme, but had a predilection for Delacroix. His art is essentially visionary, but expressed in the language of reality and shows mastery of chiaroscuro and of the rhythmic line. He was also a spirited lithographer and etcher and designed tapestries for the Gobelins. His "Les Yeux Clos" (Closed Eyes) is in the Luxembourg Gallery.

**REED, JAMES A.** Reflected Democratic United States Senator from Missouri, Nov. 7, 1916.

**REED COLLEGE.** A non-sectarian co-educational institution at Portland, Ore. In the fall of 1916 there were 280 students enrolled in the college, which provides a course in liberal arts and sciences leading to the degree of A.B. There were 21 members in the faculty. During the year Dr. Joseph A. Hart, formerly professor of education in the University of Washington, was added to the teaching staff. Reed College has an estimated endowment of \$3,000,000. The library contains 12,000 volumes. President, William Trufant Foster.

**REFERENDUM.** See **ELECTORAL REFORM.**

**REFORMED CHURCH IN AMERICA (DUTCH REFORMED).** This denomination in 1916 had 130,943 communicants, an increase of 4096 over 1915; 724 churches; and 745 ministers. For administrative purposes it is divided into four particular synods and 35 classes corresponding to the presbyteries in the Presbyterian Church. The Sunday schools had an enrollment of 131,890. The denomination contributes annually for benevolent and missionary purposes about \$500,000, and for congregational purposes about \$1,700,000. Its missionary work is in charge of the board of foreign missions, the women's foreign mission board, and the domestic missionary board. The board of education and board of publication regulate educational and publishing interests. The officers of the general synod are Peter Moerdyke, president; Henry Lockwood, stated clerk; Clifford P. Case, permanent clerk. The general synod meets at Asbury Park, N. J., in June, 1917.

**REFORMED CHURCH IN THE UNITED STATES,** known also as the **GERMAN REFORMED CHURCH.** This denomination had in 1916, 326,112 communicants, an increase of 5653 over 1915; 1773 churches; and 1245 ministers. The affairs of the denomination are administered by nine district synods, and 61 classes, corresponding to the presbyteries in the Presbyterian Church. The Sunday schools had, in 1916, over 316,832 pupils. The missions of the Church are carried on in practically all the States of the Union and in Canada. Theological seminaries are maintained at Lancaster, Pa., and Dayton, Ohio. The colleges include Franklin and Marshall College, Lancaster, Pa.; Heidelberg College, Tiffin, Ohio; Ursinus, Collegeville, Pa.; Mission House, Sheboygan, Wis.; and Catawba College, Newton, N. C. Colleges for women are maintained at Frederick, Md., and Allentown, Pa. The headquarters of the publication and Sunday school and mission boards are in Philadelphia, Pa.

**REFORMED EPISCOPAL CHURCH.** The administrative affairs of this denomination are under the control of six bishops. Foreign missions are carried on in India, and among the colored people of South Carolina domestic missions are maintained. There is a theological

seminary in Philadelphia, where the denominational organ, the *Episcopal Recorder*, is published. According to the latest available returns (1913) there were 83 ministers, 80 churches, and 10,800 communicants.

**REFORMED PRESBYTERIANS.** There are five branches included under this title: the Associate Reformed, South; the Reformed (Synod); the Reformed (General Synod); the Reformed (Covenanted); and the Reformed in the United States and Canada. The Associate Reformed, South, is the largest branch. It had, according to the latest available statistics (1915), 15,821 communicants, 155 churches, and 113 ministers. The Reformed (Synod) had 8634 communicants, 111 churches, and 128 ministers. The Reformed (General Synod) had 3300 communicants, 17 churches, and 16 ministers. The Reformed (Covenanted) had 40 communicants and 1 church. The Reformed in the United States and Canada had 360 communicants, 1 church, and 1 minister. The Reformed (General Synod) maintains two churches in India. It maintains a theological seminary in Ohio and a college at Cedarville, Ohio.

**REFRIGERATION.** Like other fields of mechanical engineering there was a pronounced tendency in refrigeration plants in 1916 to secure greater economies through more efficient engines for compression, employing those of the uniflow and high grade poppet valve types. At the same time there was an advance in multi-stage systems of compression, which, in the case of the Davis two-stage system, served to reduce the range of operating pressures in each cylinder and thus secure greater volumetric efficiency, with an estimated saving of 30 to 50 per cent in steam per ton of refrigeration. Multi-stage compression opened up great possibilities, as there were found to be the same opportunities for greater efficiency in the compression of ammonia as in the case of air, where much power was saved by multi-stage compression. An interesting paper in this field was read at the 12th annual meeting of the American Society of Refrigerating Engineers by Harry Sloan.

**REFRIGERATOR CARS.** See **HORTICULTURE.**

**REFUSE DISPOSAL.** See **GARBAGE AND REFUSE DISPOSAL.**

**REGER, MAX.** A German composer, died at Jena May 12, 1916. He was born at Brand, Bavaria, in 1873, and studied under his father and Lindner, and later for long under Riemann. While still a student he taught in the conservatory at Wiesbaden, and later, after some years at Weiden, which had become the home of his family, he went to Munich. Here he taught counterpoint at the Royal Academy in 1905-06, and thereafter till 1911 resided in Leipzig, as music director and professor at the university, teacher at the conservatory, and conductor. From 1911 he had been court conductor of the Meiningen Orchestra, a celebrated organization. Reger began early to compose, and was so prolific that at 34 he had produced 100 works. The University of Jena gave him an honorary degree of Ph.D. His compositions are especially noted for their complexities, and it is as a contrapuntist, especially in music for organ, that he resembles Bach. In Germany he became very popular. Reger wrote, besides works for organ, choral works with orchestra, chamber music, piano works, and 300 songs.

**REGULAR ARMY.** See **MILITARY PROGRESS.**

**REHAN, ADA.** An American actress, died in New York City Jan. 8, 1916. She was born in Limerick, Ireland, April 22, 1860, but her family came to New York when she was a child and settled in Brooklyn. The name was originally Crehan. Two of Ada Rehan's sisters went on the stage, one of them marrying Oliver Doud Byron, a well-known actor of the time, and two brothers became theatrical managers. When she was 14, she made her first appearance in Newark, N. J., in the Byrons' company presenting *Across the Continent*. Later, for some years, she gained experience in stock companies in Philadelphia (Mrs. John Drew's Arch Street Theatre), Baltimore, Albany, and Louisville. In the Albany company she is said to have played some 90 characters, among them Ophelia to Booth's Hamlet and Lady Anne to John McCullough's Richard III. But her period of blossoming and of great success began when Augustin Daly engaged her in 1879 for the company with which he opened Daly's Theatre in New York. With him she remained till his death, 20 years later. This period has been called the "golden age" in American theatrical achievement, and Daly was the prince of managers. Of him and of Miss Rehan, William Winter, one of the actress's most ardent admirers, says in *Vagrant Memories* (1915): "Daly rendered many, various, and important services to the theatre of his time, but his recognition and development of the genius of Ada Rehan were the most valuable of them all. In Ada Rehan the stage was illumined and graced by an actress who not only preserved, but bettered, the brilliant traditions of Peg Woffington and Dora Jordan. Her rich beauty, her imposing stature, her Celtic sparkle of mischievous piquancy, her deep feeling, her round, full, clear, caressing voice, her supple freedom of movement, the expressive play of her features, and the delightful freedom and vivacity of her action—who that ever appreciated could ever forget them? She raised the character of Shakespeare's Shrew from the level of turbulent farce, and made it a credible, consistent, continuously interesting, and ultimately sympathetic image of human nature. She was the best Rosalind ever seen in our time, or, as far as extensive reading on the subject enables me to judge, since *As You Like It* was written, and I confidently believe that within her special field—of archness, raillery, sentiment, coquetry, and noble woman-like feeling—she has seldom been equaled and never excelled."

As noted in this description, Miss Rehan became most famous for her Katharine and her Rosalind, but she also played a wide range of parts in Shakespearean comedy, as Viola, Portia, Miranda in *The Tempest*, Beatrice, Mistress Ford, Helena in *A Midsummer Night's Dream*; in Old English comedies such as *The Critic* and *The School for Scandal*, her Lady Teazle being one of her most successful roles; and in modern comedies. In London, where she appeared at intervals, she gained great popularity and high praise from the critics. After Mr. Daly's death, she did relatively little acting. In 1901 she played in *Sweet Nell of Old Drury*, in 1903-04 she toured with Otis Skinner in Shakespearean repertoire, in 1904-05 with Charles Richman starred in Shakespeare and Old English comedy, and made her last appearance in 1905 at the

testimonial to Modjeska. After the retirement, Miss Rehan lived quietly in New York, and, until the European war, went abroad each summer.

**REINDER.** See ALASKA.

**RELIEF FOR WAR VICTIMS.** The generous contributions of the United States to the innocent victims of the European war were continued through numerous organizations in 1916. The first relief organization sprang into existence in September, 1914, on account of the ravages of the German forces in Belgium. Since that time the devastation of Russian Poland and Galicia, of Serbia, and of Armenia, and Syria brought into existence various funds either for general relief in the despoiled territories or for the special relief of particular classes of sufferers. Similar organizations were formed in other neutral countries and in various of the belligerent. By far the most important relief organization in the world has been the Commission for Relief in Belgium (see below), but the Rockefeller Foundation (see ROCKEFELLER PHILANTHROPIC BOARDS) operated over a vaster territory. Numerous devices have been resorted to for raising funds for relief bodies, including newspaper appeals, endless-chain whist parties, fairs and bazaars, theatrical and musical performances, "tag" days, balls and fetes of various kinds, and appeals to the churches and other organizations. So numerous were the relief funds appealing to the American public and so frequently did they seem to overlap that there was considerable agitation in favor of their consolidation and systematization. Late in December former ambassador to France, Myron T. Herrick, suggested that President Wilson appoint a committee of distinguished persons to have general oversight of such reorganization. He declared that the United States should raise \$1,000,000,000 during 1917 for the relief of Europe, and that America's war profits should furnish most of the fund. On December 27th representatives of 12 philanthropic associations met in New York to consider the formation of such a committee.

**COMMISSION FOR RELIEF IN BELGIUM.** This was an international organization brought into existence late in 1914 by the American and Spanish ambassadors at London, the American and Spanish ministers at Brussels, the American ambassador at Berlin, and the American minister at The Hague. Its principal offices were in London, New York, Brussels, Rotterdam, and Paris, while there were national organizations not only in those countries, but in Spain, Italy, Argentina, China, Japan, and elsewhere. There was affiliated with it a woman's section. It carried out its distribution of supplies in Belgium through the Comité National de Secours et d'Alimentation. In 1915 it extended its activities to Northern France by means of the Comité d'Alimentation du Nord de la France. Its principal office in the United States is at 120 Broadway, New York City, but it has assembling depots in every State in the Union, as well as throughout the world. It supplied free transportation for all supplies, so that any gift to it reached European recipients in full value. Herbert C. Hoover is chairman of the commission.

The work of the organization was carried out through three main departments: Provisioning; Financial Relief, Exchange, and Accounts; and Benevolent. The Provisioning Department endeavored to feed from 7,000,000 to 10,000,000

people in the devastated areas of Belgium and France. During the year ending Oct. 31, 1916, there was imported 1,706,774 metric tons of food into Belgium and 483,346 tons into Northern France. Nearly one-half of this food was purchased in the United States and the remainder came about equally from Argentina and the British Empire, though small quantities came from Holland and elsewhere. From Rotterdam food supplies were distributed, largely by canal, to terminal warehouses and from these to nearly 5000 communal warehouses. For purposes of food distribution the population was treated with little or no class distinction. The Provisioning Department conducted its operations on a nominal cash (paper) basis. All citizens who were able paid out of their own funds, many were assisted by local and national governments, and the destitute were supplied through the Benevolent Department with tickets or orders. The distributing organization included a federated system of "communal," "regional," "provincial," "district," and "national" committees. Over all these the commission maintained a system of inspection and accounting. There were about 3000 communal committees in Belgium and 2000 in the north of France, embracing about 35,000 volunteer workers. These committees distributed food from local canteens or stores to civilians on the basis of bread-cards and provision-cards calling for a regular daily or weekly ration. Any profit from the sale of food tickets—amounting to over \$5,000,000 the first year—is transferred to the Benevolent Department.

The Financial Relief, Exchange, and Accounts Department not only checks financial operations of the commission, but it has facilitated the payment of millions owed to Belgians by outsiders, the transfer of funds from Belgians in other countries to friends and relatives in Belgium, and the utilization of paper money received for food in making further purchases abroad. It has thus kept many families from destitution by enabling them to utilize their credit and resources.

The total amount of money entrusted to the commission during its first two years, ending Oct. 31, 1916, was \$201,782,079. During this time it actually imported into France and Belgium food valued at \$173,658,916; and had purchased additional food valued at \$28,123,163. Of these vast sums there had been advanced by the British and French governments through the Belgian government for the relief of Belgium, \$108,121,358. Various French institutions had advanced in loans to the communes and Northern France for destitute persons of Northern France \$66,155,501. Public subscriptions in Great Britain amounted to \$13,689,670; in the United States, \$8,747,138; and in other countries \$1,066,963. In contrast to the small subscriptions in the United States was the expenditure of \$100,000,000 of the commission's funds in this country. The public subscriptions in Great Britain, United States, and other countries included not only cash, but food and clothing. The overhead expense for the year 1916 was five-eighths of 1 per cent.

The Benevolent Department was that through which the charity of the world was made available for destitute Belgians and French. Its problem has steadily increased. Late in 1914 there were estimated to be in Belgium alone

1. A Relief Ship sailing from Norfolk, Va., flying flag of the Commission and having the appropriate marking on the side
2. A Steamship discharging at Rotterdam supplies purchased in the United States by the Commission
3. Feeding Belgian Children

WORK OF THE COMMISSION FOR RELIEF IN BELGIUM

1,200,000 wholly or partially destitute persons; a year later their number was 3,500,000, or nearly one-half the entire population. Their support during the year ending October, 1915, required \$54,409,000; in the succeeding year the cost had grown to \$10,000,000 per month, which was required also for 1917. In Northern France the entire population of 2,125,000 was practically destitute, but their support was provided mainly from funds secured by loans of the communes. It must be noted too that most of the funds provided for this department in Belgium were advances of the French and English governments to the Belgian government. The work of this department therefore involved a correlation of the world's charity with previously existing charitable organizations in the devastated area and the administration of funds supplied by governments. About 3000 communal charity committees were organized. These were the medium through which the worthy needy secured supplies or tickets on the public canteens of the Provisioning Department. For the wholly destitute there were provided also clothing and shelter. Every effort was made by local committees to provide self-help and by the central organization to cultivate self-reliance on the part of the communal committees. In addition special charity committees for numerous special problems due to the war were created; and a system of support of public services and special institutions to aid established organizations.

Public charity from abroad was used to aid in provisioning, clothing, and sheltering the destitute through the communal committees. It was also used to assist the following through special committees: Children, farmers, lace-workers, refugees, artists, doctors and pharmacists, the dispossessed, Belgian prisoners of war, war cripples, the tubercular, destitute young mothers, Cardinal Mercier's clergymen's fund, the Antwerp workrooms, and 20 other causes. The services maintained by government subsidy were: Allowance to families having lost bread-winners; additional allowances to the destitute; advances to families of officers; and advances to a loan society, to educational institutions, to savings banks, and to the communal governments.

It was estimated in December that there were fully 1,000,000 destitute children in Belgium alone. The cost of their maintenance during 1917 was estimated at a minimum of \$1,000,000 a month. This was only \$1 per month for each child to pay for a special noonday lunch in schools and other public institutions. The cost of feeding the remainder of the destitute population was estimated at \$9,000,000 per month; thus a total of \$10,000,000 a month was needed in 1917. The commission sent Dr. Lucas of the University of California to inspect the schools and hospitals with a view to determination of the adequacy of maintenance. He declared that while the rations supplied were sufficient to maintain both adults and children for a short period of time they were inadequate for indefinite periods. The rations failed to provide for the necessary growth of children and for the maintenance of adequate powers of resistance on the part of both children and adults. Dr. Lucas found, especially among children, many diseases clearly due to malnutrition and an alarming spread of tuberculosis.

**POLISH RELIEF.** It was recognized early in

1915 that the devastation of Poland had created a relief problem equal to or even greater than that existing in Belgium. Consequently the Rockefeller Foundation sent agents to Poland to investigate the need and to take steps toward the organization of an International Commission for Relief in Poland. A plan was formulated and signed by Dr. Theodore Lewald for the Imperial German government, Ambassador Gerard for the proposed International Commission, and Ernest P. Bicknell for the Rockefeller Foundation War Relief Commission. A German committee pledged itself to raise \$500,000 per month for food and the Rockefeller Foundation pledged \$10,000 per month to defer administrative expenses. The German and Austrian governments pledged themselves to requisition no food in that part of Poland occupied by their forces, and not to levy money requisitions on any occupied part of Russian Poland except military fines, and it was agreed that the International Commission might send its agents through any of the occupied territory. Agents of the commission thereafter visited all parts of Europe looking for available supplies of wheat, but failed of success. It became evident then that supplies must be brought in through the British blockade. For an account of the failure of the American plan for the relief of Polish sufferers, see *WAR OF THE NATIONS, Question of Polish Relief.*

**AMERICAN AMBULANCE IN FRANCE.** One of the most important of the American relief activities was the maintenance of ambulances on the western military front, and also at Saloniki. This organization was composed of 7 sections, each section having 20 ambulances, one or two staff-cars, one or two supply-cars, or about 25 cars in each section. These ambulances were used in transporting wounded from the front and especially from trains to hospitals. It was estimated that they had transported about 250,000 wounded from the beginning of the war to the close of 1916. A total of about 500 men had been in the service from the beginning of the organization, most of them college men. Thus 108 men had gone from Harvard, 40 from Yale, nearly as many from Princeton, and smaller numbers from about 35 other colleges. The ambulance also supported one of the largest hospitals at Paris. It also organized the American Relief Clearing House which became the centre of American relief work in France, and which was backed by the War Relief Clearing House at New York. There was organized also the Refuge Relief for the homeless of all nations.

**JEWISH RELIEF.** The great urgency of special relief for Jewish war victims was shown in the official proclamation of President Wilson, setting aside Thursday, January 27th, as a special day for the collection of contributions in aid of the Jewish people driven from their homes and made destitute by the war. In this proclamation the President declared that, "in the various countries now engaged in war there are 9,000,000 of Jews the great majority of whom are destitute of food, shelter, and clothing." About \$100,000 was collected on that day by organizations throughout the United States. The principal organizations in charge of the collection and distribution of the relief funds for the Jewish people have been the American Jewish Relief Commission for Sufferers from the War, organized with Felix M. Warburg, 52

William Street, New York City, as treasurer, and the Central Committee for the Relief of Jews Suffering through the War, organized largely through the activities of Leon Kaimaiky, editor of the *Jewish Daily News*, with Harry Fischel, 63 Park Row, as treasurer. This latter organization carried on a special propaganda throughout the country and collected more than \$1,500,000 in 1916. Its contributions were mostly in small sums, showing that the appeal had reached all ranks of the Jewish population. On December 21st, the anniversary of a memorable meeting in Carnegie Hall in 1915, was given a remarkable demonstration of the willingness of American Jews to aid their kinamen abroad, nearly \$3,000,000 being subscribed toward a \$10,000,000 fund which is to be completed in 1917. This fund was under the auspices of the Joint Distribution Committee, 20 Exchange Place, New York, through which various organizations interested in Jewish relief were coordinating their efforts. See also **Jews and Judaism**.

In Great Britain had been formed in 1915, the Russian Jewish Relief Fund, and in Russia, Poland, Austria-Hungary, and various places in the Near East had been formed local committees through which distribution was made. The largest sums sent by the Joint Distribution Committee had gone to Russia, German Poland, and Galicia. Nevertheless, considerable sums were forwarded to Palestine, Greece, Turkey, Alexandria, Tunis, Algeria, Morocco, to Jewish students in Swiss universities, and destitute families of Russian Jews in France. Moreover, several million dollars had been forwarded to various war zones through the joint committee's transmission bureau as remittances from friends and relatives. The committee also sought to reunite broken families, relatives, and friends.

The Federation of Rumanian Jews of America held a conference in New York City, at which plans were laid for raising \$1,000,000 for the relief and emancipation of Rumanian Jews.

**AUSTRO-GERMAN RELIEF FUNDS.** A number of organizations devoted their activity to securing funds for the relief of citizens of the Central Powers who were victimized by the war. Thus the General Relief Fund for the German War Sufferers, Charles Froeb, treasurer, 531 Broadway, Brooklyn, reported gifts of nearly \$550,000. The Teutonic War Relief Committee, 42 Broadway, raised more than \$25,000 for suffering noncombatants in Germany, Austria-Hungary, Poland, Turkey, and Bulgaria, through the sale of special stamps. The Prisoners of War Relief Fund had received about \$375,000 in cash and reported that winter outfits had been contributed for the prisoners of war in Siberia valued at over \$700,000. The American Relief, aided by a special appeal of Ambassador James W. Gerard in behalf of German widows and orphans of the war, had collected nearly \$80,000. There was in addition the American Collection for German War Orphans, of which Knaught, Nachod, and Kuhne were treasurers. The East Prussian Relief Fund, 15 Union Square, also reported contributions of many thousands. The American Physicians Expeditions to Germany and Austria-Hungary, 122 Hudson Street, with its women's auxiliary committee, collected funds for the wounded in hos-

pitals and for sending American physicians for hospital work in Germany and Austria.

**SERBIA, ARMENIA, AND SYRIA.** Among the organizations particularly interested in relief in Serbia was the Serbian Hospitals Fund, 23 East 26th Street, which collected about \$55,000 from March to the close of the year. The Franco-Serbian Field Hospital of America, 17 West 30th Street, received generous support. The Serbian Relief Committee, 70 Fifth Avenue, was the principal organization, however, securing funds for Serbian victims. Its collections to late December amounted to \$325,000.

The terrible ravages of the Turks in Armenia and Syria resulted in active sympathy on the part of the entire American nation. In both areas the Turks had terrorized the population, had deported large numbers, and killed many who were suspected of disloyalty. The extensive and intense suffering resulting therefrom caused the Government of the United States to request the Turkish government that a neutral committee be permitted to undertake relief work in the devastated areas. That government replied that such relief was unnecessary. Thereupon the State Department instructed the American chargé d'affaires at Constantinople to warn the Ottoman government that friendly relations would be disturbed unless heed were given to the request. Thereafter avenues were opened up whereby relief could be sent in. About December 1st a "Christmas ship" was dispatched to Beirut, Syria, with a cargo of food-stuffs and new clothing to be distributed by the agents of the American Red Cross and the Red Crescent with the assistance of the United States consuls. In addition the American Committee for Armenian and Syrian Relief had dispatched through the State Department to various centres \$208,000 to be used in the purchase of grain, blankets, and clothing. The Christmas ship carried 600,000 pounds of rice, 200,000 pounds of lima beans, 400,000 pounds crushed wheat, 2,100,000 pounds of whole wheat, 500,000 pounds of sugar, 1000 cases of condensed milk, 10,000 barrels of flour, 50,000 gallons petroleum, and 25,000 gallons cotton-seed oil, besides immense quantities of underwear, sweaters, shoes, stockings, socks, blankets, and unbleached muslin.

**OTHER FUNDS.** Among the organizations operating in the United States, their addresses and the approximate amount of their contributions in 1916 may be mentioned the following: The Lafayette Fund, the Vanderbilt Hotel, New York, provided kits for French soldiers; it had collected by the close of 1916 about \$165,000. The Secours National Fund for the Relief of Women and Children of France, 16 East 47th Street, New York City, \$237,000. The Secours Duryea, 19 East 37th Street, New York City, maintained a relief depot at 11 Rue Louis le Grand, Paris. The fund for the American Ambulance in Russia had received \$76,800 by means of which 20 ambulance units were being maintained with the Russian armies; William H. Hamilton, 665 St. Mark's Avenue, Brooklyn, was treasurer. The Relief Fund for French Civilian Prisoners in Germany, with headquarters in New York City, received substantial donations for its purposes. The British War Relief Association, Incorporated, with Dr. Louis L. Seaman, president, and Henry Clews, treasurer, maintained headquarters at 542 Fifth Avenue.

It organized the Fund for Rumanian War Relief, aided hospitals and other relief work in Great Britain, and sent comfort kits to British soldiers. The Dollar Christmas Fund for Destitute Belgian Children cabled more than \$100,000 to help in feeding sick and destitute children in the winter of 1916-17. It made a special appeal for a minimum Christmas donation of \$100,000. The British-American War Relief Fund, Mrs. Frederick W. Whitridge, acting president, received contributions at 681 Fifth Avenue. The Russian-American Relief Association, the Flatiron Building, Mme. Bakhmeteff, wife of the Russian ambassador to the United States, honorary president, had received \$35,000 up to the middle of December. The American Committee for Training in Suitable Trades the Maimed Soldiers of France, the Biltmore Hotel, New York, had collected about \$180,000 in 1916, which sum was to be used in establishing and maintaining trade schools and two model agricultural training schools for maimed French soldiers. A Fund for the Fatherless Children of France, 111 Broadway, New York City, had collected about \$120,000. The Cardinal Mercier Fund, organized to secure means for the relief work of Cardinal Mercier in Belgium, received subscriptions through J. P. Morgan and Company, 23 Wall Street. The Polish Victims' Relief Fund, 33 West 42d Street, had collected about \$560,000 by the close of 1916. This was sent to a committee in Switzerland headed by Henryk Sienkiewicz and thence distributed to Poland. It was not a tithe of the amount needed. The Polish University Grants Committee of this fund received donations for destitute professors and scientists, scholars, and students who had taken refuge in France and Switzerland. The Committee of Mercy, the Committee for the Relief of Belgian Prisoners in Germany, the National Allied Relief Committee, and the French Heroes' Fund had offices at 200 Fifth Avenue, as did also the Charities of the Queen of Belgium Fund, and the Central Committee for the Relief of Lithuanian War Sufferers. The American Girls' Aid, 293 Fifth Avenue, had collected over \$43,000. The American Aid for Homeless Belgian Children, a fund sanctioned by King Albert, Cardinal Gibbons, and others, received generous support from contributions sent to the National City Bank. The National Surgical Dressings Committee, Mrs. Mary H. Willard, international chairman, was located at 299 Fifth Avenue. The American Branch of the Prince of Wales National Relief Fund had received \$182,000 through R. M. S. Wortley, 25 Broad Street. Gifts for the Noel du Soldat Belge were received by Paul Dumont, 10 Bridge Street. The Vacation War Relief Committee, Miss Anne Morgan, chairman, made in December an appeal for wooden boxes in which to ship clothing and personal kits for soldiers in the French hospitals. It had collected over \$325,000. Mrs. Gertrude Atherton was president of Le Bienêtre du Blessé, John Munroe and Company, treasurer, 30 Pine Street; it had collected \$3705. The War Babies' Cradle, 42 Broadway, collected funds to provide bed, food, and 10 days' care during confinement for destitute French women whose husbands were in the army. The American Comfort Packet Committee, 66 West 39th Street, had sent more than 9000 packets to the war front. In addition to the several funds above noted for the relief of French children,

the American Society for the Relief of the French War Orphans, 120 Broadway, sent an appeal to all parts of the United States and Canada in behalf of 200,000 destitute children in France. In December it reported contributions sufficient to support 5000 children during the winter. The American Authors' Fund for the Relief of Wounded Soldiers of the Allied Nations, 33 State Street, Boston, was organized by William Dean Howells, president, A. Lawrence Lowell, and other men and women of letters. The Federal Council of Churches of Christ in America sent nearly \$100,000 for the relief of French churches of Union Nationale des Eglises Réformées Evangeliques de France. Still other funds included that raised by the Committee on Destitute Children of Flanders, 21 East 11th Street; the American Girls' Aid, 203 Fifth Avenue, which had collected more than \$45,000 and sent over 6200 cases of clothing and supplies to French war sufferers; the American Aid for Homeless Belgian Children, National City Bank, treasurer; the Blue Cross Fund, which sought means for the care of wounded horses, 55 East 93rd Street.

See RED CROSS; ROCKEFELLER PHILANTHROPIC BOARDS.

**RELIGION, BOOKS ON.** See LITERATURE, ENGLISH AND AMERICAN.

**RELIGIOUS DENOMINATIONS AND MOVEMENTS.** Statistics of the religious denominations of the United States in 1916 were prepared by the religious statistician, Rev. Dr. H. K. Carroll, associate secretary of the Federal Council of the Churches of Christ in America. The results are given in the accompanying table. The statistics cover only the territory of the United States, the ministers, churches, and communicants of the various denominations in foreign countries being deducted from the denominational totals. The preference has been given to official returns where it has been possible to obtain them, and where such returns have not been obtainable, the best denominational sources of information have been consulted for approximate figures. It is chiefly the very small religious bodies that report no official returns, or imperfect returns. In a few instances the denominational officials, usually statisticians, have given an estimate of the annual increase, when the official reports had not been completed. The tables are arranged alphabetically and the basis of classification is name or historical relation. The few non-Christian bodies are easily separable from the Christian.

The true meaning of the returns will not be clear until the reader understands the various principles of classification on which they are based. For example, the membership returns of the great Methodist, Baptist, Lutheran, and Presbyterian denominations do not afford an adequate idea of the population represented by them. Moderate estimates of Methodist statisticians place the denominational population at two and a half times the membership, which would amount in 1916 to over 19,000,000. The Methodist population would rarely be placed lower than 16,000,000 or 17,000,000 even by conservative estimates. A similar method should be followed in estimating the population of the other great Protestant denominations.

The Roman Catholic Church reports only "population," which includes with communicants the unconfirmed baptized, that is, children

who have not been admitted to confirmation. According to the rate of the census of 1890 and also that of 1906 there was a deduction of 15 per cent from the Catholic population and the remaining 85 per cent was set down as communicants. To objections made against this method the obvious reply is that the rule to report only members or communicants applies to all denominations, and that there is no convenient way of making an exception to the Roman Catholic returns.

The Jewish statistics in this table are misleading, since there are no public returns made by that denomination and nothing later than the figures gathered directly by circular from congregations by the government in 1906 is available. The census gives an even smaller number of members than this table, counting only heads of families, according to the Jewish rule. See JEWS AND JUDAISM.

No official returns are made by certain small churches, including the Christian Catholic Church (Dowie) and the Catholic Apostolic Church. No official returns of membership have been given by the Church of Christ Scientist since 1907.

Changes in the totals for 1916 have been made because in some cases the denominational returns were not correct and were revised later by those who first made them. In other cases advance estimates given before regular returns came in needed to be slightly increased or decreased.

Dr. Carroll's figures show that the churches of the United States have not suffered financially from the European war and the increased cost of living, nor has their usual rate of growth declined. Millions of dollars have been freely sent by them to the war-afflicted populations of Europe and Asia, and yet they have gone on with their regular work, evangelistic, missionary, benevolent, and educational, with undiminished force. In 1916 the Protestant, Catholic, and Eastern Orthodox Churches had an aggregate of more than 40,000,000 communi-

cants or members, going beyond the 40,000,000 mark by nearly 2000. The net increase of the year was 732,000, or 189,000 more than the increase for 1915. In 1890 the total religious strength was 20,618,000, so that in the 26 years following the net increase has been 19,383,000, or 94 per cent, while the gain in the population of the country for the same period has been about 39,000,000, or 61 per cent. The religious denominations have therefore gained faster than the population. Of the gains in 1916, about 216,000 were of the Roman Catholic and about 500,000 of the Protestant bodies. Among the latter, a gain of 136,000 is recorded by the Methodist, 132,000 by the Baptist, and more than 79,000 by the Presbyterian and Reformed. The Disciples of Christ had a gain of 44,000, the Episcopal Church of 27,000, and the Lutherans of 20,000.

In 1916 there was a gain over 1915 of only 109 in the number of churches; but in 1915 there was a net loss. The small increase in 1916 is due to decreases reported by several denominations and denominational groups. An apparent loss of 769 by the Disciples of Christ is caused by the defective counting of previous years. The Methodist Episcopal Church lost 68, the Northern Baptists 33, the Northern Presbyterians 97, the Episcopalians 7. These and other losses reduce the considerable gains of the Roman Catholics, 199, the United Brethren, 70, the Lutheran Synodical Conference, 105, etc. Rural churches were evidently closed or merged for economical reasons.

The gain in ministers is 2618, nearly double that of 1915. The largest gain is 478, reported by the Roman Catholic Church; the Baptists gained 365, the Lutherans 159, and other denominations made smaller gains.

Statistics for Sunday schools in the United States for 1916 show a much larger aggregate of Sunday school scholars than in any previous report, and that the net increase in 1906-16 was more than 6,300,000, with a gain of between 15,000 and 16,000 schools.

**RELIGIOUS PHILOSOPHY.** See PHIL-  
OSOPHY.

**REMEDIAL LOANS.** See LOAN SHARKS.

**BENSSELAER POLYTECHNIC INSTI-  
TUTE.** A non-sectarian institution for the  
technical education of men at Troy, N. Y. It  
was founded in 1824. In the several depart-  
ments there were 665 students enrolled in the  
fall of 1916 and the faculty numbered 63. Dur-  
ing the year Lewis F. Moody, professor of hy-  
draulic engineering on the Russell Sage Founda-  
tion, resigned and R. L. Daugherty was ap-  
pointed to succeed him. A dining-hall was pre-  
sented by Mrs. Russell Sage, dormitories by Al-  
fred T. White and Capt. Robert W. Hunt, and a  
wireless telegraph installation by W. A., C. G.,  
and G. A. Roebling. I. C. Blandy, '87, gave \$8000  
to establish a scholarship. In productive funds  
the institute has \$1,550,000, from which in 1916  
it drew an income of \$69,000. The library con-  
tains 11,300 volumes. President, Palmer Cham-  
berlaine Ricketts.

**REORGANIZATIONS, RAILWAY.** See RAIL-  
WAYS.

**REORGANIZED CHURCH OF JESUS  
CHRIST OF LATTER DAY SAINTS.** This  
is a separate organization of Mormons claim-  
ing to be the true successor of the original  
church founded in 1830 by Joseph Smith. It  
was reorganized in 1852. Its chief offices are at  
Lamoni, Iowa. In 1916 it had 78,326 members,  
about 1200 ministers, 38,938 Sunday school pu-  
pils, and 746 Sunday schools. Its officers are:  
Benjamin R. McGuire, presiding bishop; Rich-  
ard S. Salyards, general church secretary.

FLOODS; IRRIGATION.

**RESIDENCES.** See ARCHITECTURE.

**RESUSCITATION.** Prof. Yandell Hender-  
son, of Yale University, who has acted as con-  
sulting physician to the United States Bureau  
of Mines, attempts to estimate the value of the  
various forms of resuscitation apparatus which,  
in increasing numbers, are being exploited in  
response to the "safety first" movement. Hos-  
pitals, gas works, electric light and telephone  
companies, city police and fire departments,

etc., are constantly applying for information as  
to the relative value of the work done by such  
instruments. The first instrument to attract  
attention was the pulmotor. This is a device  
comprising a tank of compressed oxygen, con-  
necting, through a reducing valve, with an in-  
jector, so that a considerable volume of air is  
drawn in through a hose attached to a face  
mask. Contrary to the general belief that pure  
oxygen, or air greatly enriched by oxygen, was  
thus furnished, analyses showed that the oxy-  
gen content of the mixture supplied was about  
28 to 30 per cent; and as pure air contains 21  
per cent of oxygen, the amount of enrichment  
therefore was not considerable. The force of  
the air coming from the injector is actuated by  
an ingenious mechanical device, by which a  
valve is alternately thrown in one direction or  
the other, so that the air is blown into or sucked  
from the mask fastened over the patient's face.  
In order for this device to reverse, however, a  
considerable positive or negative pressure is  
necessary, and these pressures come just at  
those points in respiration at which they are  
most unnatural. Furthermore, in case of any  
obstruction to the flow of air, the positive and  
negative pressures necessary to reverse the ap-  
paratus are induced in such rapid succession  
that the suction and injection phases alternate  
too rapidly for the subject's lungs to be prop-  
erly distended and deflated. This is liable to  
occur if for any reason there is an obstruction  
in the throat. Some parts of the injector or  
reducing valve are also found liable to get  
out of order, thereby rendering the apparatus  
ineffective.

The objection to the pulmotor concerned not  
only its deficiencies as a means of adminis-  
tering artificial respiration, but also its extra-  
ordinary effect on public opinion. A later model  
of the pulmotor has been made (model B), the  
mechanism of which is rather delicate and eas-  
ily put out of order and is similar to the ori-  
ginal model excepting that the automatic feature  
is eliminated.

The lungmotor consists of two pumps, fast-  
ened together in such a way that the down  
stroke forces air from one pump into a mask  
fitted over the patient's face, while the up  
stroke withdraws air from the lungs into the  
other pump. An oxygen tank may be connected

with the apparatus so that the air injected can be enriched with oxygen to any desired degree.

The vivator is a still simpler instrument, consisting of one pump, which forces air through a tube to the mask with the down stroke of the plunger and of a valve which opens to allow the air to escape during the up stroke. With both vivator and lungmotor it is possible that a somewhat excessive positive pressure may be made, and Henderson advises that in such apparatus there should be a blow-off valve or some similar device set to open under a water column pressure of 10 inches; and when there is also a suction pump, there should be an inlet valve set to open under pressure of six inches. Henderson comes to the conclusion that: (1) Universal training in the prone pressure manual method of artificial respiration will accomplish more for resuscitation from drowning, electric shock, and asphyxia than is possible by providing any amount of apparatus. (2) Artificial respiration with apparatus is superior to the manual method, in that the apparatus is capable of giving a normal volume of pulmonary ventilation, while the manual method is not. (3) Nevertheless, the immediate application of a poor method is far more important than the application of a perfect method after a delay of even five minutes. The knowledge that apparatus is available is liable to result in a neglect of immediate manual treatment in order to have the apparatus brought from a distance. (4) Apparatus should be provided only in places in which it will be immediately available. (5) Since artificial respiration with air more or less enriched with oxygen is all that any apparatus yet invented affords, it should be of a simple type so as not to produce exaggerated ideas of its efficiency. (6) Oxygen inhalation should be used immediately in gas and smoke cases, but the apparatus employed should be such as to allow the oxygen to reach the patient's lungs in efficient concentration. Such apparatus should go with every artificial respiration device. (7) Investigation of the use of artificial respiration apparatus in *asphyxia neonatorum* is needed.

**RÉUNION, or BOUBON.** A French colony; an island in the Indian Ocean, covering 1980 square kilometers (764 square miles), and having (1911) 173,822 inhabitants. Saint Paul (7 square kilometers), New Amsterdam (66), and Kerguelen (3414) are administratively attached to Réunion. Saint-Denis (26,689 inhabitants) is the capital.

**REVENUE, GOVERNMENT.** See articles on various countries and on States of the United States; also FINANCIAL REVIEW.

**RHINE-ELBE CANAL.** See CANALS.

**RHODE ISLAND. POPULATION.** The estimated population of the State on Dec. 31, 1916, was 620,090. The population in 1910 was 542,610.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture, in 1915-16 were as follows:

	Acreage	Prod. Bu.	Value
Corn ..... 1916	11,000	341,000	\$471,000
..... 1915	12,000	516,000	516,000
Oats ..... 1916	2,000	54,000	37,000
..... 1915	2,000	66,000	33,000

	Acreage	Prod. Bu.	Value
Potatoes .... 1916	5,000	370,000	684,000
..... 1915	5,000	550,000	508,000
Hay ..... 1916	60,000	81,000	1,620,000
..... 1915	57,000	71,000	1,598,000

a Tons.

See AGRICULTURAL LEGISLATION.

**MANUFACTURES.** The census for manufactures taken in 1914 and completed in as far as the figures relating to the individual States are concerned, in December, 1916, disclosed the following comparative condition of manufactures in 1909 and 1914:

	1909	1914
Number of establishments ..	1,951	2,190
Average number of wage earners .....	118,538	113,425
Capital invested .....	\$290,901,000	\$308,445,000
Wages .....	55,234,000	59,366,000
The value of materials used .....	158,192,000	162,425,000
The value of products .....	280,344,000	279,546,000

**TRANSPORTATION.** The total mileage of main track in the State in 1916 was 1972, practically all of which was operated by the New York, New Haven, and Hartford or its subsidiary companies.

**EDUCATION.** The total school population of the State in 1916 was 129,985. The total enrollment was 87,064. The average daily attendance was 76,337. The teachers, male and female, numbered 2680. The average yearly salary of teachers is \$714.37.

**FINANCE.** The report of the Treasurer for the fiscal year ending Dec. 31, 1916, shows receipts amounting to \$3,815,477, and payments amounting to \$3,782,639. There was a balance on Dec. 31, 1916, of \$31,390.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the State Hospital for the Insane, House of Correction, State Alms House, the State Prison, State Providence County Jail, Sockanosset School for Boys, and the Oaklawn School for Girls. The Rhode Island State School for the Feeble-Minded is under the State Board of Education.

**POLITICS AND GOVERNMENT.** An unusually lively campaign was experienced in Rhode Island where, for the first time, a United States Senator was elected by the direct vote of the people. The presidential and senatorial elections, together with the election of a complete list of State officials, including a legislature of 139 members, and municipal elections in nearly all of the 39 cities and towns in the State, combined to create a most acute interest in every section.

The official vote cast for the leading candidates in the State for congressional and State offices follow: President: Hughes, 44,858; Wilson, 40,394; Benson, 1914; plurality for Hughes, 4464. United States Senator: Peter G. Gerry, Dem., 47,048; Senator Henry F. Lippitt, Rep., 39,211; Fred Hurst, Soc., 1996; plurality for Gerry, 7837. Governor: R. Livingston Beekman, Rep., 49,524; Addison P. Munroe, Dem., 38,158; John Holloway, Soc., 2167; plurality for Beekman, 13,366. Congress: First District, Congressman George F. O'Shaunessy, Dem., defeated Ezra Dixon, Rep.; Second District, Congressman Walter R. Stines, Rep., defeated Sumner Mowry, Dem.; Third District, Congressman Ambrose Kennedy, Rep.,

defeated Joseph McDonald, Dem. The Republicans retained control of the General Assembly, but the margin was considerably decreased, especially in the State Senate.

Officially the political campaign did not get under way until the middle of September, but the Republican slate had been known for many weeks with the exception of the nominee for Congress in the first district. Ezra Dixon of Bristol defeated Guy Norman of Newport for the nomination at the convention. The first of the series of caucuses, three being required by each party to complete the State and municipal delegations, was held on September 19th. Then followed the series of conventions, four for each of the major parties. A State convention nominated presidential electors, United States senator, Governor, and other general State officers. There was also held one convention for each of the three congressional districts. The first State convention was the Socialist, on September 28th. Then came the Democratic on October 5th, and the Republican on October 11th. A brief synopsis of the major parties' State platforms follows:

**Republican.** Endorsed national platform, declared for adequate military preparedness, and condemned Democratic handling of preparedness situation; condemned interference in Mexico, with record of "incompetence, timidity, and vacillation" on the part of the President; declared for a protective tariff; endorsed Hughes, Lippitt, and Beeckman; condemned Democratic extravagance; favored woman suffrage "but recognizes the right of each State to settle this question for itself."

**Democratic.** Endorsed national platform and Democratic preparedness moves; endorsed Wilson for "honorable peace" and for averting railroad strike; endorsed Federal reserve and rural credits legislation; condemned practice of "bribery" in Rhode Island elections, and "mismanagement" of State finances; demanded several constitutional amendments, and asked for test vote referendum on the woman suffrage question.

Both parties brought in speakers of national reputation. Mr. Hughes was in the State before nomination, and afterward; Vice-President Marshall delivered a political address. The Republicans held a torchlight procession and the Democrats an automobile illuminated cavalcade. Noonday rallies were held at mill gates during lunch hours by both parties. A large quantity of literature was sent out by mail, but only a small portion went on congressional franks. Extensive advertising campaigns were conducted in the newspapers by both parties, and on election day the customary efforts to "get out the vote" were used. The vote was heavy and the number of ballots cast to the number eligible to vote was unusually high. The very great proportion of "split" tickets cast in 1916 is indicated by the figures, which give a Republican Governor 13,366 plurality and a Democratic United States senator 7837 plurality, each elected on a State-wide campaign by the same electorate.

**LEGISLATION.** The Legislature met in 1916, and passed many measures of importance. A record of these is given below:

The organization of cooperative agricultural associations was authorized. A measure was passed for finding a legal bushel for foreign

products. New laws were passed relating to the regulation of motor vehicles. The laws relating to taxation were amended, as were also the laws relating to health and sanitation. The laws relating to banks and banking received important amendments.

**STATE OFFICERS.** Governor, R. Livingston Beeckman; Lieutenant-Governor, Emery J. San Souci; Secretary of State, J. Frederick Parker; Attorney-General, Herbert A. Rice; Treasurer, Walter A. Read; Adjutant-General, Charles W. Abbott, Jr.; Auditor, Charles C. Gray; Commissioner of Public Schools, Walter E. Ranger; Commissioner of Insurance, State Auditor, ex-officio—all Republicans.

**JUDICIARY.** Supreme Court: Chief Justice, Clarke H. Johnson; Associate Justices, C. Frank Parkhurst, W. B. Vincent, William H. Sweetland, Darius Baker; Clerk, B. S. Blaisdell.

STATE LEGISLATURE:

	Senate	House	Joint Ballot
Republicans .....	25	66	91
Democrats .....	13	83	46
Independent .....	1	..	1
Republican majority..	11	33	44

**RHODESIA.** A British protectorate (named for Cecil Rhodes) in South Africa, administered by the British South Africa Company. It is divided into Northern and Southern Rhodesia.

**NORTHERN RHODESIA** consists of the two former provinces of Barotseland (Northwestern Rhodesia) and Northeastern Rhodesia, and was constituted a single British sphere in 1911. Its area is estimated at 291 square miles and its native population (1911) at 821,102. The administrator resides at Livingstone. Other towns are Fort Jameson, Broken Hill, and Lealui (the province of the native king, Lewanika, chief of the Barotse).

**SOUTHERN RHODESIA** contains Mashonaland and Matabeleland: total area, 148,575 square miles. A census taken May 7, 1911, showed a total of 23,606 Europeans; 12,631 in Mashonaland, 10,975 in Matabeleland. Native population, 744,559 (495,451 and 249,108). Salisbury, the capital, had 3479 white inhabitants; Bulawayo (5200 whites) is the commercial centre.

**PRODUCTION.** Large tracts have been brought under cultivation (cereals, vegetables, tobacco, fruits, etc.), and the country is admirably adapted to the raising of stock of all kinds.

The following table gives trade statistics for calendar, and financial statistics for fiscal, years:

	1908-9	1910-11	1911-12	1914-15
Imps. ..	£1,818,372	£2,786,321	£2,975,112	£2,768,584
Exps. ..	2,718,476	3,018,099	3,098,400	2,958,055
Rev. ...	564,399	784,908	817,354	825,500
Expend. .	535,150	684,688	737,578	895,634

**RHONDDA, BARON.** See GREAT BRITAIN, Government.

**RHUS POISONING.** Some new light has been thrown on the nature of this subtle poisoning and the method by which it spreads. The plants commonly implicated are *Rhus diversiloba T. and G.*, or poison oak; *Rhus toxicodendron L.* (poison ivy), and *Rhus vernio L.*, Japanese poisonous sumac. Largely due to the studies of McNair of the University of California, it is now definitely proved that the toxic substance is a nonvolatile resin which

does not reside in the pollen or plant hairs, and that the part of the plant to be feared is the resinous sap. The sticky exudation flowing from an injured plant may come in contact with the hands or other exposed parts of the body, or may be carried indirectly on clothing or tools, or by insects, smoke, etc., some distance from the neighborhood of its origin. The irritant resin, having once come in contact with the skin, is diffused slowly through the sweat glands, hair follicles, and even through the skin itself, where this is thin.

McNair does not believe that sufficient poison can be carried by an insect to give rise to a severe case of rhus poisoning, but mild cases may thus arise. He also calls attention to the great increase in white corpuscles during severe attacks (sometimes more than 12,000 leucocytes to a cubic millimeter) accompanying the constitutional reaction, with fever, coated tongue, and faint albuminuria.

**RIBOT, ALEXANDER.** See FRANCE, *History*.

**RIBOT, THÉODORE ARMAND.** A French psychologist, died Dec. 9, 1916. He was born at Guingamp, Dec. 18, 1839, and was educated at the Lycée de Saint-Brieure and at the Ecole Normale, Paris, where he received a doctor's degree in 1875. After filling the chair of philosophy at various lycées for several years he went to Paris and studied psychology on the physiological and experimental side, using for that purpose the histological and physiological laboratories, and the clinics of the insane asylums. In 1876 he founded the *Revue Philosophique*, of which he became the editor. In 1885 he gave a course of lectures in experimental psychology at the Sorbonne and in 1888 was appointed professor of experimental and comparative psychology in the Collège de France. Ribot was a leader in the development of psychology in France, selecting what was best in both English and German methods and results, while at the same time his work was characteristically French in breadth of view. Of special importance are his psychopathological studies and the analytical and comparative treatment of distinctive types or fields of mental phenomena in his later books. Many editions of his works have been published, and the most important of the latter have been translated into English. His writings include: *La psychologie anglaise contemporaine* (1870); *L'Hérédité psychologique* (1873); *Philosophie de Schopenhauer* (1874); *Psychologie allemande contemporaine* (1879); *Les maladies de la mémoire* (1881); *Les maladies de la volonté* (1883); *Les maladies de la personnalité* (1885); *La psychologie de l'attention* (1889); *Psychologie des sentiments* (1896); *L'Évolution des idées générales* (1897); *Essai sur l'imagination créatrice* (1900); *Essai sur les passions* (1906; 3rd ed., 1910); *Problèmes de psychologie affective* (1910); *La vie inconsciente et les mouvements* (1913).

**RICE.** Most of the principal rice producing countries in 1916 reported normal or good yields. The crop of India for 1915-16 was the highest on record as to both area and production, the yield being estimated at 32,877,000 tons, as against 27,242,000 tons the preceding year, or an increase of 21 per cent. In the United States the acreage, yield per acre, total production, and total value of crop exceeded those recorded for any previous year. Italy

and Egypt reported good yields, but in Egypt the acreage was much reduced as compared with previous years. The production of the United States was exceptionally large, amounting, as estimated by the Department of Agriculture, to 41,982,000 bushels on 878,800 acres, the average yield being 47.8 bushels per acre. All these figures constitute records. In 1915 the production was 28,947,000 bushels, the area 802,600 acres, and the average yield 36.1 bushels per acre. The average farm value on Dec. 1, 1916, was 88.6 cents per bushel and the total value of the crop on this basis \$37,186,000, a value never before reached. Rice was the only cereal with the bushel value lower on Dec. 1, 1916, than on Dec. 1, 1915, when its farm value was 90.6 cents. The leading States and their yields were as follows: Louisiana, 20,392,000 bushels; Texas, 10,575,000 bushels; Arkansas, 6,312,000 bushels; and California 4,543,000 bushels. The areas devoted to the crop in these States were respectively, 443,300, 235,000, 125,000, and 67,800 acres. South Carolina produced 49,000 bushels on 3500 acres. The other rice producing States were North Carolina, Georgia, Florida, Missouri, Alabama, and Mississippi. California practically doubled its acreage as compared with the preceding year.

**RICE, CALE YOUNG.** See LITERATURE, ENGLISH AND AMERICAN, *Poetry*, American.

**RICHARDS, THEODORE WILLIAM.** See ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE; CHEMISTRY, GENERAL.

**RICHTER, HANS.** An Austrian music conductor, died at Bayreuth Dec. 7, 1916. He was born in April, 1843, at Raab, Hungary, where his father was Kapellmeister. In 1853 he began his musical studies at the Vienna Conservatory, and in 1868, through the influence of Richard Wagner, he was appointed chorus master at the Munich Opera. In 1870 he conducted *Lohengrin* at Brussels, and in 1871-75 was Kapellmeister at the Budapest National Theatre. For several seasons he conducted the concerts of the Vienna Gesellschaft der Musikfreunde, and in 1876 conducted the Nibelungen performances at Bayreuth. He began the celebrated annual Richter concerts in London in 1877. In 1897 he settled in Manchester as conductor of the Symphony Orchestra, also conducting the Wagner performances at Covent Garden, London. In 1911 he returned to Vienna and retired through ill health. He was the most prominent Wagnerian conductor in Europe. Oxford gave him an honorary degree.

**RIDGE, W. PETT.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction*, English.

**RIGHT OF SEARCH.** See CONTRABAND OF WAR.

**RILEY, JAMES WHITCOMB.** An American poet, died at Indianapolis, Ind., July 22, 1916. He was identified all his life with Indiana, his native State, and in a peculiar way. Known as the "Hoosier poet," he was one of that group of writers in prose and verse, including besides himself Edward Eggleston, Meredith Nicholson, George Ade, and Booth Tarkington, who have made a name for Indiana as the literary centre of the Middle West. Even when, as for some time, he was resident in Chicago, contributing to the papers, his writing was largely in the dialect or vernacular with which he was familiar—that of the Indiana countryside. Like Eugene Field, whom he came to know in Chi-

cago, where both were members of the "Saints' and Sinners' Corner," an informal literary club, he will be best remembered for the homely, kindly verse that he wrote about children. It is said that in later life he rather depreciated his "dialect" poetry and wished to be remembered by more pretentious efforts, but he had found his place in the other field.

James Whitcomb Riley was born Oct. 7, 1853, at Greenfield, Ind. His father, a lawyer, wished him to follow the same profession, but he was averse to any calling that left so little personal freedom. His early ways of supporting himself were oddly varied. For a time he was a sign painter; then he identified himself with a company of players; he wrote jingling verse to advertise the wares of a patent medicine vendor, whom he accompanied on rural travels; he helped form a band of amateur musicians who traveled about playing, and incidentally painting advertisements; and he wrote rhymes for an Anderson paper on the products of that town. As a young man Riley gained wide notoriety in a way that he later regretted. To play a practical joke on a rival paper that had ridiculed his verse he wrote a clever imitation of a Poe poem and passed it off as genuine, a recent "find," under the title "Leonainie." Finally, of course, and with chagrin, he had to admit the hoax. It was under the pen-name of "Benj. F. Johnson, of Boone," that his early newspaper contributions appeared, as well as his first book, *The Old Swimmin' Hole and 'Leven More Poems* (1883). Much of his work appeared from time to time in the *Indianapolis Journal*. It gave him a reputation which gradually spread, attracting the notice of Longfellow and then of other literary men, till the time came when he was showered with honors. He was elected to the American Academy of Arts and Letters, received the gold medal of the National Institute of Arts and Letters, accepted honorary degrees from Yale, Wabash College, Indiana University, and the University of Pennsylvania, and in 1915 saw his birthday made a day of celebration throughout Indiana.

After his death his body lay in state in the capitol at Indianapolis. For many years Mr. Riley had made his home in this city, on the Lockerbie Street celebrated in his verse. He was unmarried. A biographical edition of his works in six volumes was published in 1913. Among the more familiar of his poems, the titles of which were often taken as the titles of collected verse, are: "The Old Swimmin' Hole," "An Old Sweetheart of Mine," "Orphant Annie," "The Raggedy Man," "Out to Old Aunt Mary's," "When the Frost is on the Punkin," and "Knee Deep in June." Consult Clara E. Laughlin, *Reminiscences of James Whitcomb Riley* (New York, 1916).

**RILEY, JOHN B.** See PENOLOGY.

**RINEHART, MARY ROBERTS.** See LITERATURE, ENGLISH AND AMERICAN, *Fiction and Travel, American*.

**RITTMAN PROCESS.** See CHEMISTRY, INDUSTRIAL.

**ROADS AND PAVEMENTS.** Vast sums continued to be provided for the surfacing of city streets and country roads to meet the increasing demands of traffic, particularly the wear and tear of motor vehicles of all sorts. No new street or road material established itself during the year. Granite block, asphalt, brick,

wood block, concrete with Portland cement and with bituminous binder, macadam, both water-bound and bituminous, but chiefly the latter, continued to be the main standby, with many variations in details. Heavier traffic needs and demands for better streets and roads are leading everywhere to a call for heavier, more durable, smoother, and more cleanly road and street surfaces.

Under a Federal-Aid Road Bill enacted by Congress, \$5,000,000 was made available for allotment to the several States for the year ending June 30, 1917, and thereafter increases of \$5,000,000 yearly until the sum of \$25,000,000 for 1921 is reached. The money was to be apportioned in thirds among the States in the ratios of their respective populations, areas, and mileages of rural mail delivery and star routes to the area, population, and mileage of the whole country. The grants were to be dependent upon the appropriation of like sums and the fulfillment of other conditions by the States, and the money was to be expended under the supervision of the United States Office of Public Roads and Rural Engineering. The 1916-17 allotments after deducting 3 per cent for Federal supervision are shown by the accompanying table. The bill also appropriated \$1,000,000 a year "for the survey, construction, and maintenance of roads and trails within or partly within the national forests."

STATE ROAD WORK continued unabated. California, to name only one example, voted \$15,000,000 additional bonds for highway improvements. The total vote and the majority were each much larger than for the \$18,000,000 road bond issue authorized a few years ago. County Road Bond issues ranging from a few hundred thousand to millions of dollars were on the increase. After a successful bond campaign, Vermillion County, Illinois (Danville is the county seat), began to build 170 miles of improved roads in 1916. The work was carefully planned for rapid execution in two working seasons. Competition for the contracts was keen, 135 bids having been received from contractors located in all parts of the country. For one section alone, 23 separate bids were put in. The county supplies the cement for the work. There were to be 150 miles of concrete, and 20

miles of brick laid directly on a concrete foundation before the latter had set—"monolithic brick pavement." P. C. McArdle, Danville, Ill., was the supervising engineer. (See *Engineering News*, Aug. 10, 1916, for details.) In Missouri, St. Louis County was to spend a \$3,000,000 bond issue for road improvement, the validity of the bonds having been established towards the close of the year. That all road funds were not being spent under proper engineering supervision was illustrated by the fact that one western county had entrusted the direction of the work to a \$4-a-day superintendent.

**LINCOLN HIGHWAY.** Progress continued on the Lincoln Highway, a through route from New York to San Francisco, being promoted by the Lincoln Highway Association. The character of the improvements ranged from brick and concrete through various classes of macadam to the mere shaping up of dirt roads. "Seedling miles" were put down here and there to beget other miles by the force of good example. Bridges were being strengthened. In Pennsylvania an effort was being made to eliminate toll roads—this being the only State on the route that had not left toll roads behind. The bulk of the improvements were made at public expense, but manufacturers interested in the sale of road materials have contributed supplies for some of the "seedling miles."

**SCENIC HIGHWAYS** continued to be built. A notable addition was the Twin Peaks Boulevard, San Francisco, commanding a fine view of that city and its vicinity. The Pike's Peak Motor Highway, Colorado, was opened on July 22nd. It is from 20 to 50 feet wide, has a maximum grade of 12½ per cent, and a summit elevation of 14,109 feet—said to be the highest automobile roadway of its class in the world. It will be used for automobile climbing contests.

**CONCRETE** road surfaces were being extended in various parts of the United States. An eight-mile stretch of such road between Easton and Bethlehem, Pa., was opened with official flourishes on November 2nd by Governor Brumbaugh and representatives of the William Penn Highway Association and the Portland Cement Association. It was expected that the improvement would be extended from Bethlehem to Allentown in 1917. Some 150 miles of concrete roads were contracted for by Vermillion County, Ill. (mentioned elsewhere in this article). Other localities noted for concrete roadways are Wayne County, Mich., and Sioux City, Iowa. The concrete on the roadways mentioned is made with Portland cement as a binder. In various other localities asphaltic concrete had been and was being used and in some places Portland cement concrete was surfaced with asphalt.

**BRICK.** Small brick cubes for resurfacing worn macadam were laid for trial in Monroe County, N. Y. (J. Y. McClintock, County Engineer, Rochester, N. Y.). The cubes were 2¼ inches on a side and weighed about a pound each. The old macadam was brought up to the proper crown with sand. The cubes were laid out on a pallet, the latter was placed on the sand surface, and pulled from under the cubes. The cubes were then tapped with a hammer and covered lightly with sand. The cost of the resurfacing was \$12,000 a mile for a roadway 12 feet wide. The use of brick cubes followed an experiment with 2-inch concrete cubes begun a

half dozen years earlier in Monroe County. These were not wholly satisfactory, perhaps because the concrete was not strong enough.

**DAMAGE.** An extreme illustration of the damage to roads and pavements by too heavy motor vehicles was afforded on 42nd Street, New York City, where heavy granite blocks, recently laid, were crushed and their tops powdered by motor trucks loaded with stone from the excavation for the new subways. The loads were abnormal, running as high as 19 tons each, but damage of less though serious degree was occurring on city pavements and improved roads throughout the country, showing the need of firm and intelligent control of the use of highways by motor trucks. Both New York and New Jersey had drastic legislation on this subject under consideration at the close of 1916. See **AUTOMOBILES; UNITED STATES DEPARTMENT OF AGRICULTURE.**

**Bibliography.** Among the new books of the year were: T. R. Agg, *Construction of Roads and Pavements* (New York); A. H. Blanchard, *Elements of Highway Engineering* (New York); J. I. Tucker, *The American Road* (Norman, Okla.).

**ROBERTSON, AGNES** (MRS. DION BOUCICAULT). A British actress, died in London Nov. 6, 1916. She was born in Edinburgh in 1833, the daughter of Thomas Robertson, an art publisher, and made her first stage appearance when 10 years old. Later she appeared with Fanny Kemble and Macready. Going to London she made a reputation for herself in Taylor's *Our Clerks* and other comedies at the Princess's Theatre, married Dion Boucicault in 1853, and came with him to America. Returning to London in 1860, she played successively at the Adelphi, Drury Lane, and other theatres, taking leading parts in several of her husband's dramas, notably as Eily O'Connor in *The Colleen Bawn* (1860), Zoe in *The Octoroon* (1861), and Jane Learoyd in *The Long Strike* (1886). For a time she again lived in America, but in her later life was separated from her husband.

**ROBERTSON, SIR GEORGE SCOTT.** A British soldier, died Jan. 3, 1916, in London. He was born in London in 1852, and after studying at the Westminster Hospital Medical School entered the Indian Medical Service, and served through the Afghan campaign of 1879-80. Afterward he was in the employ of the Indian Foreign Office. He became famous in 1895 when, having reached Chitral on a political mission, he met hostility, and with only 543 men, was besieged in the fortress for six weeks during March and April. Robertson himself was severely wounded before Colonel Kelley was able to come to his relief. For his great service he was made a K.C.S.I. He was distinguished also as a geographer. From 1906 he had represented Central Bradford in Parliament. He published *The Kafirs of the Hindu Kush* (1896) and *Chitral: the Story of a Minor Siege* (1898).

**ROBLINSON, EDWARD ARLINGTON.** See **LITERATURE, ENGLISH AND AMERICAN, Poetry, American.**

**ROCHESTER, UNIVERSITY OF.** A non-sectarian institution at Rochester, N. Y., founded in 1850 for the education of men. There is now a woman's college as part of the university. In the several departments in the fall of 1916 there were 555 students. The faculty numbered 46. During the year Dr. Edwin Fauver was

appointed professor of hygiene and physical education. By a bequest of Lewis P. Roas the university received, in conjunction with the Mechanics Institute, a gift of about \$1,000,000 to found a department of vital economics. On July 1st the productive funds of the institution amounted to \$1,666,177 and during the year 1915-16 it drew an income from these funds of \$84,987. The library contains 72,000 volumes. President, Rush Rhees.

**ROCKEFELLER FOUNDATION.** See ROCKEFELLER PHILANTHROPIC BOARDS.

**ROCKEFELLER INSTITUTE.** See ROCKEFELLER PHILANTHROPIC BOARDS.

**ROCKEFELLER PHILANTHROPIC BOARDS.** ROCKEFELLER INSTITUTE. The various boards established by John D. Rockefeller include the Rockefeller Institute for Medical Research founded in 1901. It has three main departments: the laboratories devoted to investigations in pathology, bacteriology, chemistry, physiology, experimental surgery, and experimental biology; a hospital for special clinical studies; and a department of animal pathology on a farm near Princeton, N. J., to which the Rockefeller Foundation recently apportioned \$1,000,000. In the fiscal year ended June 30, 1916, the institute had total endowment and property valued at \$14,307,854 and reported disbursements of \$507,985.

**GENERAL EDUCATION BOARD.** The General Education Board was chartered by act of Congress in 1903, for "the promotion of education within the United States of America without distinction of race, sex, or creed." It has undertaken to promote practical farming in the Southern States, thus having expended \$940,116; the development of high schools in those same States, thus appropriating \$308,990; the promotion of higher education throughout the United States, having given \$12,435,760 to institutions raising in addition \$46,903,000; the advancement of negro education, to which it has given \$1,123,180; the promotion of medical education, by gifts aggregating \$2,920,874 to the medical schools of Johns Hopkins, Washington University of St. Louis, and Yale University. It has also given \$118,959 for the stimulation of rural education in 11 States; and \$96,493 for educational investigation, research, and experiment. See UNIVERSITIES AND COLLEGES.

**ROCKEFELLER FOUNDATION.** The Rockefeller Foundation, chartered in New York State in 1913 "to promote the well-being of mankind throughout the world," is the most extensive of all these philanthropies. Its endowment Dec. 31, 1915, amounted to \$101,751,749. During 1915 its disbursements amounted to \$14,715,664. Among the objects of its assistance have been the following: the purchase of a tract in Louisiana as a bird refuge; the American Red Cross; the American Academy in Rome; the Annual Foreign Missions Conference of North America; the American Association for the Conservation of Vision; New York Association for Improving the Condition of the Poor; the National Committee for Mental Hygiene; the New York Bureau of Municipal Research; the Colorado State Committee on Unemployment and Relief; the Rockefeller Institute for Medical Research; Johns Hopkins University for the establishment of a School of Hygiene and Public Health; the New York Mayor's Committee on Infantile Paralysis.

The International Health Board was established by the foregoing Foundation in 1913 for the promotion of health throughout the world. Its expenditures in 1915 were \$441,301. It has undertaken the relief and control of uncinariasis or the hookworm disease, the control of yellow fever, and of malaria, wherever found. The China Medical Board was established by the Rockefeller Foundation in 1914 for the purpose of promoting scientific medicine and hygiene in China. It expended in 1915, \$157,623 in aiding medical schools, hospitals, and training schools for nurses. To it the Foundation recently apportioned \$125,000 for a building site. Another undertaking of the Foundation is the investigation of industrial relations under the direction of W. L. Mackenzie King, for which \$19,509 was expended in 1915.

The War Relief Commission was established by the Foundation in 1914 for the study and relief of non-combatant victims of the European war. Its disbursements to Oct. 1, 1916, amounted to \$3,232,043. In October, 1914, this commission went to Europe and began a survey of relief activities in Belgium, Holland, Poland, Serbia, Montenegro, Turkey, and Italy. In consequence it has expended nearly \$1,000,000 for relief work in Belgium, not including the support of Belgian refugees in Holland, England, and Switzerland. It undertook extensive sanitation and relief work in Serbia; expended \$360,000 for relief work in Turkey, Persia, and the Caucasus; gave \$260,000 for the work of the International Committee of the Y. M. C. A. in European prison camps; provided Dr. Alexis Carrel with funds for medical research in a military hospital on the western war front; appropriated on May 24, 1916, \$1,000,000 for relief work in Poland, Serbia, Montenegro, and Albania. (See RELIEF FOR WAR VICTIMS.) In December George E. Vincent, president of the University of Minnesota, accepted the presidency of the Rockefeller Foundation, succeeding John D. Rockefeller, Jr. He stipulated that his salary should remain the same as in his previous position, \$10,000 per year, thus signifying that he made the change only because of the opportunity for larger service.

#### **ROCKY MOUNTAIN SPOTTED FEVER.**

Progress was made in our knowledge of this important disease by the finding of certain bodies in the blood of human beings, white rats, and guinea pigs, suffering from Rocky Mountain spotted fever, by L. D. Fricks, a surgeon in the United States Public Health Service. These bodies he describes as small extra-corpuseular granules, straining bright red and highly refractile, which may be surrounded by a pale halo, and found within or very close to the red blood corpuscles. These granules were most numerous in and around the endothelial cells from the smaller blood vessels, and Fricks believes them to have a causative relation to the disease.

The ticks that convey Rocky Mountain spotted fever pass the earlier cycles of development on chipmunks, ground squirrels, and other small animals, migrating later to horses and cows. The fact that such rodents may serve as hosts for these ticks reduces the efficiency of dipping of horses and cows as a means for the eradication of the ticks. The availability of dipping is further limited by the relatively small area that any one dipping tank can serve, and the

cost of constructing and operating large numbers of such tanks. The use of sheep as an agency for the freeing of tick-infested areas from such infestation was pointed out by Dr. Fricks. Ticks find their way readily into the wool of the sheep as they graze, and in the wool the ticks die or are at least carried forward as the sheep move. The grazing of the sheep from inhabited areas onward to uninhabited mountainous regions would tend toward the destruction of the ticks or the carrying of them to places where they could do comparatively little harm to human beings.

**RODMAN, WILLIAM LOUIS.** An American surgeon, died March 8, 1916, in Philadelphia. He was born at Frankfort, Ky., in 1858 and after graduating from Jefferson Medical College, Philadelphia, in 1879, and serving a year as hospital house surgeon, was from 1880 to 1882 a surgeon in the United States army. From 1885 to 1893 he was connected with the medical department of the University of Louisville, then until 1898 was professor at the Kentucky School of Medicine, and thereafter till his death held the chair of surgery at the Medico-Chirurgical College of Philadelphia. From 1900 he also served as a professor in the Woman's Medical College of the same city. Especially noted for his contributions to the treatment of cancer, Dr. Rodman was elected president of the American Medical College Association in 1902, and of the American Medical Association in 1915, and became a member of and prominent in various other professional societies. He was instrumental in having the National Board of Examiners established. His writings were contributed to surgical journals.

**ROENTGEN RAYS,** or X-RAYS. See PHYSICS.

**ROMAN CATHOLIC CHURCH.** During the year the great war again impeded the orderly administration of the usual details of the intercourse between the Vatican and the various divisions of the Church's establishment throughout the world. Pope Benedict XV was unremitting in his efforts to restore peace. He made a special appeal in a notable letter addressed, on March 4th, to Cardinal Pompili, Vicar of Rome, and inaugurated several movements for the amelioration of the condition of prisoners of war and for the aid of the wounded of all nations and of the starving non-combatants in Poland and Belgium. See WAR OF THE NATIONS.

An important consistory was held by the Pope on December 4th, at which, in his allocution, he announced the completion of the revised Code of Canon Law, which will now be published in five volumes for general distribution throughout the world. The credit for the new Code, the Pope said, was due to his predecessor, Pius X. He also paid a fine and well-deserved tribute to Cardinal Gasparri, Papal Secretary of State, who bore the brunt of the work. Cardinal Gasparri was appointed Camerlengo of the Church, in succession to the late Cardinal della Volpe.

Referring in his address to the present war the Holy Father said:

"It is well to recall, aside from the laws of God, that if even the law of man was obeyed at present, peace and prosperity would reign in Europe. If we neglect or disdain laws and authority, discord is the sure result. This is the highest social law. As a result of ignoring this law we see every principle of right violated

in Europe. . . . I cannot but deplore again these crimes."

The Pope concluded his remarks with the prayer that, as the new Code of Canon Law would mark a more tranquil epoch for the Church, so also the time might come when the spirit of law might again be respected in the world and bring harmony and prosperity to the nations.

The following prelates were then raised to the rank of cardinal: Peter La Fontaine, Patriarch of Venice; Donatus Sbarretti, Assessor of the Holy Office; August Dubourg, Archbishop of Rennes; Louis Ernest Dubois, Archbishop of Rouen; Vittorio Amedeo Ranuzzi de Bianchi, Majordomo of His Holiness; Thomas Pius Boggiani, O. P., Assessor of the Sacred Consistorial Congregation; Alessio Ascalesi, Archbishop of Beneventum; Louis Joseph Maurin, Archbishop-elect of Lyons; Nicholas Marine, Secretary of the Apostolic Segnatura; Orestes Giorgi, Secretary of the Congregation of the Council. The new cardinals average less than 60 years of age, and the Archbishop of Beneventum is only 42. Italy now has 35 cardinals, France 8, Spain 5, and Austria-Hungary 4. Germany and the United States have three each, England and Portugal two each, and Holland, Belgium, Ireland, South America, and Canada one each. Twenty-nine of the 68 cardinals will reside in Rome. Two others, who, rumor says, are the Archbishops of Prague and of Breslau, were reserved *in pectore*. The best known in America of the new cardinals is Donatus Sbarretti, for many years Auditor of the Apostolic Delegation at Washington and later Apostolic Delegate to Cuba and to Canada. No Germans or Austrians were present at this consistory, and none of the new cardinals are of those nationalities. The number of Frenchmen given the red hat was taken as an indication of renewed friendliness between the Papal Court and France.

An important action of the Pope was the ordering, in November, through the Consistorial Congregation of Cardinals, of a new procedure in the method of selecting future bishops for the United States. This act abolishes the old system of the submission of a "terna" of names, chosen by the irremovable rectors, after the death of a bishop, to the bishops of the ecclesiastical province, and in its stead establishes a system of private inquiry by the bishops of each province for the purpose of selecting suitable priests whose names are to be secretly balloted for at a meeting of the bishops held under the presidency of the Archbishop; and the names of those thus chosen are to be forwarded to Rome, so that the Pope can make a selection and an appointment immediately, avoiding in this way the delay which is declared to be the principal reason for changing the present procedure. A special feature of the new system is the strict secrecy *sub gravi* enjoined throughout the inquiry and selection of the three names by the bishops. The Pope, in a letter to the hierarchy of Canada, directed a peaceful settlement of the much vexed dispute over the dual language question in the Catholic schools of the Dominion. Another act announces the introduction of the cause of beatification of Father Isaac Jogues, the first priest to visit New York, John de Brebeuf, Gabriel Lalemand, Anthony Daniel, Charles Garnier, Noel Chabanel, René Goupil, and John

de la Lande, Jesuit missionaries in Canada and the Northwest who were martyred by the Indians.

Two cardinals died during the year, Gotti (q.v.), Prefect of the Propaganda, and della Volpe (see NECROLOGY), Prefect of the Index. There were eight deaths among the American hierarchy: Archbishop J. L. Spalding (q.v.), former Bishop of Peoria; Bishop Doran, auxiliary of Providence, January 10th; Bishop J. W. Shanahan, of Harrisburg, February 19th; Bishop Thomas Brennan, formerly of Dallas, in Rome, March 21st; Bishop Soter Artynsky (q.v.), head of the Ruthenian Greek Catholics; Bishop Harry P. Northrop, of Charleston, S. C., June 8th; and Bishop Henry J. Richter, of Grand Rapids, Mich., December 26th. Prominent laymen among the dead of the year were: Dr. Charles George Herbermann (q.v.), editor-in-chief of the Catholic Encyclopedia; and Thomas M. Mulry (q.v.), president-general of the St. Vincent de Paul Society.

Other changes among the hierarchy were the transfer of Archbishop Harty of Manila to be Bishop of Omaha, and of Bishop John J. Lawler, auxiliary of St. Paul, to be Bishop of Lead, S. Dak. Bishop M. J. O'Doherty of Zamboango, P. I., was made Archbishop of Manila; Mgr. Philip R. McDevitt, of Philadelphia, was appointed Bishop of Harrisburg, and Mgr. William T. Russell, of Washington, D. C., Bishop of Charleston, S. C.; Auxiliary Bishop M. J. Gallagher became Bishop of Grand Rapids, Mich.; and Bishop McCort, of Philadelphia, was appointed Bishop of Los Angeles but declined the transfer. "Catholic Week," August 20th-24th, drew to New York hundreds of delegates from societies all over the country to attend the national convention of the American Federation of Catholic Societies, the German Central Verein, the Young Men's Catholic Union, and the Catholic Press Association.

The joint conventions were opened with Pontifical High Mass in St. Patrick's Cathedral, Sunday, August 20th. At this Mass Cardinals Gibbons, Farley, and O'Connell, and the Apostolic Delegate, Archbishop Bonzano, as well as many other prominent prelates, were present. It was followed by an immense meeting at Madison Square Garden at which Governor Whitman, Acting-Mayor Dowling, the Apostolic Delegate, and the three cardinals all spoke. The feature of the occasion was the speech of Cardinal O'Connell defending the loyalty of Catholics to the principles of their American citizenship. The National Convention of the Knights of Columbus was held at Davenport, Iowa, August 2nd and 3rd, and the International Federation of Catholic Alumnae met at Baltimore, November 23rd-25th. See MINIMUM WAGE.

**STATISTICS.** According to the estimates made for the *Official Catholic Directory* there are 16,564,100 Catholics in continental United States. If to these the Catholics of the island possessions be added there are 24,922,062 Catholics under the United States flag. In the United States proper there are 16,564,109; in the Philippines there are 7,285,458. The additional 1,072,495 are in Alaska, the Canal Zone, in Guam, in American Samoa, in the Hawaiian Islands, and in Porto Rico. The *Directory* states that there are 19,572 Catholic clergymen in the United States. Of these, 14,318 are secular clergy, while 5254 are members of religious orders.

The publication also lists: 10,058 Catholic churches with resident priests; 5105 mission churches; 85 seminaries with 6201 students studying for the priesthood; 112 homes for aged; 210 colleges for boys; 685 academies for girls; 5588 parochial schools, in which there are enrolled 1,497,949 children; and 283 orphan asylums with 48,089 orphans. Further figures show that the 26 States having a Catholic population of over 100,000 are: New York, 2,899,223; Pennsylvania, 1,802,977; Illinois, 1,479,291; Massachusetts, 1,400,834; Ohio, 903,102; Michigan, 597,000; New Jersey, 593,000; Louisiana, 586,400; Wisconsin, 577,823; California, 518,163; Missouri, 490,000; Minnesota, 470,361; Connecticut, 469,701; Texas, 412,190; Rhode Island, 275,000; Maryland, 261,000; Iowa, 257,400; Indiana, 249,426; Kentucky, 171,871; New Mexico, 140,573; New Hampshire, 134,000; Maine, 131,638; Kansas, 126,980; Nebraska, 120,761; Colorado, 110,384; North Dakota, 103,471.

**ROVE TUNNEL.** See CANALS, *Marseilles-Rhône Canal*; TUNNELS.

**ROWING.** The United States again had a monopoly in the rowing world in 1916, the historic Henley Regatta of England having been abandoned for the second year in succession on account of the war. The victory of the Syracuse University varsity eight in the intercollegiate regatta on the Hudson was the noteworthy feature of the rowing season. This crew, coached by James Ten Eyck, was, in the opinion of experts, the most formidable aggregation of oarsmen that has ever been turned out by an American college.

Harvard obtained revenge for the defeat suffered at the hands of Yale in the preceding year by making a clean sweep of the races contested on the Thames.

Amateur rowing proved popular, the entry list for the annual regatta at Duluth, Minn., being the largest ever received. Tom Rooney of the Ravenswood Boat Club, Flushing, L. I., distinguished himself by capturing the national singles title after a thrilling race with John B. Kelly of the Vesper Boat Club of Philadelphia. Robert Dibble of the Don Rowing Club of Toronto, Canada, holder of the title, was unable to compete, owing to his enlistment in the British army.

The times made by the various eight-oared varsity crews in the intercollegiate regatta on the Hudson were: Syracuse, 20 minutes, 15 seconds; Cornell, 20:22%; Columbia, 20:41%; Pennsylvania, 20:62%.

Syracuse also carried off the honors in the junior eight-oared race, covering the 2 miles in 11 minutes, 15% seconds. The times for the other crews were: Cornell, 11:20%; Columbia, 11:32; Pennsylvania, 12:06%.

The freshmen eight-oared race at 2 miles was captured by Cornell, whose time was 11 minutes, 5% seconds. The other crews finished

as follows: Syracuse, 11:15%; Pennsylvania, 11:16%; Columbia, 11:23%.

Harvard, in triumphing over Yale at New London, went over the 4-mile course in 20 minutes, 2 seconds. Yale's time was 20:17. The Crimson oarsmen also captured the second varsity eight-oared event, the time being 10 minutes, 25 seconds, as against Yale's 10:27. The freshmen from Cambridge followed in the wake of their elders by winning their race with the Eli youngsters. The times were: Harvard, 10 minutes, 36% seconds, Yale, 10:39.

In college dual and triangular meets during 1916 Harvard defeated Cornell; Princeton defeated Harvard; Pennsylvania defeated Yale; Leland Stanford defeated California; Washington defeated Leland Stanford; Navy defeated Pennsylvania; Princeton defeated Navy, Columbia, and Pennsylvania; Cornell defeated Princeton.

The 44th annual championships of the National Association of Amateur Oarsmen were held at Duluth, Minn. The Duluth Boat Club, for the second successive year, carried off the majority of the laurels. The winners in the more important events were: Junior eight-oared shells, Duluth B. C.; senior eight-oared shells, Duluth B. C.; intermediate eight-oared shells, Duluth B. C.; senior sculls, Tom Rooney; intermediate sculls, E. Henkel; association sculls, Tom Rooney.

The 13th annual regatta of the American Rowing Association, popularly known as the American Henley, was held at Philadelphia. The winners of the principal events were: Eight-oared shells for Childs Cup, Princeton; junior collegiate eight-oared shells, Syracuse; freshmen eight-oared shells, Yale; first single sculls, John B. Kelly; interscholastic eight-oared shells, Central High School, Philadelphia.

**ROYCE, JOSIAH.** An American philosopher, died at Cambridge, Mass., Sept. 14, 1916. He was born in Grass Valley, Nevada County, Cal., Nov. 20, 1855, graduated at the University of California in 1875, studied at Leipzig, Göttingen, and Johns Hopkins (Ph.D., 1878), and in 1878 was appointed instructor in English in the University of California. He became instructor in philosophy at Harvard University in 1882, assistant professor there in 1885, professor of the history of philosophy in 1892, and in March, 1914, Alford professor of natural religion, moral philosophy, and civil polity. His earlier writings, not in philosophy, include: *A Primer of Logical Analysis, for the Use of Composition Students* (1881); *California from the Conquest in 1846 to the Second Vigilance Committee in San Francisco* (1886); *The Feud of Oakfield Creek* (1887), a novel. His philosophical and later publications are: *The Religious Aspect of Philosophy* (1885); *The Spirit of Modern Philosophy* (1892); *The Conception of God* (1897), jointly; *Studies of Good and Evil* (1898); *The Conception of Immortality* (1900); *The World and the Individual* (2 vols., 1900-01), the Gifford lectures at Aberdeen University; *Psychology* (1903); *Herbert Spencer: An Estimate and a Review* (1904); *The Relation of the Principles of Logic to the Foundations of Geometry*, in the *Transactions of the American Mathematical Society*, July, 1905; *Philosophy of Loyalty* (1908); *Race Questions, Provincialism, and Other American Problems* (1908); *William James and Other Essays on the Philosophy of*

*Life* (1911); *Sources of Religious Insight* (1912); *The Problem of Christianity* (2 vols., 1913); *War and Insurance* (1914); *The Hope of the Great Community* (posthumous, 1917).

In metaphysics Royce won international recognition as one of the ablest exponents of absolute idealism, with emphasis laid on individuality, both finite and infinite, and on will rather than on intellect. The foremost opponent of pragmatism and the new realism, and of the English empiricism from which they are derived, he was vigorously criticised by adherents of those systems, but defended his position with a vigor and wealth of thought rarely exceeded. The moral issues raised by the outbreak of the European war strongly moved him to state his views in several public addresses. Professor Royce served as president of the American Philosophical Association and of the American Psychological Association (1901). He was also elected a member of the National Academy of Sciences and of the National Institute of Arts and Letters and a fellow of the American Academy of Arts and Sciences. Yale, Johns Hopkins, Harvard, Aberdeen, St. Andrews, and Oxford gave him honorary degrees. Consult G. H. Howison, *Josiah Royce* (1916).

**RUBBER.** The year 1916 was in every way remarkable in the rubber industry, all the way from the production of crude rubber to the manufacture of various articles which long since had become indispensable in the daily economy of the world. The mere manufacture of tires for motor vehicles by American factories required practically one-half the world's production of crude rubber, but in other fields the demand increased, and more and more European nations were dependent upon American manufactures, especially under the unusual conditions brought about by the war.

The world's production of crude rubber in 1916 was estimated at between 178,000 and 198,000 tons, or an increase of from 32,000 to 52,000 tons over 1915, when the production was placed at 146,000 tons. This greater production was due largely to increased yield from the plantations of the Far East, as in 1916 about 75 per cent of the grand total amount came from these regions, which as recently as 1905 supplied but 145 tons as compared with between 140,000 and 150,000 in 1916, with a constantly increasing acreage and yield per acre. This increased production by special arrangement with the British government on the part of American rubber manufacturers was largely available in the United States, and in 1916 such imports amounting in value to some \$125,000,000 served to influence American exchange to the benefit of Great Britain. These imports began to come in considerable amounts to the Pacific coast, thus avoiding the war zones and the perils of submarines.

The total production of crude rubber in 1916 as estimated by the *India Rubber World* (New York), along with the production of the two previous years, is given in the accompanying table:

WORLD'S PRODUCTION OF CRUDE RUBBER

	1916	1915	1914
Ceylon and India, . . . . . tons	24,500	20,800	14,800
Malaya, etc. . . . .	105,500	72,800	49,700
Amazonas (Brazil, Bolivia, and Peru) . . . . .	28,255	80,700	28,345

	1916	1915	1914
Peruvian and Caucho .....	8,245	6,800	8,655
West Coast, Africa.....	2,000	2,500	2,650
Benguela and Mossamedes..		1,900	1,500
Loanda .....		600	450
Congo, French Congo and Sudan .....	5,000	3,000	3,900
From other sources .....	4,500	7,100	10,380
<b>Totals .....</b>	<b>178,000</b>	<b>146,000</b>	<b>120,880</b>

These statistics show that the production of South American rubber was somewhat increased, although including more Caucho ball and less *Mawicoba* and Assare. Practically all the Amazon rubber was consumed in 1916. Central America exported very little and almost no guayule.

Increased amounts were received from Congo, French Congo, and Sudan, but very little was received from East Africa and Madagascar. Penang increased its supply of wild rubber twofold, while Sumatra, Java, and Borneo exported less Rambong rubber but more *Hevea*. The production of jelutong and balata decreased considerably.

It should be borne in mind in considering statistics for rubber production that the rubber ton is 2240 pounds avoirdupois and figures for wild rubber are of different significance from those for plantation rubber. With the former there is a loss in washing and drying equal to 20 per cent of a fine Para rubber and 30 per cent for all other wild rubbers. In the case of plantation rubbers the figures refer to washed and dried rubber, and the same consideration applies where price quotations are given, this circumstance accounting in large part for the difference. Making allowance, therefore, for the essential difference in the two main classes of crude rubber, the figures given above are of interest for purposes of comparison and indicating the total production on the basis of careful estimates.

As stated above, there was increased yield of plantation rubber in the Far East, due not only to greater plantation acreages, but chiefly to increased yields per acre.

The accompanying estimates indicate the acreage of the various colonies for the years 1914, 1915, and 1916.

	1916	1915	1914
Ceylon .....	230,000	230,000	220,000
Malaya, Malacca .....	600,000	550,000	500,000
Borneo .....	30,000	20,000	20,000
Dutch East Indies, Java, Sumatra, etc. ....	500,000	450,000	400,000
India and Burma .....	40,000	40,000	65,000
German colonies, Samoa, East and West Africa.	12,000	12,000	40,000
<b>Totals .....</b>	<b>1,412,000</b>	<b>1,302,000</b>	<b>1,245,000</b>

The plantations, chiefly of *Castilloa*, in Mexico, West Indies, and Central and South America in 1916 showed no progress and the yields were insignificant. The same was true of Ceara plantations in East Africa.

The price of crude rubber in New York varied from high records of \$1.05 per pound for First latex crepe spot and \$1.00 Upriver fine spot in January, to low levels in June and July with a gradual increase to 78 cents at the end of the year for Upriver fine and 79 cents for First latex. Average prices for Upriver and Islands rubber and Cameta for the years 1911 to 1916 were:

	Upriver		Islands		Cameta
	Fine	Coarse	Fine	Coarse	
1916 .....	\$0.74	\$0.50	\$0.66	\$0.38	\$0.35
1915 .....	.61%	.47%	.55%	.30%	.33%
1914 .....	.73%	.47%	.68%	.31%	.35%
1913 .....	.87%	.58%	.79%	.36%	.42%
1912 .....	1.11%	.89%	1.05%	.59%	.68%
1911 .....	1.18%	.95%	1.10%	.64%	.70%

The consumption of crude rubber of the various grades was estimated as follows by the *India Rubber World*:

	1916	1915	1914
England .....	25,000	24,000	18,000
Germany, Austria, etc. ....	1,500	3,000	16,480
France .....	8,500	7,000	5,000
Russia .....	20,000	16,000	11,610
Italy, etc. ....	4,000	2,500	4,000
Japan and Australia.....	5,000	4,000	2,400
America and Canada .....	114,000	89,500	62,940
<b>Totals .....</b>	<b>178,000</b>	<b>146,000</b>	<b>120,880</b>

All countries reported increased consumption except the Teutonic nations, from whom supplies were largely cut off, the United States, Russia, and Italy being most conspicuous. Scandinavian countries and Spain were manifesting increased activity in the rubber industry.

On the technical side there were continued advances in rubber manufactures due to the great activity of the chemists of the industry. Improved methods of analysis were being developed as well as aging tests, while by the use of various chemicals for accelerators, the time required for vulcanization was decreased by at least one-half and the amount of production correspondingly doubled. For the dry heater a method of pressure curing was substituted in the manufacture of footwear and was thought to be applicable with advantage to other branches of the industry, such as the manufacture of clothing, mackintoshes, and carriage cloth. With the high prices and shortage of sole leather there was developed commercially a combined rubber and fibre or leather sole for which a wide application seemed promised. In vulcanization cold methods were being improved and a process of hot vulcanization without the use of sulphur was announced from Russia as a recent discovery with possibilities. Little progress was made during 1916 with synthetic rubber either in Germany or the United States; high cost being a leading obstacle of the methods already developed and, especially in America, the activity of competent chemists was being turned to more useful fields.

While the rubber industry was active in all fields in the United States, the growth in the manufacture of automobile tires was phenomenal, having to keep pace as it did with the large number of automobiles (q.v.). In addition, the export business had grown by leaps and bounds and the total United States exports of motor tires for the years ended June 30 were as follows:

1914 .....	\$ 3,505,267
1915 .....	4,963,270
1916 .....	17,938,227

The calendar year 1916 was expected to show an even greater gain, as the eight months ending August, 1916, had exports practically double those of the corresponding period in 1915. Naturally much of the rubber exported was in

the form of other war material as well as tires. Rubberized fabrics for army equipment and aeroplanes were in demand, while more than ever before was rubber employed in surgery to replace broken bones or features around which skin could be grafted, or used for artificial limb construction. In conclusion it might be said that American enterprise was reaching out into the Far East to acquire land or plantation for rubber cultivation in Malaya and elsewhere, and this tendency was being looked at with feelings of hostility by many British planters. See CHEMISTRY, INDUSTRIAL.

**RUBBER, ARTIFICIAL.** See CHEMISTRY, INDUSTRIAL.

**RUBY.** See MINERALOGY.

**RUMANIA.** A constitutional European monarchy, hereditary in the male line of Charles I of the house of Hohenzollern. It is composed of the former principalities of Moldavia and Wallachia, with the territory of the Dobruja and, as a result of the wars in the Balkans, a strip of territory acquired from Bulgaria, between the Danube and the Black Sea. Bucharest, the capital, was abandoned by the Rumanian government Nov. 27, 1916, which moved to Jassy on this date. Bucharest, the old Wallachian capital (next to Paris the largest fortress in the world), was made the capital of the new nation which was formed in 1861 by the union of Wallachia and Moldavia. Jassy was the capital of Moldavia and was to receive a sum equivalent to \$700,000 in return for her lost prestige; but the money was never paid. The population (1914 estimate) of Bucharest was given at 345,628 and that of Jassy at 76,120. Bucharest was taken by the Germans Dec. 6, 1916. Area and population according to the census of 1913 were 137,907 square miles and 7,509,009.

Rumania is not a Balkan state, and took no part in the operations of the Balkan League (Bulgaria, Serbia, Montenegro, and Greece) against the Ottoman Empire in 1912-13; but during the second war (1913), when Bulgaria was in opposition to the remaining members of the League, Rumania was able to extract terms from Bulgaria at the Treaty of Bucharest, by which a "quadrilateral" of Bulgarian territory, amounting to 7609 square miles, with a population of 285,000, was surrendered to Rumania. Principal towns, Siljstria and Dobritsi. Population (1914) of Galatz, 72,512; Braila, 65,911; Ploeshti, 57,376; Craiova, 51,877; Botoshani, 32,874; Buzau, 29,483; Constantza, 27,662; Berlad, 25,367.

The surplus of births over deaths in 1914 was 144,396; in 1913, 117,936; 1912, 148,474; 1910, 100,263.

**PRODUCTION.** The grain-growing Wallachian district was at the end of 1916 largely overrun by the German invaders. As outlet to the sea has been blocked since the beginning of the European war, enormous quantities of grain intended for export must have been stored; for Rumania is, after Russia, the most considerable grain exporter in the eastern hemisphere. It has been reported from Bucharest that the retreating Rumanian armies set fire to all stores along their line of march. German reports contradicting the efficacy of these measures assert the capture of great quantities of both grain and oil. The main seat of the petroleum industry (in which was invested a large amount of German capital) is in the mountains northwest of

Bucharest. If the Rumanians succeeded in blowing up the works and setting the wells on fire over a considerable territory, a prime object of Germany in the invasion of the country will have been defeated. If, on the contrary, time was lacking in which to destroy the stores, Germany will have gained quantities of oil to operate her Diesel engines and gasoline motors, grain to stop the many mouths of German hunger, cattle (3,000,000), sheep (5,000,000), and pigs (1,000,000) to restock the depleted German larder, and a clear road by the Danube for the transportation of stores into Germany and the exit, by way of the Black Sea into the Mediterranean, of German submarines. A glance at a table of visible supplies—stocks existing in private depots, in mills, in railway stations, on port quays, and in silos, Dec. 31, 1915, as compared with stocks on Nov. 30, 1915, and Dec. 31, 1914—may be of special interest (quantities in quintals):

	Dec. 1915	Nov. 1915	Dec. 1914
Wheat .....	13,446,977	13,100,975	2,789,162
Rye .....	557,944	410,864	145,652
Barley .....	5,851,968	5,851,968	1,650,755
Oats .....	2,532,964	3,095,924	794,690
Corn .....	14,666,795	15,714,749	5,202,707
Wheat flour.....	447,935	472,285	375,473

A statement purporting to be based on an official report returns the following statistics for 1914 regarding the distribution of agricultural lands: 13,074,922 acres tillage, 1,299,382 fallow, 1,436,960 meadow, 2,948,472 pasture, 468,670 vine and orchard lands, 5,705,750 forest.

In the following table are shown for 1914-15 and (preliminary figures) for 1915-16 the area under principal crops, the production in thousands of metric quintals, and the yield in quintals per hectare in 1914-15:

	Hectares		1000 Qs.		Qs.
	1914-15	1915-16	1914-15	1915-16	
Wheat ..	1,904,249	1,960,188	24,486	21,470	12.8
Rye .....	78,613	80,780	744	.....	9.8
Barley ..	554,900	588,807	6,321	6,540	11.4
Oats .....	430,968	432,245	4,345	4,200	10.1
Corn .....	2,107,289	2,046,098	25,000	.....	11.9
Flax .....	5,850	7,915	22,062	.....	.....
Beets * ..	18,838	12,807	.....	.....	.....
Vines † ..	83,549	86,934	1,671	.....	.....
Tobacco ..	13,044	9,664	.....	.....	.....
Potatoes ..	11,288	14,051	.....	.....	.....

\* Sugar beets. † Production in thousands of hectolitres.

The petroleum output for 1915 was 1,673,145 metric tons, of which 429,087 metric tons were exported (154,688 to Germany, 255,699 to Austria-Hungary). Output, 1914, 1,783,957 metric tons; export, 654,024 (108,144 to Italy, 99,164 to Germany, 84,253 to Austria-Hungary, 77,971 to the United Kingdom).

**COMMERCE.** The export of wheat since Oct. 3, 1914, of wheat flour since Sept. 30, 1914, of oats since August 7th, and of rice since Aug. 1, 1914, has been prohibited. By decree of March 15th, the export of barley and rye has been prohibited. By royal decree of July 30, 1915, the prohibition of the export of wheat, rye, barley, oats, corn, and linseed, was removed and an export duty levied at the rate of six francs per quintal on wheat, rye, and flour, five francs per quintal on barley, oats, and meal, four francs per quintal on corn, and ten francs per quintal on linseed.

In the table below are shown imports and exports for three years, in lei:

	1911	1912	1913
Imports .....	616,504,872	637,905,560	590,012,640
Exports .....	691,720,408	642,103,788	670,705,835

In thousands of lei are given below imports and exports by great classes for 1912 and 1913:

	Imports		Exports	
	1912	1913	1912	1913
Animals & an. prods.	123,236	92,162	24,453	21,750
Agricultural prods.	213,506	167,360	544,207	511,035
Mineral prods.	175,981	180,471	71,504	136,652
Other prods.	125,183	141,020	1,940	1,268
Total .....	637,906	590,013	642,104	670,705

Details of the 1913 trade are given in the table below, values in thousands of lei:

Imports	1000 l.	Exports	1000 l.
Metals and mfrs.	173,075	Cereals, etc.	448,412
Textiles	64,902	Petroleum	131,481
Machinery	59,053	Legumes, etc.	34,124
Woolens	33,069	Timber, etc.	23,718
Explosives	31,171	Animal products	11,246
Vehicles	27,260	Live animals	2,899
Apparel	21,711	Metals, etc.	3,956
Skins, etc.	21,716	Wool	2,934
Silks	16,148	Hides, etc.	3,253
Woolen wares	23,026	Paper	1,265

Below are shown the most important cereal exports for 1912 and 1913, in thousands of lei:

Exports	1912	1913	Exports	1912	1913
Wheat	256,509	208,152	Oats	24,439	22,140
Maize	146,699	115,765	Millet	2,875	1,604
Barley	87,288	48,341	Flour	22,607	34,044
Rye	9,388	9,023	Bran	5,081	5,832

The principal countries of origin and destination follow, values in thousands of lei for 1912 and 1913:

	Imports		Exports	
	1912	1913	1912	1913
Austria-Hungary	240,435	237,819	42,536	52,408
Bulgaria	138,874	138,192	94,750	95,858
United Kingdom	88,000	55,738	48,041	44,840
Germany	39,063	34,136	49,948	63,526
Egypt	12,874	31,937	1,062	108
Netherlands	37,075	21,887	121,066	71,308
Russia	20,150	16,493	152,999	182,023
United States	14,827	15,256	25,869	36,853
France	16,536	12,905	6,226	3,651

Vessels entered in the 1913 trade numbered 32,499, of 10,253,223 tons; cleared, 32,306, of 10,176,885. The merchant marine included, Jan. 1, 1915, 133 steamers, of 40,949 tons, and 624 sailing, of 197,799—total 757, of 238,748 tons.

COMMUNICATIONS. The railway from Bucharest to Constantza on the Black Sea crosses the Danube at Chernavoda on one of the longest bridges in the world—11 miles. This bridge was blown up by the retreating Rumanian armies in October, 1916.

The railroads leading from the frontiers to Bucharest were in possession of the invaders by the end of the year, with telegraphs, telephones, post offices, and all the internal mechanism of administration comprehended within the invaded territory.

FINANCE. The monetary unit is the leu (par value, 19.295 cents). The actual revenue and expenditure for years indicated are in lei:

	1897-98	1909-10	1913-14
Revenue .....	210,838,729	522,842,688	608,502,889
Expenditure .....	217,335,486	481,921,854	512,253,722

The details of the 1915-16 budget, which are the latest available, are found in the 1915 YEAR BOOK.

GOVERNMENT. The two autonomous provinces of the Ottoman Empire, Moldavia and Wallachia, combined with the Dobruja, Dec. 23, 1861, to form an independent kingdom. The king is the executive, assisted by a council of eight ministers. A Senate (120 members) and a Chamber of Deputies (183) compose the legislative body. Reigning King, Ferdinand, nephew of Charles I, who was the son of Prince Charles of Hohenzollern-Sigmaringen; he came to the throne Oct. 11, 1914. He married (Jan. 10, 1893) an English princess—Mary, daughter of the Duke of Saxe-Coburg and Gotha. They have six children, the crown prince Charles (born Oct. 15, 1893), being the eldest. The King is the second son of the elder brother of the late sovereign, who came to the throne in 1866 upon the deposition of Prince Alexander John, who was proclaimed king instead of prince in 1881. He married (1869) Princess Elizabeth von Wied, popularly known as Carmen Sylva.

HISTORY. At the beginning of the year there was great uncertainty among the belligerents as to the course that Rumania would take. At that time, however, circumstances seemed to favor the Entente Allies, although the campaign of the German party continued. M. Carp, the former Prime Minister, visited Vienna. On the other hand, MM. Filipesco and Jonesco of the Opposite party paid visits respectively to Petrograd, London, and Paris. In general, the Brătianu cabinet seemed to try to preserve the balance between the belligerents; the government sold cereals to both sides. There were rumors of a crisis in the relations with the Central Powers in February, when it was reported that two representatives from the Hungarian province of Transylvania, known as "unredeemed" Rumania, had presented themselves for election, but on April 7th the government signed a convention with Germany for the free exchange of domestic products between the two countries and on May 15th a similar convention was made with Austria-Hungary. Parliament adjourned on April 9th, after approving a domestic loan of \$30,000,000 and voting a graduated tax on certain articles of luxury, as, for example, jewelry and automobiles.

On August 28th Rumania definitely entered the war on the side of the Entente Powers. For details, see the article WAR OF THE NATIONS. In the middle of October King Ferdinand explained the course of Rumania in entering the war on the side of the Allies as not due to any mere policy of expediency, and as not indicating bad faith to the Central Powers, but as based on large principles of nationality. Hungary was the hereditary enemy of his people, inasmuch as she held millions of their kindred in political bondage. There was no hostility toward Germany but rather friendship, since Germany from an economical point of view was an aid to Rumanian development. He defended the inactivity for which Rumania had been criticised, saying that as a small power with a small army and with a western frontier nearly 700 miles long, she was obliged to wait until she thought

she had a reasonable prospect of protecting herself and of having the support of the Allies. At the end of the year an address was issued by the Chamber of Deputies defying the enemy, declaring that the Rumanian army was not yet destroyed, and giving assurance that it would continue its resistance. It promised the peasantry, which, it said, made up the largest and most patriotic part of the army, their political and economical liberty in accordance with the solemn acknowledgment which had been made to them a few days before by the King. It said that as soon as victory was won, they would be placed in as favorable a position as regards their rights as any other class. It concluded with a patriotic declaration that since more than once Rumania had been able to drive out the enemy from her borders, she awaited with confidence the moment when she should again be free.

**RUMFORD MEDAL.** This medal of the American Academy of Arts and Sciences was awarded in 1916 to Dr. Charles G. Abbott, director of the Astrophysical Laboratory of the Smithsonian Institution.

**RURAL CREDIT.** See AGRICULTURAL CREDIT.

**RUSSELL, CHARLES TAZE.** ("Pastor Russell"). An American clergyman, died on board a train at Pampa, Texas, Nov. 1, 1916. He was born at Pittsburgh, Pa., in 1852, and was educated principally under private tutors. He began an independent ministry at Pittsburgh in 1878, and preached the doctrine that there is no other hell than that on earth, and interpreted the punishment of the Bible to be eternal death and not eternal torture. He soon had a large following. In 1881 the Watch Tower Bible and Tract Society of Pennsylvania was incorporated, with Pastor Russell as president. He removed to Philadelphia, and in 1909 came to Brooklyn, where he founded the People's Church. His popularity became so great that he had to preach in the Brooklyn Academy of Music. He publicly asked for no financial aid, but is understood to have received large contributions from wealthy followers. He traveled widely in his work, ministered to congregations all over the United States, and established a Tabernacle in 1911 in London. He toured the world in 1912. He edited the *Watch Tower and Herald of Christ's Presence*, a semi-monthly publication, and since 1886 had issued *Studies in the Scriptures*. His Sunday sermons were published by about 2000 newspapers.

**RUSSELL, GEORGE W.** See LITERATURE, ENGLISH AND AMERICAN, *Essays, etc.*, English.

**RUSSIA.** An empire of eastern Europe and northern Asia, extending from the Baltic to the Bering and from central Europe and Asia to the Arctic Ocean. An original member of the Triple Entente in the War of the Nations. Capital, Petrograd.

**AREA AND POPULATION.** The results of the annual estimate of population as returned Jan. 1, 1914, are given in the table below, together with density per square mile. The area is also given, in English square miles, for the purpose of showing relative extent of great divisions and their provinces or governments; but the total area in the table differs somewhat from the official total—19,099,866.9 square versts = 21,741,600 square kilometers = 8,394,018 square miles, without internal waters. Including Bokhara (203,430 square kilometers, 1,500,000 inhabitants), Khiva (67,430 kilometers, 800,000 inhab-

itants), and the inland seas (Caspian, 438,690; Azov, 37,600; Aral, 67,770), the total area of the empire is given as 22,556,520 square kilometers, or 8,709,116 square miles; total population, census 1897, 126,896,200.

	Sq. miles	Pop. 1914	D.
<b>1. European Russia:</b>

The population is made up of Slavs, including Little and White Lithuanians, Poles, etc., 91.8 per cent; Letts and Lithuanians, 3.1; Mongols (the Kalmuks of the Astrakhan steppes), Tatars (in Southern Siberia), Kartvelians (14.5 per cent of the population in the Caucasus), Turko-Tatars (20.2 per cent of the population in the Caucasus), Cossacks (only in the Cossack provinces), etc. Jews in Russia totaled at the last census 5,070,205—3,715,081 in European Russia, 1,267,194 in Poland, 46,739 in the Caucasus, 32,648 in Siberia, 8543 in Central Asia. Urban population (1910), 22,506,800; rural, 141,272,000.

An attempt to calculate rather roughly the division of the 1914 population estimate into urban and rural, male and female, is shown below:

Births in European Russia, exclusive of Finland, numbered (1912) 5,238,186; deaths, 3,185,962—an increase of births over deaths of 2,052,224. Emigration in 1912 was as follows: 462,500 Russians and 422,200 foreign subjects—a total of 884,700 persons—left Russian territory; and 367,000 Russians and 472,400 foreigners—a total of 859,400 persons—entered the empire.

	<i>Urban</i>	<i>Rural</i>	<i>Male</i>	<i>Female</i>

Central Asia .....	1,607,900	9,495,600	5,925,900	5,177,600
	<b>26,297,600</b>	<b>148,840,200</b>	<b>87,740,800</b>	<b>87,897,500</b>

Some of the important towns in the great divisions are given in the next table, with their population in 1913 (Finland 1912), except where otherwise indicated in parentheses:

In 1913, 950,000 (529,000) Russians departed from Russia and 920,000 (404,000 Russians) entered. Emigrants to the United States in 1913 numbered 291,040; and in 1912, 162,395.

<b>European Russia:</b>	<i>Pop.</i>	<b>European Russia:</b>	<i>Pop.</i>

EDUCATION. According to the 1914 "Year Book of Russia," published by the Central Statistical Committee, the total schools of all kinds (A), total primary schools (B), and the total attendance at all schools (C) on Jan. 1, 1912, were as follows, exclusive of the cities of Petrograd, Kronstadt, and Baku, the governments of Warsaw and Tiflis, and the province of Kamchatka:

	<i>A</i>	<i>B</i>	<i>C</i>
European Russia.....	95,381	5,523,143	6,151,588
Poland .....	7,022	291,931	339,008

	A	B	C
Caucasia .....	2,685	165,410	177,877
Transcaucasia .....	2,548	127,657	145,081
Siberia .....	6,245	808,247	841,271
Central Asia .....	8,693	95,785	111,974
<b>Total .....</b>	<b>122,524</b>	<b>6,512,178</b>	<b>7,266,694</b>

To the total number of 7,266,694 students or pupils must be added: 206,961 pupils of private schools, lay or religious of Christian creeds; 958 pupils of schools for blind, and deaf and dumb; 329,585 pupils of religious schools of non-Christian creeds; and 233,911 not classed in the above categories. Total number of persons attending the schools of the empire (exclusive of Finland), 8,038,109.

**AGRICULTURE.** Much of the area of the empire is unfit for any kind of cultivation; the north is frozen during all but a few weeks, when pasture grass and berries grow; in the south, sandy steppes meet the head of the Caspian Sea, and dense forests occupy large tracts in the interior provinces and in Siberia. Between the Baltic and the Black seas, however, the soil is exceedingly fertile, producing great quantities of grain. Out of a total of 102,935,619 dessiatines (1 dessiatine = 2.7 acres) under private ownership, 26,812,251 belong to the peasants; 49,361,677 to the nobles; 16,093,974 to merchants, etc.; 154,689,573 to the crown, churches, etc.; 15,778,677 to corporations. Sixty-five per cent of the total forests of the empire is owned by the government (which derives an annual average revenue of 70,000,000 rubles from the timber industry), 23 per cent by landed proprietors, 9 per cent by the peasantry. The distribution of agricultural lands is shown below in acres (cereals, meadows, total with other of cultivated lands):

	Cereals	Meadows	Total
European Russia	196,997,000	61,830,000	209,789,000
Poland .....	11,877,000	2,280,000	14,078,000
Caucasus .....	22,078,000	5,676,000	22,612,000
Siberia .....	14,925,000	17,132,000	15,864,000
Central Asia .....	11,458,000	9,388,000	11,761,000
<b>Total * .....</b>	<b>256,830,000</b>	<b>95,756,000</b>	<b>278,599,000</b>

\* For 89 governments and provinces (Siberia, 8).

In another table is shown production of cereals, hay, and potatoes by great divisions of the empire, and the total for the 88 governments and provinces of the empire returning calculations, in thousands of poods, for 1912 and 1913:

	Cereals	Hay	Potatoes
European Russia	1912 3,798,984	2,889,250	1,538,188
	1913 4,262,606	2,091,502	1,452,116
Poland .....	1912 314,842	123,585	683,327
	1913 313,708	141,369	687,562
Caucasus .....	1912 859,850	168,873	39,218
	1913 536,328	168,694	32,800
Siberia .....	1912 267,728	620,255	48,697
	1913 823,629	558,211	57,424
Steppes .....	1912 200,749	405,040	9,388
	1913 200,384	291,362	11,389
Empire .....	1912 5,072,104	3,727,002	2,318,767
	1913 5,636,601	3,246,188	2,191,291

In 1913-14 there were reported 1,687,125 acres under cotton in central Asia and the Caucasus, producing 1,030,147 bales (500 pounds each); in 1914-15, 1,816,096 acres, 1,125,675 bales.

The statistics in the table next following cover 48 governments of Russia in Europe only, and show area in thousands of hectares and yield in thousands of quintals of important grain

crops (a = winter grain, b = spring grain), for two years, with the yield per hectare in 1915:

	1000 Hectares		1000 Quintals		Qa.
	1916	1915	1916	1915	
Wheat a.....	5,572	6,496	68,504	78,039	12.0
b.....	14,066	17,067	98,544	125,082	7.4
Rye a.....	23,459	24,450	212,438	225,144	9.2
b.....	178	283	1,116	1,770	7.6
Barley .....	10,160	11,378	96,818	108,530	9.4
Oats .....	14,363	14,427	126,276	131,782	9.1
Corn .....	1,484	1,585	18,286	19,951	12.6

According to the statistics issued by the All-Russian Sugar Refiners' Society the area under sugar beet in Russia in 1916 was 590,775 dessiatines, as compared with 660,796 dessiatines in 1915. The yield, it is estimated, was 644,246,000 poods (11,633,000 tons), as against 687,583,000 poods (12,415,000 tons) in 1915, the yield per dessiatine being 1090 poods, as compared with 1040 poods in 1915.

In view of the speculation concerning supplies held by belligerent countries, it may be of interest to compile a table of visible stocks of grain stored at ports, in interior mills and depots, and in railway elevators and warehouses on July 14th of the years indicated (in quintals); the second 1916 column is for May 14th:

	1916 (*)	1916 (‡)	1915 (†)	1914 (†)
Wheat ....	3,125,212	1,702,733	3,365,660	2,600,414
Rye .....	615,070	317,453	905,676	992,509
Oats .....	463,501	581,898	593,841	756,958
Barley ...	485,648	462,846	2,414,627	447,203
Corn .....	67,979	87,841	122,708	91,436
Flour .....	1,166,158	847,159	1,227,207	1,188,403

(\*) Berdiansk and Chistopol excluded. (†) Berdiansk excluded. (‡) Berdiansk and Tsaritayn excluded.

Live stock in the country (1914) by great divisions and total is given below (A = European Russia, B = Poland, C = Caucasus, D = Siberia, E = central Asia, T = Total):

	Horses	Cattle	Sheep, etc.	Pigs
A .....	22,529,000	32,704,000	87,240,000	11,581,000
B .....	1,098,000	2,014,000	565,000	452,000

E .....	4,414,000	5,014,000	16,168,000	185,000
<b>T. ...</b>	<b>34,978,000</b>	<b>52,052,000</b>	<b>72,278,000</b>	<b>14,995,000</b>

**THE FOOD PROBLEM.** In Russia generally, and in Petrograd more especially, the rise in the cost of living has attained an alarming altitude. Fish, instead of 30 kopeks a pound, now costs a ruble, 50 kopeks; butter, instead of 60 kopeks, is two rubles, 50 kopeks; meat from 27 kopeks has leaped to a ruble.

Information of the statistical section of the Moscow municipality furnished the ministry for foreign affairs affords a good idea of the course of this growth (prices quoted are for goods of various groups before the war and in July, 1916). The price of cereal products rose from 43 to 131 per cent. Millet rose 97 per cent., buckwheat 131 per cent. Dairy products exhibit even greater rises; almost all increased 100 per cent or more. For instance, cream butter 123 per cent, curds 125 per cent, cheese 180 per cent, Dutch cheese 344 per cent, etc. In the grocery group, such products as vermicelli, macaroni, yeast, show a rise of 50 per cent, sugar 57 per cent. Rice rose 150 per cent, coffee 150 per cent.

Vegetables and green groceries rose from 40 to 150 per cent. But all these increments are overshadowed by the increase of meat and meat products, in which smaller rises than 200 per cent are rarely encountered. For example, beef of prime quality costs 250 per cent more than before the war; of second quality, even 300 per cent; veal 234 per cent, mutton 281 per cent, pork 142 per cent, ham 150 per cent more. Sausages have risen two and three times in value. Thus meat is from two and a half to four times as expensive now as before the war. Similarly as regards poultry. Fish generally is twice and two and a half times as dear; herring are even four to five times.

The country has been interested in the proceedings of the so-called Alimentation or Food Congress, convoked in Petrograd for the purpose more especially of formulating a scheme for the establishment of firm prices on grain and other products. Incidentally, the vice-minister of agriculture, M. Glinka, furnished the meeting with some interesting data concerning the food campaign for the previous two years.

"During the first year," he said, "there were stocked more than 300,000,000 poods (4,800,000 tons) of various cereals, and during the second year more than 500,000,000 (8,000,000 tons), while it is purposed to stock 700,000,000 (11,200,000 tons) more; these figures testify to the magnitude of the task which rests upon the organization and the dimensions of the state undertaking which has been carried through till the present day. The value of the grain alone that has been stocked by the delegates exceeds a milliard (\$500,000,000), and it is proposed to expend yet another milliard. Yet, notwithstanding the size of these figures, they are for Russia, with her mighty agricultural husbandry and illimitable scope, far from considerable. We are entering upon the third year of the war, and are happy to be able to state that for the whole time our army has never run short of rations, and will not do so hereafter, even though the war should last an indefinite period. We have an enormous stock of grain. More than half a milliard poods (8,000,000 tons) of the old harvest still remain unexpended, and meanwhile there has begun the almost universal crop of new cereals, the supplies of which will be very considerable.

"When we set about the stocking of grain we met with an acute shortage of storage accommodation at stations where the grain could lie till shipment. This circumstance not only adversely affected the preservation of the grain, but rendered us unable to provide a constant reserve in which large supplies could be accumulated in good time. But during the past two years premises have been provided for fresh millions of poods of grain."

No lesser task is being carried out by the organization in furnishing the army with sugar. As stated by the Alimentation Conference, a series of measures have been adopted and all supplies of sugar at the sugar factories have been concentrated at the disposal of the government, which itself has prepared and cleared the way for further governmental measures in this sphere.

It is interesting to compare the rise in prices in Russia and Germany respectively. For this purpose the figures ruling in Moscow and Berlin have been taken as most representative:

Articles	Berlin Per cent	Moscow Per cent
Rye bread	42	48
Wheat bread	27	45
Rye flour	47	95
Wheat flour	14	58
Butter	114	128
Lard	300	178
Sugar	27	57
Coffee	183	180
Eggs	225	93
Milk	38	70
Beef	280	250
Mutton	180	288
Veal	170	234
Pork	114	142
Ham	188	144
Potatoes	58	44
Rice	427	150

**FORESTS.** Total area under crown forest in the empire, 349,094,692 dessiatines (105,338,965 in European Russia, 217,192,375 in Siberia); area worked by the government, 179,851,094 dessiatines. A table follows showing the revenue from state forests for June, for the first six months of 1916 in comparison with receipts for the corresponding periods of 1915, and 1916 increase; also for the year 1915 (in rubles):

	1916	1915	1916 +
June	5,525,744	4,879,026	646,718
Jan. 1-July 1	36,044,807	33,017,164	3,027,143
Jan. 1-Dec. 31		72,806,776	

**MINING AND METALS.** The empire is rich in minerals, quantities of which are found in the Obdorsk, the Ural, and the Altai mountains; but the industry is undeveloped. Capital is wanting, and the government does not encourage foreign enterprise. The great distances to be traversed and lack of transportation facilities militate against economical transportation of the requisite machinery. The table below gives the production for comparative years of the most important products of the mining and metallic industries in metric tons:

	1911	1913
Gold *	58,708	58,462
Platinum *	5,774	5,525
Silver *	15,512	18,018
Lead	1,238	1,699
Zinc	12,212	11,708
Copper	26,112	33,531
Pig iron	3,589,000	4,198,000
Iron and steel	2,887,000	3,727,000
Coal	28,414,000	30,910,000
Naphtha	9,152,000	9,260,000
Salt	2,013,000	1,906,000

\* In kilograms

In thousands of poods, by important centres of the metallic industries, is given production for comparative years below:

	Pig iron		Iron & steel, worked	
	1911	1913	1911	1913
So. Russia	147,747	178,379	112,748	128,062
Ural and Siberia	44,867	50,589	37,172	39,442
Cent. Russia	5,228	8,289	9,425	9,686
Volga			7,560	10,353
N. and Baltic	77	63	13,183	15,860
Poland	21,161	28,945	22,619	24,687
Total	219,075	256,265	202,702	227,540

Output of coal in 1914, 2,060,340 poods—1,713,100 in the south, 236,000 in Poland, 88,000 in the Ural region, 18,560 in Central Russia, 4080 in the Caucasus.

Output of petroleum in 1914, 530,000,000 poods (398,000,000 from the Baku district); 1915, 572,000,000 poods (Baku district, 446,000,000).

**MANUFACTURES.** The number of factories under state supervision Jan. 1, 1915, is given at 14,056, employing 1,960,860 persons. Distilleries 2406, output of alcohol 60,812,000 gallons; sugar works 237, output 106,110,000 poods; flax, jute, and hemp factories 414, value of annual output about 73,000,000 rubles; cotton spinning and weaving mills 140, value of annual production about 607,000,000 rubles.

Although the sale of alcohol in the form of drink has been abolished, the manufacture continues in perhaps larger amounts. Enormous quantities have been exported to France for use in the manufacture of high explosives.

In the figures of profits of liquor monopoly are included (a) debts recovered; (b) sums brought in after the winding up of big shops where the accounts were not simple; (c) sale of vodka in Russian central Asia and Transcaucasia (lately prohibited in both these districts also); (d) sale abroad; (e) the sale in government shops of Caucasian mineral waters, now very extensive.

Under the heading liquor excise is included the tax on mineral waters, grape juice, etc., tax on real wine in central Asia and Transcaucasia, on wine specially supplied for foreign consumption, on wines allotted to chemists for medical purposes, etc. The great increase in the returns is due to the tax on non-alcoholic drinks and government sales.

For the first time in the industrial history of Russia a platinum-refining factory has been operating since March, 1916, at Yekaterinburg. This factory has been constructed by a company of the Nikolo-Pavdinsk mining district, which in this manner has made a beginning in the task of liberating the Russian platinum industry from dependence on foreign markets.

American industrialists are taking measures for the organization of commercial relations with Russia. With this object a group of American mills and factories has established at Moscow an office to which is attached a museum containing samples of their products, including agricultural implements, machinery, rubber goods, paper, motor-cars, "notion" and trinket wares, foot-gear, leather, and rubber goods. A similar museum has been established at Chicago with a museum of Russian products and manufactures. Information about American and Russian goods respectively can be obtained at both these offices.

The degrees of activity of German and British undertakings in Russian industry may be compared by a reference to the amounts of capital involved. Out of a total capital of 3,964,126,000 rubles invested in industrial enterprises in 1914 native companies are represented by 3,376,780,000 rubles and foreign companies by 587,346,000 rubles. Of this latter, 156,581,000 rubles represent British capital and 67,969,000 German capital, which would not seem to give Germany a position of great industrial importance. As a matter of fact, however, it is claimed on the authority of the economist A. Bashmakov that fully one-fifteenth of the largest undertakings registered as native companies, and possessing a total capital of 110,575,000 rubles, are none other than German companies masked as Russian enterprises. The figures representing the total

German capital of companies established in Russia would, therefore, be at least 178,544,000 rubles—that is to say, more than 4 per cent of the total value (or 30 per cent of the total foreign capital).

While British capital is invested only in certain enterprises, such as mines and particularly in oil, the Germans are preëminent in the production of foodstuffs, electrical machinery, chemical products, timber, and in metallurgy. The influence of German capital in Russian industry is more far-reaching than that of British capital, for two essential reasons—first, because it is concerned with products absolutely indispensable to life; and second, because it is said to have secret forms of extension which mask the real measure of German penetration into Russian industry.

**FISHERIES.** The latest figures were for 1912: Total number of persons engaged, 296,200; yield in poods, 43,923,000; value in rubles, 97,155,000.

**COMMERCE.** The export of cereals, flour, and linseed, except to Allied countries, has been prohibited since Aug. 8, 1914. Exceptions may be authorized for exports to neutral countries. By Imperial ukase of March 10, 1915, the export of foodstuffs and of fodder has been prohibited except under special permit from the government in each case. By a decree dated May 17, 1915, the export of corn is permitted if destined for Allied countries.

In the table below is shown the trade for comparative years by the great avenues of distribution—A, by way of the European frontier; B, by the Black Sea (Caucasus) frontier; C, across the Asiatic frontier; D, to and from Finland; E, total across all frontiers; values in thousands of rubles:

Imports:	1912	1913	1914	1915
A	969,900	1,146,300	854,300	429,100
B	21,600	18,350	22,400	1,400
C	185,100	153,500	159,900	439,800
D	45,200	56,000	62,400	243,700
E	1,171,800	1,374,100	1,098,000	1,114,000
Exports:	1912	1913	1914	1915
A	1,267,800	1,232,800	706,100	181,800
B	110,600	132,900	104,300	.....
C	90,800	99,200	90,000	83,800
D	49,600	55,800	55,700	182,600
E	1,518,800	1,520,200	956,100	392,200

The statistics to follow relate to trade by way of the European and Black Sea (Caucasus) frontiers, and to and from Finland; trade by great classes is given in thousands of rubles:

Imports:	1913	1914	1915
Foodstuffs	163,002	120,872	75,578
Raw materials	622,495	471,992	297,840
Animals	3,105	2,412	870
Manufactures	431,987	848,823	800,850
Total	1,220,589	939,098	674,138
Exports:	1913	1914	1915
Foodstuffs	807,183	492,080	169,113
Raw materials	550,326	339,074	180,643
Animals	32,985	12,918	5
Manufactures	80,455	22,032	14,137
Total	1,420,949	866,104	313,888

The principal details of the cereal export are given as follows for 1914 and 1915:

	1000 Poods		1000 Rubles	
	1914	1915	1914	1915
Wheat	147,000	11,100	168,900	18,600
Rye	23,800	5,800	19,800	9,800
Barley	120,600	400	94,400	400
Oats	16,800	100	14,100	200
Corn	17,400	.....	12,600	100
Other	49,400	19,500	45,800	38,900
<b>Total</b>	<b>874,600</b>	<b>86,900</b>	<b>849,600</b>	<b>68,000</b>

The principal articles of import for consumption and of export of domestic produce follow, for comparative years, with values in thousands of rubles:

	1000 Rubles		
	1913	1914	1915
<b>Imports:</b>			
Cotton	100,098	88,506	42,700
Machinery	163,727	135,871	45,414
Tea	30,696	32,094	34,767
Wool	53,116	39,801	7,265
Metals	52,785	55,049	78,827
Rubber	42,280	29,968	82,241

Denmark	35,603	17,376	412	35,603	17,376	412	35,603	17,376	412

According to preliminary data, the value of exports and imports for January to July, 1916, 1915, and 1914 fluctuated as follows (A = by the

European, etc., frontiers, B = by the Asiatic frontier), in thousands of rubles:

	A.		B.	
	Imps.	Exps.	Imps.	Exps.
1916	212,423	589,787	57,448	481,811
1915	125,010	244,188	41,522	184,173
1914	800,914	782,847	56,758	115,318

By all frontiers of the empire exports for the aforesaid period in 1916 amounted to 269,871,000 rubles, in 1915 to 166,532,000 rubles, and in 1914 to 857,667,000 rubles; imports for same period in 1916 amounted to 1,071,598,000 rubles, in 1915 to 428,361,000 rubles, and in 1914 to 898,160,000 rubles.

From the preliminary data quoted above it will be seen that during the current year, with an increase of exports in comparison with 1915, by the European and Asiatic frontiers, of 103,339,000 rubles in all, or 62.1 per cent, imports increased by 643,037,000 rubles, or 150.2 per cent; the increase of imports over exports amounted to 801,727,000 rubles, against 261,829,000 rubles in 1915. Exports for the first half of 1916 proceeded chiefly to Great Britain (53,956,000 rubles); France (15,085,000 rubles); Rumania (4,083,000 rubles); Sweden (3,289,000 rubles); and Finland (87,400,000 rubles). The following exports, judged by value, were the most important—flax (41,792,000 rubles), wheat flour (18,219,000 rubles), sugar (9,291,000 rubles), hemp (7,907,000 rubles), deals (7,590,000 rubles); rye flour (6,791,000 rubles); skins of all kinds (4,039,000 rubles); undressed hides (3,935,000 rubles); raw cotton and cotton wool (3,397,000 rubles).

Imports from January to June, 1916, proceeded chiefly from Great Britain (111,070,000 rubles); the United States (100,921,000 rubles); France (51,232,000 rubles); Sweden (37,116,000 rubles); Japan (15,994,000 rubles); China (15,430,000 rubles); and Finland (94,202,000 rubles). (The foregoing figures do not include imports through Vladivostock, which are given below.) According to value, the following imports were most important—metal ware of various kinds (53,670,000 rubles), stationery (43,896,000 rubles), tea of all kinds (25,945,000 rubles), machinery of cast-iron, iron, and steel (24,981,000 rubles), iron and steel ware (17,682,000 rubles), copper in bars and scrap (17,244,000 rubles), wire and wire ware (16,366,000 rubles), leatherware (13,121,000 rubles), raw wool (10,592,000 rubles), rubber and guttapercha (10,563,000 rubles), motor-car platforms and chassis (10,286,000 rubles), lead in pig and scrap (9,318,000 rubles), silks and silk waste (9,250,000 rubles), four-seated motor-cars and over (8,754,000 rubles).

The total value of imports at Vladivostok for January to May, 1916, grew to 290,461,000 rubles, against 78,657,000 rubles in 1915, including imports from the United States for 165,246,000 rubles; from Japan for 70,710,000 rubles; from Great Britain for 37,642,000 rubles; and from China for 12,954,000 rubles.

SHIPPING. Vessels and tonnage entered and cleared in the total foreign trade of the empire for 1912 are shown in the 1915 YEAR BOOK.

COMMUNICATIONS. The expansion of railways from 1903 to 1912 inclusive, in English miles (E. R. = European Russia, A. R. = Asiatic Russia), was as follows:

Years	E. R.	A. R.	Total
1908	31,299	5,158	36,452
1904	31,735	6,372	38,107
1905	32,108	7,478	39,586
1906	32,743	8,005	40,748
1907	33,048	8,128	41,176
1908	34,108	10,472	44,580
1909	34,465	10,485	44,950
1910	34,581	10,497	45,078
1911	35,447	10,578	46,025
1912	35,937	10,586	46,523

An important development was the establishment of a new town and ice-free port about 6 degrees west of Archangel and saving a sea haul of about 700 miles. This port, known as Murman, comes within the sweep of the Gulf Stream and is the terminus of the Murman Railway, which, while projected before the war, was nearly completed in 1916, and formed the most northerly line in the world. In 1915 700 Canadian engineers were sent to Russia and construction work was rapidly prosecuted, notwithstanding the long polar nights. It is divided into four sections: Petrograd-Zwanka, 76 miles; Zwanka-Petrosavodsk, 171 miles; Petrosavodsk-Kem, 272 miles; Kem-Kandalascha, 215 miles; and Kandalascha-Murman, 177 miles. Of these, at the end of 1916, the Kem-Kandalascha was the only one that had not been completed. The new system was important for many reasons. It serves a valuable timber country embraced between Norway and the White Sea and bordering on the Arctic Ocean. The main points on the line are Murman, Kola, Alexandrovska, Kandalascha, Kanda, Kem, the west coast of Lake Onega, and Petrograd. The new line reduced considerably the rail haul from the Arctic terminal ports to Petrograd. Thus at Murman, 7 miles to the north of Kola, there were temporary wooden wharves for three large vessels with 25-ton cranes, and a harbor so large and roomy that over 40 vessels can anchor at the same time.

Another new project of the year was a railroad from Batum to Trebizond. The new railway, which was to be of the ordinary Russian 5-foot gauge, was planned, as far as possible, to skirt the foot of the mountains and follow the coast. Notwithstanding difficulties of construction the state engineers believed that they could finish the work in six months. It was not expected that the new line would be of much immediate value for general commerce.

Gross receipts (1914), 1,122,132,000 rubles (state lines, 772,486,000 rubles, company lines, 342,153,000; local lines, 7,493,000). For telegraphs, etc., see 1915 YEAR BOOK.

FINANCE. The monetary unit is the ruble (par value 51.456 cents), and the standard of value is gold. In the following table are shown revenue and expenditure in rubles; 1913 actual, 1915 and 1916 budget:

	1913	1915	1916
Rev. ord.	3,417,359,530	3,132,174,314	2,914,083,005
Rev. extra.	13,845,256	70,318,878	336,832,192
Total	3,431,204,786	3,308,561,986	3,250,915,197
	1913	1915	1916
Exp. ord.	3,094,248,094	3,174,124,091	3,068,055,297
Exp. extra.	288,665,314	134,497,695	76,791,106
Total	3,382,913,408	3,308,561,986	3,144,846,403

Partial details of the budget for 1916 are given in the table below in thousands of rubles:

Revenue:	1000 r.	Expenditure	1000 r.
Direct taxes	359,674	Public debt	580,323
Spirits	24,261	Council	9,098
Tobacco	149,594	Holy Synod	58,966
Sugar	180,858	Civil list	16,860
Naphtha	82,040	Foreign affairs	7,194
Matches	43,518	War	590,489
Customs	314,400	Marine	182,587
Railways	685,508	Finance	324,162
Domains	41,078	Commerce, etc.	63,515
Forests	75,891	Interior	324,162
Excise	49,860	Instruction	165,160
Duties	432,602	Communications	686,813
Posts	94,680	Agriculture	138,791
Tels. & tels.	70,600	Justice	101,786

		Other	
Total ord.	2,914,083	Total ord.	3,068,055
Extraord.	336,832	Extraord.	76,791
Total	3,250,915	Total	3,144,856

By imperial command on August 29th (September 11th), by virtue of Article 87 of the Fundamental Laws, authority is granted to the State Bank, as a temporary war measure, to issue credit notes up to two milliards of rubles over and above the amount already authorized. Thus for the third time the emission right of the State Bank is expanded under Article 87. On the first occasion, it was expanded by imperial command of July 20 (Aug. 2), 1914, to the amount of 1,200,000,000 rubles; the second time on March 17 (30), 1915, to the amount of 1,000,000,000 rubles; and lastly, on Aug. 29 (Sept. 11), 1916, it was extended another 2,000,000,000 rubles. Only once was the expansion of the bank's note-issuing power effected with the direct approval of the legislative assemblies (Aug. 22-Sept. 4, 1915).

On Sept. 1 (14), 1916, the gold specie in the coffers of the State Bank amounted to 1,552,000,000 rubles. According to Russian law, credit notes issued above a certain norm must be secured ruble for ruble by gold; therefore, the total issue of credit notes may be raised, in accordance with the imperial command of August 29th (September 11th), to 7,052,000,000 rubles. As a matter of fact, by September 1st (14th) the issue had already reached 7,220,000,000 rubles (and by September 8th-21st—even 7,350,000,000 rubles), so that the percentage ratio of gold to this issue represented about 21.5 per cent. In addition to gold in specie, the note issue is further guaranteed by the so-called gold fund abroad, more correctly by various credits of which the Russian government disposes abroad. The fund on September 1st (14th) amounted to 2,055,000,000 rubles. Thus with the inclusion of the 5,500,000,000 rubles of all unsecured credit notes permitted the State Bank, it will be seen that the total amount of all credit notes may be brought up to 9,107,000,000 rubles, while if the foreign gold fund be taken into consideration, the gold guarantee for credit notes constitutes almost 40 per cent; although if we count as gold security only gold specie, the ratio declines to 17 per cent.

The note issue in Russia is the largest in the world. For instance, on September 1st (14th) the note issue of the Bank of France had reached 16,603,000,000 francs—i.e. 6,226,000,000

rubles; that of the German State Bank (on August 31st-September 13th) 7,117,000,000 marks—i.e. 3,295,000,000 rubles; that of the Bank of England (on September 1st-14th) only £36,100,000, or together with exchequer bills, £165,000,000—i.e. 1,500,000,000 rubles. And the gold guarantee of these note issues was considerably higher than the Russian. Thus in France it amounted to 25.6 per cent; in Germany to 34.7 per cent; and in England even to about 50 per cent (in Russia, as already stated, it is only 21 per cent). Concurrently with the foregoing the quotation of the ruble experienced much greater depreciation than that of the pound sterling, the franc, or even the mark, although in this depreciation other factors than the volume of note issues and its weak gold guarantee must be taken into account.

State expenditures are rapidly increasing. Ordinary expenditures for 1917 cannot be fixed at less than from 3,800,000,000 to 4,000,000,000 rubles, for 1918 at 5,200,000,000 rubles, and for 1919 at 5,700,000,000 rubles. It is imperative to discover constant and reliable sources to cover these growing outlays—the chief cause of which is the payment of war loans—more particularly when it is remembered that the state has abandoned the vodka revenue.

The ministry of finance has drafted, and partly carried into effect, a series of new indirect taxes of which we may note tax on textiles or yarn, tax on electric energy, tax on potato syrup, tax on grape wine. The old taxes the government continues to increase. The increase is proposed, and has already been partially effected, of the taxes on tea, petroleum products, and tobacco. The question of increasing the tax on sugar is being considered. The question of introducing state monopolies as a more perfect and productive means of indirect taxation stands alone. Tea, sugar, and match monopolies are first on the list. But in special circles the establishment of monopolies for wine, electric energy, and salt is seriously formulated. The question has been raised of compulsory syndicates—coal, petroleum, coffee, and rubber. The ministry of agriculture has of late been engaged in drafting a project for a monopoly of the grain trade, and the ministry of the interior an insurance monopoly project. There is serious talk about a drug and even a cinematograph monopoly. The nationalization of the railways and the timber business will come up for consideration after the war.

In 1916 in Great Britain the discount was effected of short-term (one year) bonds to the face value of £175,060,000, besides the sum of £114,340,000 discounted in 1915. Altogether in England there are at the present time bonds for £388,220,000. In France in 1916 the realization was effected of short-term bonds to the amount of 490,000,000 francs, besides 55,000,000 francs in 1915. Altogether there are in circulation in France bonds for 1,117,000,000 francs. According to the conditions of the agreement with the French government, the Russian government in proportion to its need receives three-months bills of the French exchequer which are discounted by the Bank of France out of the 5 per cents. In America in 1916 were issued short-term bonds for £11,000,000, and to replace those issued in 1915 for £10,200,000. Seeing that the bonds issued in America are paid on expiry of the term of their circulation, there is introduced

into the estimates an assignment of 534,435 rubles for payment of interest for the first half of 1917. In Japan the issue was effected of short-term bonds of the state exchequer for 50,000,000 yen of 5 per cents, with a term of one year.

The principal items of expenditure, according to the estimates of state credit for 1917, are the following—state debts in foreign currency unredeemable till Jan. 1 (14), 1917, amount to 50,958,198 rubles, interest on which, payable in 1918, amounts to 2,191,385 rubles. Debts redeemable on Jan. 1 (14), 1917, amount to 2,743,975,038 rubles. Interest payable thereon for 1917 is 104,557,864 rubles, and the amount payable on account of redemption of principal is 21,882,332 rubles. State debts effected in rubles equivalent to one-fifteenth of the imperial, unredeemable till Jan. 1 (14), 1917, remain at 3,265,472,285 rubles, and interest thereon for 1917 is 131,387,986 rubles. The redeemable debts are 8,480,569,482 rubles, interest on which for 1917 amounts to 430,738,335 rubles, and payment for redemption of principal 28,311,863 rubles.

The total national debt on Jan. 1 (14), 1917, is 14,540,272,995 rubles. Payment of interest on this amount is 668,875,570 rubles for 1917, and for redemption 50,194,695 rubles. Short-term exchequer bonds on Jan. 1 (14), 1917, are—in Russia, 6,500,000,000 rubles; abroad, 4,179,963,000 rubles. Interest payable on the latter for 1917 is 534,435,000 rubles. Thus the volume of debt outstanding on Jan. 1 (14), 1917, is equivalent to 25,220,963,895 rubles, interest on which amounts to 669,410,005 rubles, and payment for redemption 50,194,695 rubles. The total assignment for ordinary state debts and payment on account of interest and redemption is 719,604,700 rubles. Payments on redeemed debts are 60,000,000 rubles, bank provision 231,750 rubles; management expenses, 898,623 rubles; making total payment on account of state loans of 728,795,073 rubles. The total state debt on Jan. 1 (14), 1917, increased in comparison with the figures for Jan. 1 (14), 1916, by 6,344,206,084 rubles. See also BANKS AND BANKING; FINANCIAL REVIEW.

GOVERNMENT. Russia is a (nominally) constitutional monarchy under an autocratic czar, who is supreme ruler and legislator. The constitution of October, 1905, confers upon the people civic liberty based upon individual inviolability and freedom of conscience, speech, assembly, and association. The Council of Empire is composed of an equal number of elected members and members nominated by the Czar. The Duma (reduced to 442 members) has large powers of legislation, so long as none of the "fundamental laws of the imperial administration" are involved. The ruling senate, partly deliberative, and partly executive, is the high court of justice for the empire; the Holy Synod is the regulator of religious affairs; the Council of Ministers is composed of heads of departments.

The reigning Czar, Nicholas II Alexandrovich, of the house of Romanoff-Holstein-Gottorp, Emperor and Autocrat of all the Russias, was born at Petrograd May 18, 1868, and succeeded his father Nov. 1, 1894. He married (November, 1894) Princess Alix of Hesse; they have issue four daughters and a son, the heir-apparent, Alexis, born at Peterhof Aug. 12, 1904.

## HISTORY

**ECONOMIC CONDITIONS.** A sharp debate occurred on the occasion of the presentation of the budget toward the end of February. The deficit, after meeting both ordinary and extraordinary expenditures, was estimated at 355,000,000 rubles, and the war expenditures which were running at the rate of about 31,000,000 rubles a day threatened to reach a total at the close of 1916 of 11,000,000,000 rubles, as compared with 8,000,000,000 rubles in 1915. The budget, however, was finally accepted by the Duma and the Council of the Empire and it was approved by the Czar on April 24th. Among its features were an income tax applying to all incomes of 850 rubles and over; and a considerable increase of the educational appropriation. Down to the close of the year only a small portion of Russia's war debt had been funded. Large advances were made to her by Great Britain and France, and during the year two loans of \$50,000,000 each had been placed by her in the United States, on June 13th and November 3rd. Since the beginning of the war the balance of trade had been heavily against her. For the first six months of 1916, it was reported at over \$520,000,000. In the closing months of the year there were reports of a scarcity of the necessaries of life throughout a wide area of the country, owing largely to the interruption of the regular trade with Great Britain. Manufacturing in the interior cities had greatly declined. Additional restrictions on American trade were announced in December.

**THE STÜRMER MINISTRY.** Unsubstantiated rumors of a cabinet crisis and the resignation of Premier Goremykin at the close of 1915 were confirmed at length on Feb. 1, 1916, by his retirement on the ground of ill health, though it was supposed that it was in consequence of the criticism of his administration as inefficient and unsuccessful. He was succeeded by M. Boris Stürmer, who was, in the opinion of his critics, a reactionary and was, further, an object of suspicion on account of his German descent. Soon afterwards Comptroller-General Kharitanov resigned and was succeeded by M. Pokrovsky. The opening days of the administration were marked by the success of the Russian army in Asia Minor, where on February 16th they had captured the great Turkish stronghold, Erzerum. (See **WAR OF THE NATIONS.**) The session of the Duma was opened on February 22nd and the Czar attended it for the first time in person, a circumstance regarded as a step toward establishing closer relations between the throne and the representatives. The ministry soon found itself at odds with the Liberal element and with those who favored a vigorous prosecution of the war. The Liberal groups blamed it for failure to grant the necessary measures of political liberty and racial equality and for not according generous treatment to the Finns and Poles. Persecution of the Jews was alleged, and in a debate on that subject on March 24th, there was a scene of great disorder in the course of which the Conservative party left the hall. New changes in the ministry followed these attacks, and M. Khvostov resigned as Minister of the Interior. At about the same time the War Minister, M. Polivanov, resigned and was succeeded by General Shuvayev who had been Director of the Commissariat. The preceding

War Minister, General Soukhoulinov, had been blamed for failing to supply both munitions and strategic railways, and he was brought to trial on the charge of treasonable negligence after an investigation in March. He was afterwards imprisoned before the final sentence was rendered. Among the activities of the Duma may be mentioned efforts to promote railway extension and coöperative enterprise and to enforce economy. To the last-named end, measures were taken for enforcing temperance and for dispensing with meat for several days of the week. Also a law was passed prohibiting permanently the sale and consumption of vodka and wines were prohibited except those which had less than 12 per cent of alcohol. By an important measure passed on July 2nd the peasants, who since 1890 had not the right to vote for deputies to the Zemstvos but only to make a list of candidates from which the provisional governor made a choice, acquired the same civil rights as those possessed by other classes. The session of the Duma was suspended on July 3rd until November 14th. Later in July the Foreign Minister, M. Sazonoff, resigned on the ground of ill-health and the Premier, himself, temporarily succeeded him. At the same time, M. Khvostov resumed the control of the Interior and M. Makarov that of Justice. The resignation of M. Sazonoff was greatly deplored and by the Liberal element was believed to have been forced by M. Stürmer, and taken as another proof of his reactionary policy.

**CABINET CRISIS.** The meeting of the Duma on November 14th was soon followed by the overturn of the Stürmer ministry, against which many grievances had accumulated. Stürmer was charged with attempting to muzzle public opinion, with appointing extreme reactionaries to cabinet posts, with taking undue advantage of the government's privilege of enacting laws without the coöperation of the Duma, with enforcing obnoxious measures during the intermission of the session, and above all with endeavoring to repress altogether the popular organizations formed for raising funds and otherwise aiding in the prosecution of the war. These organizations, expressing at the same time a democratic tendency and a desire to support the government in the vigorous prosecution of the war, included such bodies as the All-Russian Zemetvo Union, the Union of Municipalities, and the War Industries Committee, which had contributed vast sums in aid of the military. The Stürmer ministry in April decided to forbid the meeting of such organizations, and in spite of the protests that followed, the government issued an order on October 4th placing all their meetings under the supervision of the police. This was interpreted by many as an effort to repress popular coöperation toward the winning of the war. The appointment as Minister of the Interior of M. Protopopoff, who was suspected of German leanings, also aroused much criticism.

These and other causes of complaint united all factions against the government. Finally on November 27th, the Ministers of War and Marine demanded united efforts toward the winning of victory, and in effect declared themselves on the side of the Duma. Meanwhile Stürmer resigned and on November 24th M. Alexander Trepoff, Minister of Ways and Communications, succeeded as Premier. On December 14th the appointment of M. Pokrovsky as Foreign Minister was announced. The year

closed with a stormy session of the Duma in which Professor Milukoff, leader of the Constitutional Democrats, assailed the government and was followed by several speakers who reported sensational instances of negligence in the prosecution of the war. The Duma passed a resolution referring to certain "dark forces" tending to undermine the nation's energies and cause disorganization in all departments. A like resolution was passed by the Imperial Council and the Council of Nobles. The critics of the government declared that a complete change was necessary in all departments. Another resolution of the Duma condemned the course of the authorities in prohibiting meetings of the Zemstvo, and declared that the Duma welcomed the patriotic work of these bodies engaged in national defense. The action of the Duma was received with great satisfaction by the organizations concerned and at the close of December Prince Lvov, President of the Union of the Zemstvos, and M. Tchelnokov, President of the Union of Municipalities, together with the representatives of many other social organizations, sent telegrams congratulating the Ministers of War and Marine on their patriotic speeches in the Duma. Messages of congratulation were also sent to the leaders in the Duma for their part in bringing about the change of attitude.

**OTHER EVENTS.** On January 2nd, the Czar, while reviewing the Knights of St. George, declared that the war would not cease until the soil had been cleared of invaders, and that Russia would not make a separate peace. On March 18th, it was reported that the Poutilov factories were sequestered on the ground that they had come under German control. Delegates from the Russian Duma paid a visit in May to Great Britain and France. The election of the Finnish Diet resulted in the following distribution of parties: Social Democrats, 103; Old Finns, 33; Young Finns, 22; Swedes, 21; Agrarians, 19. On May 8th representatives of the French government paid a visit to Russia. On May 25th the 25th anniversary of the alliance with France was celebrated. For the political convention with Japan signed on July 6th, see JAPAN, *History*. On September 23rd the Czar approved the plan for creating a ministry of public health. On November 21st, an explosion at Bakaritz, near Archangel, was reported to have killed 341 persons and injured nearly twice that number. See RASPUTIN, GREGORY.

**RUSSIAN BALLET.** See MUSIC, *Ballet*.

**RUSSIAN LITERATURE.** The war has made communication with Russia difficult and several months often pass before Russian books may reach this side of the Atlantic. To avoid undue delay the reviewer must therefore content himself with an incomplete record of the year's literary history. As a partial offset, however, reference will be made to a few titles omitted in the NEW INTERNATIONAL YEAR BOOK FOR 1915.

Russian poetry has remained pretty much what it was before the war.\* Among the best collections of verse which appeared this year may be mentioned those of Brinsev (1912-15), Ashukin (1913-15), S. Soloviev (1913-15), and Constantine Bolshakov (1915-16). The elegant Balmont, the original Gumilev, the genial Mandelstam have once more evinced their characteristic

mastery of form and expression. To these should be added the melancholy Parnok, the country-loving Sergius Esenin, the "symbolist" Kliuiev, and Viacheslav Ivanov who (in *Two Cities*) views man and his destiny from the heights of philosophical contemplation. Other typical representatives of modern Russian poetry are the "acmeist" M. Struve, the "egofuturist" Igor Sevérianin, Sergius Rafalovich, Rurik Ivirev, and V. Gorodets. Alexander Bloch has published an edition of Apollon Grigoreev and an interesting essay on the Magic of Poetry. Among poetic translations may be noted N. M. Galikovski's rendering of the *Servian Epic* of the Kosovo Cycle.

Theatrical history was uneventful in 1916 despite the appearance of Count Alexis Tolstói's comedy, *Impure Strength*, and of Dmitri Merezhkovski's *There Shall Be Joy*. The family drama of S. Shimanski, *Blood*, which creates an interesting type of a Russian businessman, and Vinichenko's psychological drama, *The Lie*, are not without merit. Leonid Andreev's *Youth* does not present real, live personages or dramatic situations. In this connection is worth noting I. I. Ignatov's *Theatre and Spectators*, a collection of essays describing the Russian stage of the first half of the nineteenth century; and Bloch's collection of his plays written between 1898 and 1904.

An important event was marked by publication by Vladimir Chertkov of Tolstói's *Diary*, the first volume of which embraces the years 1895-99. The second volume has not as yet left the press, but its contents may be gathered from A. Khiriakov's extracts published in the periodical *Létopis*. It covers the period from 1847 to 1853 when the great writer was struggling against "doubt and temptation." The *Memoirs* of the Decembrist Gorbachevski are not without historic interest. Here belongs also Gorki's *Among People*, which recounts the tribulations of young Aliesha Peshkov making his apprenticeship in life.

Russian *Intelligentsia* and the revolutionary movement have provided the theme of several novels: Grigoreev's *Lately*, as yet unfinished, A. P. Krandevskaia's *Joy's Secret*, a masterly portrayal of certain aspects of that movement, and Biely's *Petersburg*, a long drawn work, artificial in its conception and not free from mannerism in its composition. In *I Will!* Vinichenko modernizes the well-known figure of Oblomov. Another psychological novel is *Doctor Orlov* by G. Magnitski, who paints in bold strokes the figure of a man who succumbs to his passion. Alexis Tolstói's *Worldly Treasures* contrasts an old generation whose interests centre in material things with a new which looks on inward perfection as the goal of life. The sex problem which has hitherto loomed in the work of Artsybashev, Kuprin (whose *Pit* has appeared in volume form), Kuzmin, and Slezkin (*Olga Orga*) is represented by Anna Marr's *Woman on the Cross*. Artsybashev himself is the author of *The Slave*, a violent diatribe against the subjection of woman by man, devoid of literary merit.

Few Russian authors evince sympathy for war as such. Andreev's novel in diary form, *The Yoke of War*, expressly adopts the individualistic standpoint of the plain man for whom war is a calamity. Kurbatov's novel in war setting, *The Journalist*, has nothing to recommend

\* The attitude of the Russian proletarian poets toward the war is dealt with in an article by A. Kleinbort in the March issue of *Souremenny Mir*.

Y. B. 16—21.

it except its plot. There have appeared numerous volumes made up in whole or in part of war stories by Fedor Sologub, Vladislav Voinov, Skitalets (Petrov), N. Morozov, Boris Lazarevski, S. Auslender, Iuri Slezkin (*Holy Joy*, 1915), Prince Bebutova, and others. The best stories are, perhaps, Ivan Shmelev's *On the Highway* (1915), a masterpiece of realism in which, however, the war does not appear directly, but we are made to witness its echoes in the minds of the people left at home, and *His Choir Invisible*, a picture of war in its external, not its psychological, aspect. The number of stories which have war as a theme or a background is nevertheless relatively small. A list of the best among the others must include the *Provincial Stories* of Dobronravov, the *Forest Tales* of Kasatkin, the Tatar tales of Krasheninikov, *Children* and other stories of D. Aisman, the Viatka tales of D. K. Zelenin, the Siberian of Grevischikov, not to mention the new volumes of Kuprin, Verbitakiaia, Zaitsev (*Earthly Sorrows*), Andreev, and Al. Tolstoi (*Sparks*). Of single stories, Ivan Bunin's *Gentleman from San Francisco* (1915; available in English in the *Russian Review*), Trenev's *By the Quiet Water* (1915), Slezkin's *Deep Heart*, Surguchev's *Neighbor*, and Veresaev's *Grandfather* are gems of unsurpassed beauty.

The student of literary history will notice such works as Pypin's *Religious Movement Under Alexander I* and *History of Russian Freemasons*; Bogolubov's study of Novikov; and the third volume of *Russkie Propilei*, edited by M. Gershenzon, which deals with Turgenev, and must regret the death of the sociologist and historian Maxim Kovaleski.

Among new periodicals, the *Russian Memoirs* (Zapiski) takes the place of the defunct *Russkoe Bogatstvo*, and the *Siberian Memoirs* are worth noting as evidence of the literary awakening of Siberia.

Among the Russian authors who appeared in English translation may be mentioned S. Aksakov (*Years of Childhood*), Artsybashev (*War*), Andreev, Chekhov (*Plays and Stories*), Dauchenko, Garshin (*The Signal*, etc.), Goucharov (*Oblomov*), Fedor Sologub (*Little Demon, Old House*), Potapenko (*Forest*), and Veresaev (*Memoirs of a Physician*), and in addition numerous tales and poems.

**RUSSIAN SYMPHONY ORCHESTRA.** See **MUSIC. Orchestras.**

**RUTGERS COLLEGE.** A non-sectarian institution for the education of men at New Brunswick, N. J., founded in 1766. In the fall of 1916 the total enrollment of students was 1292. The faculty numbered 64. During the year Julius Nelson, professor of biology, and Rev. Charles E. Hart, professor emeritus of ethics, died, and Clarence Ward, associate professor of architecture, and Cullen W. Parmelee, professor of ceramics, accepted calls to other institutions. Following are the more important new appointments: Rev. Ferdinand S. Schenck, professor of ethics; A. R. Moore, professor of physiology; G. H. Brown, professor of ceramics; C. B. Lewis, M.D., college physician. The productive funds of the college amount to \$766,388, and in 1916 its income was \$298,153. The library contains 86,913 volumes and receives regularly over 2000 periodicals. On Oct. 12, 1916, Rutgers College celebrated with a pageant and other impressive ceremonies the 150th anniversary of its founding

in 1766 as Queen's College. At this time a campaign to raise a permanent endowment fund of \$1,000,000 was initiated, and up to the end of the year over \$250,000 had been received in pledges. In addition to this amount the benefactions of the year totaled some \$70,000. President, William Henry Steele Demarest.

**RYE.** The world's rye production in 1916 was only slightly less than that of 1915 and consequently large enough to meet the requirements for consumption. The production of the northern hemisphere for the year, according to estimates by the International Institute of Agriculture, Rome, was 1,868,579,700 bushels, a figure representing 98.8 per cent of the production of the preceding year and 106.9 per cent of the average for the five years 1909-13. In this estimate the five years' average is substituted for the yield in 1916 of a number of European countries not furnishing data under the conditions of war. The yields of Portugal, Serbia, Turkey in Europe and Asia, Mexico, and Algeria, roughly placed at about 27,500,000 bushels, in the absence of recent data are not included in the above estimate. The production for 1915-16 in the southern hemisphere was estimated at 2,255,000 bushels. The requirements of the northern hemisphere for the year are placed at 1,862,969,900 bushels and the available supply, including the remainders of the preceding crop in the northern and southern hemispheres at 1,977,552,220 bushels, leaving a surplus of 114,582,320 bushels. The world's yearly seed requirements included in the above figure are estimated to be about 247,000,000 bushels. There was practically no international trade in rye during the year. Maximum and requisition prices were fixed by law in Germany, Austria, and Hungary, and the exportation of rye was prohibited or else greatly restricted in practically all European countries.

The rye crop of 1916 in the United States, as estimated by the Department of Agriculture, was 47,383,000 bushels, produced on 3,096,000 acres at the rate of 15.3 bushels per acre. The corresponding figures for the preceding crop were 54,050,000 bushels, 3,129,000 acres, and 17.3 bushels. The average farm value on Dec. 1, 1916, was 122.1 cents per bushel and the total value of the crop on this basis was \$57,857,000, both figures being the highest on record. The average value per acre on Dec. 1, 1916, was \$18.60. The leading rye producing States and their yields were as follows: Wisconsin, 6,075,000; Minnesota, 5,025,000; North Dakota, 4,655,000; Michigan, 4,648,000; South Dakota, 4,500,000; Pennsylvania, 4,420,000, and Nebraska, 3,072,000 bushels. About 80 per cent of the acreage in rye was in the eastern half of the country. The Canadian rye crop of 1916 was about 84 per cent of normal.

**ST. ALDWYN, MICHAEL EDWARD HICKS-BEACH,** first Earl. A British statesman, died at Fairford, Gloucestershire, April 30, 1916. Son of the eighth baronet named Hicks-Beach, whom he succeeded in 1854, Earl St. Aldwyn was born in 1837, and for most of his life was known by his family name. After an education at Eton and at Christ Church, Oxford, where he took the M.A., he entered politics and for 22 years he served continuously in Parliament, from 1864

to 1885 as Conservative member for East Gloucestershire and thereafter till his retirement in 1906 as member for West Bristol. After holding minor posts, he was appointed Chief Secretary for Ireland in 1874, and in 1878 Secretary for the Colonies, an office that he held for two years. From 1880 to 1885, during the administration of Gladstone, Hicks-Beach made violent attacks on Liberal policies, and it was a budget amendment proposed by him which brought about the defeat of the Gladstone government in 1885. For a short time thereafter he was leader of the House, was Chancellor of the Exchequer in 1885-86, and for a year returned to the office of Secretary for Ireland, after the Conservatives had defeated the Home Rule Bill. From 1888 to 1892, Sir Michael served as president of the Board of Trade, but he became best known during his second incumbency of the Chancellorship of the Exchequer (1895-1902), his administration being notable for economy. At this time his speeches on British foreign policy, especially in Egypt and China, attracted wide attention, and he it was who originated the expression "the open door in China." After his retirement from office he became a leader of the Conservative Free Traders, and in 1905, after giving up his seat in the House, he traveled to Japan. In 1906 he was created Viscount St. Aldwyn, and in 1915 Earl. His only son, Viscount Quenington, was killed in battle in France only a week before his father died.

**ST. CHRISTOPHER.** See **ST. KITTS AND NEVIS.**

**ST. HELENA.** A British island in the south Atlantic Ocean. Area, 47 square miles; population (1911), 3520. Capital, Jamestown (1439).

**ST. JOHN, JOHN PIERCE.** An American prohibition leader, died at Olathe, Kan., Aug. 31, 1916. He was born at Brookville, Ind., in 1833. During the Civil War he fought in the Union army, rising to the rank of lieutenant-colonel. Afterward, settling in Kansas, he was a member of the State Senate in 1872-73, and gained State-wide attention by a successful fight to bring about the defeat of United States Senator Samuel E. Pomeroy. Elected Governor of Kansas in 1879 and re-elected two years later, Mr. St. John used his influence to make the State "dry," and during the time that he held office a prohibition amendment to the constitution was passed by the Legislature. Thus far he had been identified with the Republican party; but in 1884 he accepted from the Prohibition party the nomination for the presidency. His change roused much bitterness. During the campaign he was burned in effigy hundreds of times and was twice shot at, but was uninjured. Many Republicans held that if St. John had supported Blaine, Cleveland would have been defeated. As it was, St. John polled 151,809 votes.

**ST. KITTS (or ST. CHRISTOPHER) AND NEVIS.** A presidency of the **LEEWARD ISLANDS** (q.v.).

**ST. LOUIS.** See **EDUCATION IN THE UNITED STATES.**

**ST. LUCIA.** One of the (British) Windward Islands colonies. Area 233 square miles, population (1911), 48,637. Capital, Castries (population given as 6266).

**SAINT-PIERRE AND MIQUELON.** A French island colony off the southeastern coast of Newfoundland, including some smaller islands.

The total area is 241 square kilometers (93 square miles), with a population of 6482.

**SAINT-SAËNS, CAMILLE.** See **MUSIC, France.**

**ST. THOMAS.** See **SÃO THOMÉ.**

**ST. VINCENT.** One of the (British) Windward Islands colonies. Area, between 140 and 150 square miles; population, 41,877. Capital, Kingstown (4300).

**SAKHALIN.** An island off the eastern coast of Siberia; divided by the 50th parallel into Russian Sakhalin, with 14,688 square miles and about 34,000 inhabitants, and the Japanese territory of Karafuto, with 13,155 square miles and about 50,000 inhabitants. Its fisheries are valuable and timber is abundant.

**SALONIKI.** See **WAR OF THE NATIONS.**

**SALVADOR.** The smallest of the American republics, situated on the Pacific coast of Central America and bounded by Guatemala and Honduras.

**AREA, POPULATION, ETC.** The area of Salvador has been calculated at 21,160 square kilometers (8170 square miles). According to another estimate, the area is 7225 square miles. The population as calculated for the end of 1915 was 1,267,762. Nearly two-thirds of the people are mestizos and nearly one-sixth Indians. Although the pure white element is small, Salvador has achieved a considerable degree of economic development and political stability. The average annual increase of population during the ten years ended 1915 is reported at 22,000. Marriages in 1914 and 1915 respectively: 4013 and 3886; births, 51,859 and 51,058; deaths, 25,413 and 37,447. The population of the capital, San Salvador, is estimated at 66,800 (or, with its rural districts, 75,000); Santa Ana, 48,000 (59,400); San Miguel, 25,000 (30,000).

Primary instruction is free and nominally compulsory. The total enrollment in public and private primary schools in 1913 was 50,560; in the following year children of school age (six to fourteen) were reported to number about 274,000. There are three normal, three technical, and a number of other schools of advanced rank, besides a national university.

**PRODUCTION, COMMERCE, ETC.** Agriculture is the principal occupation of the people. The chief crop is coffee. The area under coffee is about 211,000 acres; the 1916 crop was estimated at 750,000 quintals (of 101 pounds), as compared with 770,000 quintals in 1915. Other important products are bananas, cacao, sugar cane, rice, corn, tobacco, indigo, and balsam. There is some mining, especially of gold and silver.

In 1914, imports were valued at \$4,958,614 and exports at 26,991,237 pesos (silver). The chief imports are cotton goods, hardware, drugs and medicine, machinery, and flour. Coffee is represented by nearly four-fifths of the total export value. The coffee export in 1914 amounted to nearly 62,600,000 pounds, valued at 22,544,252 pesos; gold and silver ore, 1,905,334 pesos; gold bullion, 1,284,666; auriferous silver, 261,464; indigo, 247,152; sugar, 209,128; balsam, 206,799; cattle hides, 121,353. By countries, import values and export values (computed at

40 cents the peso) have been as follows, in thousands of dollars:

	Imports		Exports	
	1913	1914	1913	1914
United States .....	2,491	2,028	2,824	2,862
